

# DDR3L SDRAM Unbuffered DIMMs Based on 2Gb A-Die

HMT325U7AFR8A  
HMT351U7AFR8A

\* Hynix Semiconductor reserves the right to change products or specifications without notice.

## Revision History

Revision No.	History	Draft Date	Remark
0.1	Initial Release	Nov. 2009	Preliminary

## Description

Hynix Unbuffered DDR3L SDRAM DIMMs (Unbuffered Double Data Rate Synchronous DRAM Dual In-Line Memory Modules) are low power, high-speed operation memory modules that use Hynix DDR3L SDRAM devices. These Unbuffered SDRAM DIMMs are intended for use as main memory when installed in systems such as PCs and workstations.

## Features

- Power Supply: VDD=1.35V (1.283V to 1.45V)
- VDDQ=1.35V (1.283 to 1.45V)
- Backward Compatible with 1.5V DDR3 Memory module
- VDDSPD=3.0V to 3.6V
- Functionality and operations comply with the DDR3 SDRAM datasheet
- 8 internal banks
- Data transfer rates: PC3-10600, PC3-8500
- Bi-directional Differential Data Strobe
- 8 bit pre-fetch
- Burst Length (BL) switch on-the-fly:BL8 or BC (Burst Chop)4
- Supports ECC error correction and detection
- On-Die Termination (ODT) supported
- Temperature sensor with integrated SPD (Serial Presence Detect) EEPROM
- RoHS compliant

\* This product is in compliance with the RoHS directive.

## Ordering Information

Part Number	Density	Organization	Component Composition	# of ranks	FDHS
HMT325U7AFR8A - G7/H9	2GB	256Mx72	256Mx8(H5TC2G83AFR)*9	1	X
HMT351U7AFR8A - G7/H9	4GB	512Mx72	256Mx8(H5TC2G83AFR)*18	2	X

## Key Parameters

MT/s	Grade	tCK (ns)	CAS Latency (tCK)	tRCD (ns)	tRP (ns)	tRAS (ns)	tRC (ns)	CL-tRCD-tRP
DDR3-1066	-G7	1.875	7	13.125	13.125	37.5	50.625	7-7-7
DDR3-1333	-H9	1.5	9	13.5	13.5	36	49.5	9-9-9

## Speed Grade

Grade	Frequency [MHz]					Remark
	CL6	CL7	CL8	CL9	CL10	
-G7	800	1066	1066			
-H9	800	1066	1066	1333	1333	

## Address Table

	2GB(1Rx8)	4GB(2Rx8)
Refresh Method	8K/64ms	8K/64ms
Row Address	A0-A13	A0-A13
Column Address	A0-A9	A0-A9
Bank Address	BA0-BA2	BA0-BA2
Page Size	1KB	1KB

## Pin Descriptions

Pin Name	Description	Pin Name	Description
A0–A15	SDRAM address bus	SCL	I <sup>2</sup> C serial bus clock for EEPROM
BA0–BA2	SDRAM bank select	SDA	I <sup>2</sup> C serial bus data line for EEPROM
$\overline{\text{RAS}}$	SDRAM row address strobe	SA0–SA2	I <sup>2</sup> C slave address select for EEPROM
$\overline{\text{CAS}}$	SDRAM column address strobe	VDD*	SDRAM core power supply
$\overline{\text{WE}}$	SDRAM write enable	VDDQ*	SDRAM I/O Driver power supply
$\overline{\text{S0}}\text{--}\overline{\text{S1}}$	DIMM Rank Select Lines	VREFDQ	SDRAM I/O reference supply
CKE0–CKE1	SDRAM clock enable lines	VREFCA	SDRAM command/address reference supply
ODT0–ODT1	On-die termination control lines	VSS	Power supply return (ground)
DQ0–DQ63	DIMM memory data bus	VDDSPD	Serial EEPROM positive power supply
CB0–CB7	DIMM ECC check bits	NC	Spare pins (no connect)
DQS0–DQS8	SDRAM data strobes (positive line of differential pair)	TEST	Memory bus analysis tools (unused on memory DIMMS)
$\overline{\text{DQS0}}\text{--}\overline{\text{DQS8}}$	SDRAM data strobes (negative line of differential pair)	RESET	Set DRAMs to Known State
DM0–DM8	SDRAM data masks/high data strobes (x8-based x72 DIMMs)	VTT	SDRAM I/O termination supply
CK0–CK1	SDRAM clocks (positive line of differential pair)	RFU	Reserved for future use
$\overline{\text{CK0}}\text{--}\overline{\text{CK1}}$	SDRAM clocks (negative line of differential pair)	-	-
<b>*The VDD and VDDQ pins are tied common to a single power-plane on these designs</b>			

## Input/Output Functional Descriptions

Symbol	Type	Polarity	Function
$\overline{\text{CK0}}\text{--}\overline{\text{CK1}}$ $\text{CK0}\text{--}\text{CK1}$	SSTL	Differential crossing	CK and $\overline{\text{CK}}$ are differential clock inputs. All the DDR3L SDRAM addr/cntl inputs are sampled on the crossing of positive edge of CK and negative edge of $\overline{\text{CK}}$ . Output (read) data is reference to the crossing of CK and $\overline{\text{CK}}$ (Both directions of crossing).
CKE0–CKE1	SSTL	Active High	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
$\overline{\text{S0}}\text{--}\overline{\text{S1}}$	SSTL	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks.
$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{WE}}$	SSTL	Active Low	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , and $\overline{\text{WE}}$ (ALONG WITH $\overline{\text{S}}$ ) define the command being entered.
ODT0–ODT1	SSTL	Active High	When high, termination resistance is enabled for all DQ, DQS, $\overline{\text{DQS}}$ and DM pins, assuming this function is enabled in the Mode Register 1 (MR1).
VREFDQ	Supply		Reference voltage for SSTL15 I/O inputs.
VREFCA	Supply		Reference voltage for SSTL 15 command/address inputs.
VDDQ	Supply		Power supply for the DDR3L SDRAM output buffers to provide improved noise immunity. For all current DDR3L unbuffered DIMM designs, VDDQ shares the same power plane as VDD pins.
BA0–BA2	SSTL	—	Selects which SDRAM bank of eight is activated.
A0–A15	SSTL	—	During a Bank Activate command cycle, Address input defines the row address (RA0–RA15). During a Read or Write command cycle, Address input defines the column address. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0, BA1, BA2 defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0, BA1, BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0, BA1 or BA2. If AP is low, BA0, BA1 and BA2 are used to define which bank to precharge. A12( $\overline{\text{BC}}$ ) is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed (HIGH, no burst chop; LOW, burst chopped).
DQ0–DQ63, CB0–CB7	SSTL	—	Data and Check Bit Input/Output pins.
DM0–DM8	SSTL	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
VDD, VSS	Supply		Power and ground for the DDR3 SDRAM input buffers, and core logic. VDD and VDDQ pins are tied to VDD/VDDQ planes on these modules.

Symbol	Type	Polarity	Function
$\overline{\text{DQS0}}\text{--}\overline{\text{DQS8}}$ $\text{DQS0}\text{--}\text{DQS8}$	SSTL	Differential crossing	Data strobe for input and output data.
SA0–SA2		—	These signals are tied at the system planar to either Vss or VDDSPD to configure the serial SPD EEPROM address range.
SDA		—	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. An external resistor may be connected from the SDA bus line to VDDSPD to act as a pullup on the system board.
SCL		—	This signal is used to clock data into and out of the SPD EEPROM. An external resistor may be connected from the SCL bus time to VDDSPD to act as a pullup on the system board.
VDDSPD	Supply		Power supply for SPD EEPROM. This supply is separate from the VDD/VDDQ power plane. EEPROM supply is operable from 3.0V to 3.6V.

## Pin Assignments

Front Side(left 1–60)			Back Side(right 121–180)			Front Side(left 61–120)			Back Side(right 181–240)

## On DIMM Thermal Sensor

The DDR3L SDRAM DIMM temperature is monitored by integrated thermal sensor. The integrated thermal sensor comply with JEDEC "TSE2002av, Serial Presence Detect with Temperature Sensor".

### Connection of Thermal Sensor

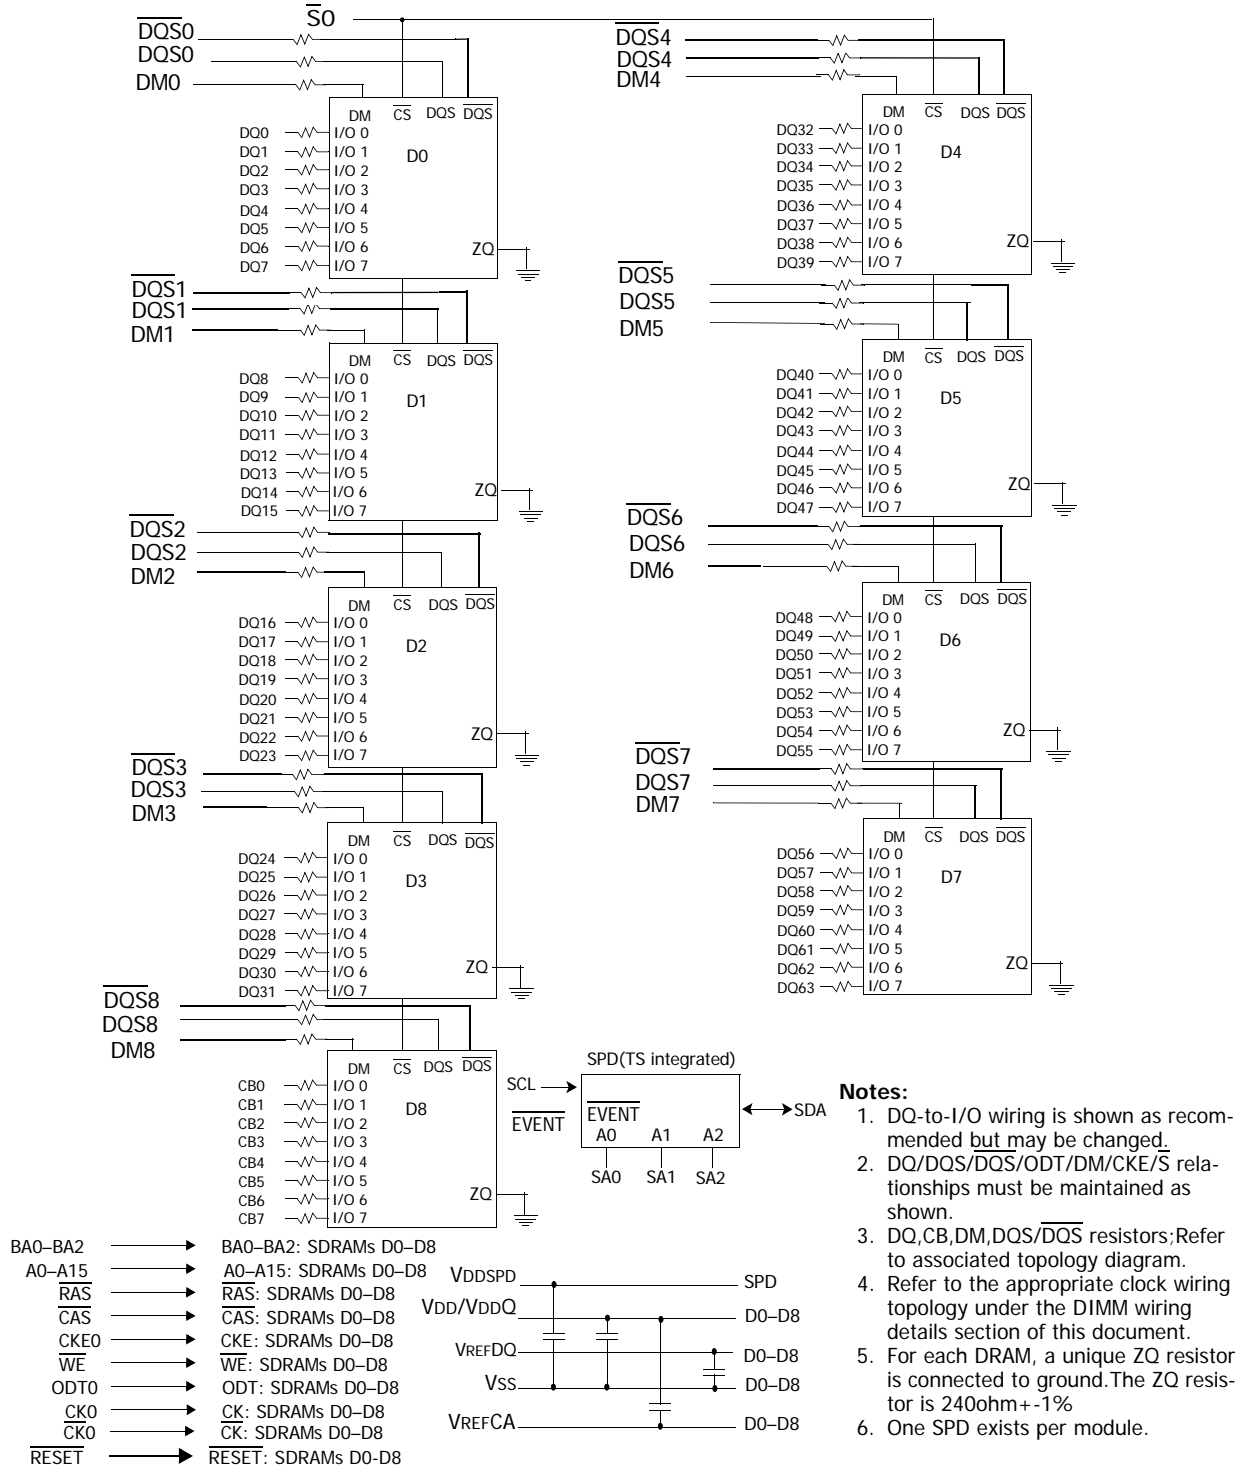

### Temperature-to-Digital Conversion Performance

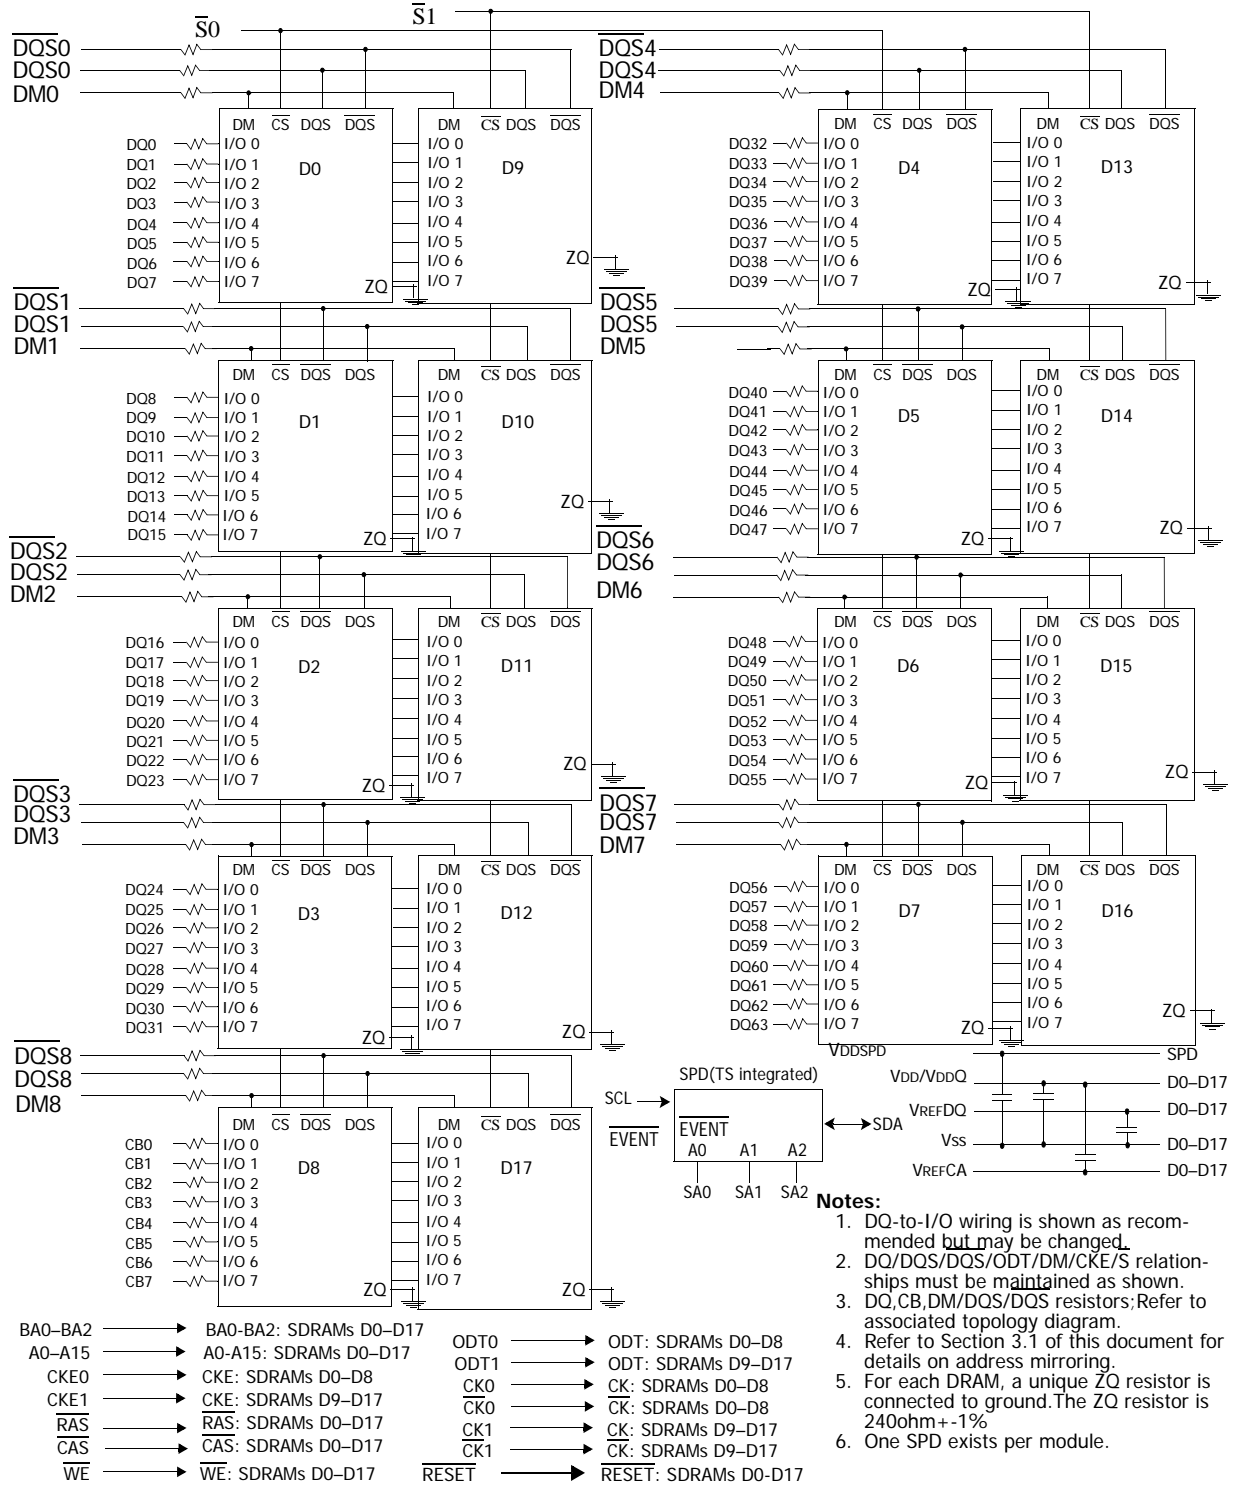

Parameter	Condition	Min	Typ	Max	Unit
Temperature Sensor Accuracy (Grade B)	Active Range, $75^{\circ}\text{C} < T_A < 95^{\circ}\text{C}$	-	$\pm 0.5$	$\pm 1.0$	$^{\circ}\text{C}$
	Monitor Range, $40^{\circ}\text{C} < T_A < 125^{\circ}\text{C}$	-	$\pm 1.0$	$\pm 2.0$	$^{\circ}\text{C}$
	$-20^{\circ}\text{C} < T_A < 125^{\circ}\text{C}$	-	$\pm 2.0$	$\pm 3.0$	$^{\circ}\text{C}$
Resolution			0.25		$^{\circ}\text{C}$

# Functional Block Diagram

## 2GB, 256Mx72 Module(1Rank of x8)

### 4GB, 512Mx72 Module(2Rank of x8)

## Absolute Maximum Ratings

### Absolute Maximum DC Ratings

#### Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
VDD	Voltage on VDD pin relative to Vss	- 0.4 V ~ 1.975 V	V	1,
VDDQ	Voltage on VDDQ pin relative to Vss	- 0.4 V ~ 1.975 V	V	1,
V <sub>IN</sub> , V <sub>OUT</sub>	Voltage on any pin relative to Vss	- 0.4 V ~ 1.975 V	V	1
T <sub>STG</sub>	Storage Temperature	-55 to +100	°C	1, 2

#### Notes:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JEDEC standard.
3. VDD and VDDQ must be within 300mV of each other at all times; and VREF must not be greater than 0.6XVDDQ, When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV.

### DRAM Component Operating Temperature Range

#### Temperature Range

Symbol	Parameter	Rating	Units	Notes
T <sub>OPER</sub>	Normal Operating Temperature Range	0 to 85	°C	1,2
	Extended Temperature Range	85 to 95	°C	1,3

#### Notes:

1. Operating Temperature TOPER is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 - 85°C under all operating conditions.
3. Some applications require operation of the DRAM in the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
  - a. Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 μs. It is also possible to specify a component with 1X refresh (tREFI to 7.8μs) in the Extended Temperature Range. Please refer to the DIMM SPD for option availability
  - b. If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b)

## AC & DC Operating Conditions

### Recommended DC Operating Conditions

#### Recommended DC Operating Conditions - DDR3L (1.35V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.283	1.35	1.45	V	1,2,3,4
VDDQ	Supply Voltage for Output	1.283	1.35	1.45	V	1,2,3,4

**Notes:**

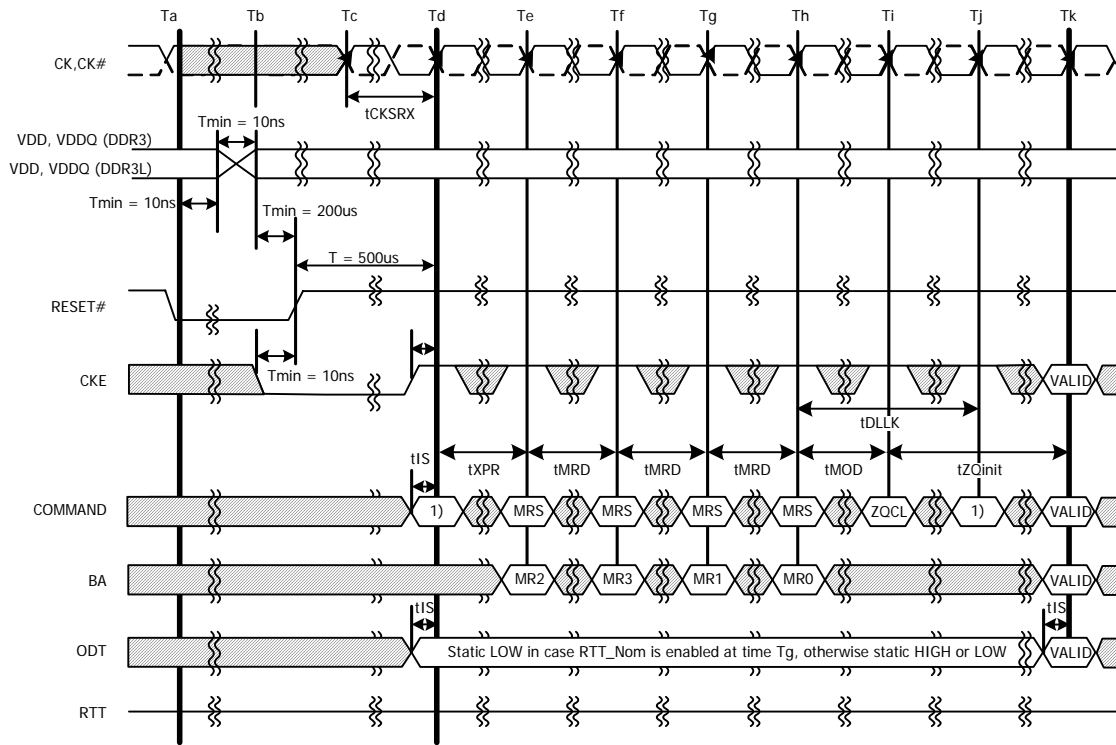

1. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of VDD/VDDQ (t) over a very long period of time (e.g., 1 sec).
2. If maximum limit is exceeded, input levels shall be governed by DDR3L specifications.
3. Under these supply voltages, the device operates to this DDR3L specification.
4. Once initialized for DDR3L operation, DDR3 operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3 operation (see Figure 0).

#### Recommended DC Operating Conditions - - DDR3 (1.5V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.425	1.5	1.575	V	1,2,3
VDDQ	Supply Voltage for Output	1.425	1.5	1.575	V	1,2,3

**Notes:**

1. If minimum limit is exceeded, input levels shall be governed by DDR3L specifications.
2. Under 1.5V operation, this DDR3L device operates to the DDR3 specifications under the same speed timings as defined for this device.
3. Once initialized for DDR3 operation, DDR3L operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3L operation (see Figure 0).

NOTE 1: From time point "Td" until "Tk" NOP or DES commands must be applied between MRS and ZQCL commands.

}} TIME BREAK    ▨ DON'T CARE

Figure 0 - VDD/VDDQ Voltage Switch Between DDR3L and DDR3

## AC & DC Input Measurement Levels

### AC and DC Logic Input Levels for Single-Ended Signals

### AC and DC Input Levels for Signal-Ended Command and Address Signals

#### Single Ended AC and DC Input Levels for Command and Address

Symbol	Parameter	DDR3L-800/1066/1333		Unit	Notes
		Min	Max		
VIH.CA(DC90)	DC input logic high	Vref + 0.09	VDD	V	1
VIL.CA(DC90)	DC input logic low	VSS	Vref - 0.09	V	1
VIH.CA(AC160)	AC input logic high	Vref + 0.160	Note2	V	1, 2
VIL.CA(AC160)	AC input logic low	Note2	Vref - 0.160	V	1, 2
VIH.CA(AC135)	AC Input logic high	Vref + 0.135	Note2	V	1, 2
VIL.CA(AC135)	AC input logic low	Note2	Vref - 0.135	V	1, 2
$V_{RefCA(DC)}$	Reference Voltage for ADD, CMD inputs	0.49 * VDD	0.51 * VDD	V	3, 4

#### Notes:

1. For input only pins except  $\overline{RESET}$ , Vref = VrefCA (DC).
2. Refer to "Overshoot and Undershoot Specifications" on page 29.
3. The ac peak noise on  $V_{Ref}$  may not allow  $V_{Ref}$  to deviate from  $V_{RefCA(DC)}$  by more than +/-1% VDD (for reference: approx. +/- 13.5 mV).
4. For reference: approx. VDD/2 +/- 13.5 mV
5. These levels apply for 1.35 volt (see table above) operation only. If the device is operated at 1.5V (table "Single Ended AC and DC Input Levels for DQ and DM" on page 17), the respective levels in JESD79-3 (VIH/L.CA(DC100), VIH/L.CA(AC175), VIH/L.CA(AC150), etc.) apply. The 1.5V levels (VIH/L.CA(DC100), VIH/L.CA(AC175), VIH/L.CA(AC150), etc.) do not apply when the device is operated in the 1.35 voltage range.

## AC and DC Input Levels for Signal-Ended Signals

DDR3 SDRAM will support two  $V_{ih}/V_{il}$  AC levels for DDR3-800 and DDR3-1066 as specified in table below. DDR3 SDRAM will also support corresponding tDS values (Table 41 on page 120 and Table 47 on page 145 in "DDR3L Device Operation") as well as derating tables Table 44 on page 139 in "DDR3L Device Operation" depending on  $V_{ih}/V_{il}$  AC levels.

### Single Ended AC and DC Input Levels for DQ and DM

Symbol	Parameter	DDR3L-800/1066		DDR3L-1333		Unit	Notes
		Min	Max	Min	Max		
VIH.CA(DC90)	DC input logic high	$V_{ref} + 0.09$	VDD	$V_{ref} + 0.09$	VDD	V	1
VIL.CA(DC90)	DC input logic low	VSS	$V_{ref} - 0.09$	VSS	$V_{ref} - 0.09$	V	1
VIH.CA(AC160)	AC input logic high	$V_{ref} + 0.160$	Note2	-	-	V	1, 2,5
VIL.CA(AC160)	AC input logic low	Note2	$V_{ref} - 0.160$	-	-	V	1, 2,5
VIH.CA(AC135)	AC Input logic high	$V_{ref} + 0.135$	Note2	$V_{ref} + 0.135$	Note2	V	1, 2,5
VIL.CA(AC135)	AC input logic low	Note2	$V_{ref} - 0.135$	Note2	$V_{ref} - 0.135$	V	1, 2,5
$V_{RefDQ(DC)}$	Reference Voltage for DQ, DM inputs	$0.49 * VDD$	$0.51 * VDD$	$0.49 * VDD$	$0.51 * VDD$	V	3, 4

Notes:

1. For input only pins except  $\overline{RESET}$ ,  $V_{ref} = V_{refCA}$  (DC).
2. Refer to "Overshoot and Undershoot Specifications" on page 29.
3. The ac peak noise on  $V_{Ref}$  may not allow  $V_{Ref}$  to deviate from  $V_{RefDQ(DC)}$  by more than  $\pm 1\% VDD$  (for reference: approx.  $\pm 13.5$  mV).
4. For reference: approx.  $VDD/2 \pm 13.5$  mV
5. These levels apply for 1.35 volt (table above) operation only. If the device is operated at 1.5V (See table above), the respective levels in JESD79-3 ( $V_{IH}/L.CA(DC100)$ ,  $V_{IH}/L.CA(AC175)$ ,  $V_{IH}/L.CA(AC150)$ , etc.) apply. The 1.5V levels ( $V_{IH}/L.CA(DC100)$ ,  $V_{IH}/L.CA(AC175)$ ,  $V_{IH}/L.CA(AC150)$ , etc.) do not apply when the device is operated in the 1.35 voltage range.

## Vref Tolerances

The dc-tolerance limits and ac-noise limits for the reference voltages  $V_{\text{RefCA}}$  and  $V_{\text{RefDQ}}$  are illustrated in figure below. It shows a valid reference voltage  $V_{\text{Ref}}(t)$  as a function of time. ( $V_{\text{Ref}}$  stands for  $V_{\text{RefCA}}$  and  $V_{\text{RefDQ}}$  likewise).

$V_{\text{Ref}}(\text{DC})$  is the linear average of  $V_{\text{Ref}}(t)$  over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements in the table "Differential Input Slew Rate Definition" on page 24. Furthermore  $V_{\text{Ref}}(t)$  may temporarily deviate from  $V_{\text{Ref}}(\text{DC})$  by no more than  $\pm 1\% \text{ VDD}$ .

**Illustration of  $V_{\text{Ref(DC)}}$  tolerance and  $V_{\text{Ref}}$  ac-noise limits**

The voltage levels for setup and hold time measurements  $V_{\text{IH(AC)}}$ ,  $V_{\text{IH(DC)}}$ ,  $V_{\text{IL(AC)}}$ , and  $V_{\text{IL(DC)}}$  are dependent on  $V_{\text{Ref}}$ .

" $V_{\text{Ref}}$ " shall be understood as  $V_{\text{Ref(DC)}}$ , as defined in figure above.

This clarifies that dc-variations of  $V_{\text{Ref}}$  affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for  $V_{\text{Ref(DC)}}$  deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with  $V_{\text{Ref ac-noise}}$ . Timing and voltage effects due to ac-noise on  $V_{\text{Ref}}$  up to the specified limit ( $\pm 1\% \text{ VDD}$ ) are included in DRAM timings and their associated deratings.

## AC and DC Logic Input Levels for Differential Signals

### Differential signal definition

Definition of differential ac-swing and "time above ac-level"  $t_{DVAC}$

## Differential swing requirements for clock (CK - $\overline{\text{CK}}$ ) and strobe (DQS - $\overline{\text{DQS}}$ ) Differential AC and DC Input Levels

Symbol	Parameter	DDR3L-800, 1066, 1333		Unit	Notes
		Min	Max		
VIHdiff	Differential input high	+ 0.180	Note 3	V	1
VILdiff	Differential input logic low	Note 3	- 0.180	V	1
VIHdiff (ac)	Differential input high ac	2 x (VIH (ac) - Vref)	Note 3	V	2
VILdiff (ac)	Differential input low ac	Note 3	2 x (VIL (ac) - Vref)	V	2

### Notes:

- Used to define a differential signal slew-rate.
- For CK -  $\overline{\text{CK}}$  use VIH/VIL (ac) of AADD/CMD and VREFCA; for DQS -  $\overline{\text{DQS}}$ , DQSL,  $\overline{\text{DQSL}}$ , DQSU,  $\overline{\text{DQSU}}$  use VIH/VIL (ac) of DQs and VREFDQ; if a reduced ac-high or ac-low levels is used for a signal group, then the reduced level applies also here.
- These values are not defined; however, the single-ended signals CK,  $\overline{\text{CK}}$ , DQS,  $\overline{\text{DQS}}$ , DQSL,  $\overline{\text{DQSL}}$ , DQSU,  $\overline{\text{DQSU}}$  need to be within the respective limits (VIH (dc) max, VIL (dc) min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specifications" on page 29.

## Allowed time before ringback (tDVAC) for CK - $\overline{\text{CK}}$ and DQS - $\overline{\text{DQS}}$

Slew Rate [V/ns]	tDVAC [ps] @  VIH/Ldiff (ac)  = 350mV		tDVAC [ps] @  VIH/Ldiff (ac)  = 300mV	
	min	max	min	max
> 4.0	75	-	175	-
4.0	57	-	170	-
3.0	50	-	167	-
2.0	38	-	163	-
1.8	34	-	162	-
1.6	29	-	161	-
1.4	22	-	159	-
1.2	13	-	155	-
1.0	0	-	150	-
< 1.0	0	-	150	-

## Single-ended requirements for differential signals

Each individual component of a differential signal ( $\overline{CK}$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$ ,  $\overline{DQSU}$ ,  $\overline{CK}$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$ , or  $\overline{DQSU}$ ) has also to comply with certain requirements for single-ended signals.

$\overline{CK}$  and  $\overline{CK}$  have to approximately reach  $VSEH_{min}$  /  $VSEL_{max}$  (approximately equal to the ac-levels ( $V_{IH}(ac)$  /  $V_{IL}(ac)$ ) for ADD/CMD signals) in every half-cycle.

$\overline{DQS}$ ,  $\overline{DQSL}$ ,  $\overline{DQSU}$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$  have to reach  $VSEH_{min}$  /  $VSEL_{max}$  (approximately the ac-levels ( $V_{IH}(ac)$  /  $V_{IL}(ac)$ ) for DQ signals) in every half-cycle preceding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g., if  $V_{IH.CA}(AC150)/V_{IL.CA}(AC150)$  is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals  $\overline{CK}$  and  $\overline{CK}$ .

### Single-ended requirements for differential signals.

Note that, while ADD/CMD and DQ signal requirements are with respect to  $V_{ref}$ , the single-ended components of differential signals have a requirement with respect to  $V_{DD} / 2$ ; this is nominally the same. the transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach  $VSEL_{max}$ ,  $VSEH_{min}$  has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

### Single-ended levels for CK, DQS, DQSL, DQSU, $\overline{CK}$ , $\overline{DQS}$ , $\overline{DQSL}$ or $\overline{DQSU}$

Symbol	Parameter	DDR3-800, 1066, 1333, & 1600		Unit	Notes
		Min	Max		
VSEH	Single-ended high level for strobes	$(VDD / 2) + 0.175$	Note 3	V	1,2
	Single-ended high level for Ck, $\overline{CK}$	$(VDD / 2) + 0.175$	Note 3	V	1,2
VSEL	Single-ended low level for strobes	Note 3	$(VDD / 2) - 0.175$	V	1,2
	Single-ended low level for CK, $\overline{CK}$	Note 3	$(VDD / 2) - 0.175$	V	1,2

**Notes:**

1. For CK,  $\overline{CK}$  use VIH/VIL (ac) of ADD/CMD; for strobes (DQS,  $\overline{DQS}$ , DQSL,  $\overline{DQSL}$ , DQSU,  $\overline{DQSU}$ ) use VIH/VIL (ac) of DQs.
2. VIH (ac)/VIL (ac) for DQs is based on VREFDQ; VIH (ac)/VIL (ac) for ADD/CMD is based on VREFCA; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
3. These values are not defined; however, the single-ended signals Ck,  $\overline{CK}$ , DQS,  $\overline{DQS}$ , DQSL,  $\overline{DQSL}$ , DQSU,  $\overline{DQSU}$  need to be within the respective limits (VIH (dc) max, VIL (dc) min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specifications" on page 29.

## Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK,  $\overline{\text{CK}}$  and DQS,  $\overline{\text{DQS}}$ ) must meet the requirements in the table below. The differential input cross point voltage  $V_{IX}$  is measured from the actual cross point of true and complement signals to the midlevel between of VDD and VSS

Vix Definition

### Cross point voltage for differential input signals (CK, DQS)

Symbol	Parameter	DDR3L-800, 1066, 1333		Unit	Notes
		Min	Max		
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK, $\overline{\text{CK}}$	-150	150	mV	
		-175	175	mV	1
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{\text{DQS}}$	-150	150	mV	

#### Notes:

- Extended range for  $V_{IX}$  is only allowed for clock and if single-ended clock input signals CK and  $\overline{\text{CK}}$  are monotonic with a single-ended swing  $V_{SEL} / V_{SEH}$  of at least  $V_{DD}/2 \pm 250$  mV, and when the differential slew rate of  $\text{CK} - \overline{\text{CK}}$  is larger than 3 V/ns.
- Refer to the table "Single-ended levels for CK, DQS, DQSL, DQSU, CK, DQS, DQSL or DQSU" on page 22 for  $V_{SEL}$  and  $V_{SEH}$  standard values

## Slew Rate Definitions for Single-Ended Input Signals

See 7.5 “Address / Command Setup, Hold and Derating” on page 138 in “DDR3L Device Operation” for single-ended slew rate definitions for address and command signals.

See 7.6 “Data Setup, Hold and Slew Rate Derating” on page 145 in “DDR3L Device Operation” for single-ended slew rate definition for data signals.

## Slew Rate Definitions for Differential Input Signals

Input slew rate for differential signals ( $\overline{CK}$ ,  $\overline{CK}$  and  $\overline{DQS}$ ,  $\overline{DQS}$ ) are defined and measured as shown in table and figure below.

### Differential Input Slew Rate Definition

Description	Measured		Defined by
	Min	Max	
Differential input slew rate for rising edge ( $\overline{CK}$ - $\overline{CK}$ and $\overline{DQS}$ - $\overline{DQS}$ )	VILdiffmax	VIHdiffmin	$[VIHdiffmin - VILdiffmax] / \Delta TRdiff$
Differential input slew rate for falling edge ( $\overline{CK}$ - $\overline{CK}$ and $\overline{DQS}$ - $\overline{DQS}$ )	VIHdiffmin	VILdiffmax	$[VIHdiffmin - VILdiffmax] / \Delta TFdiff$

#### Notes:

The differential signal (i.e.  $\overline{CK}$ - $\overline{CK}$  and  $\overline{DQS}$ - $\overline{DQS}$ ) must be linear between these thresholds.

Differential Input Slew Rate Definition for  $\overline{DQS}$ ,  $\overline{DQS}$  and  $\overline{CK}$ ,  $\overline{CK}$

### Differential Input Slew Rate Definition for $\overline{DQS}$ , $\overline{DQS}$ and $\overline{CK}$ , $\overline{CK}$

## AC & DC Output Measurement Levels

### Single Ended AC and DC Output Levels

Table below shows the output levels used for measurements of single ended signals.

#### Single-ended AC and DC Output Levels

Symbol	Parameter	DDR3L-800, 1066,	Unit	Notes
		1333		
$V_{OH(DC)}$	DC output high measurement level (for IV curve linearity)	$0.8 \times V_{DDQ}$	V	
$V_{OM(DC)}$	DC output mid measurement level (for IV curve linearity)	$0.5 \times V_{DDQ}$	V	
$V_{OL(DC)}$	DC output low measurement level (for IV curve linearity)	$0.2 \times V_{DDQ}$	V	
$V_{OH(AC)}$	AC output high measurement level (for output SR)	$V_{TT} + 0.1 \times V_{DDQ}$	V	1
$V_{OL(AC)}$	AC output low measurement level (for output SR)	$V_{TT} - 0.1 \times V_{DDQ}$	V	1

#### Notes:

1. The swing of  $\pm 0.1 \times V_{DDQ}$  is based on approximately 50% of the static single ended output high or low swing with a driver impedance of  $40\Omega$  and an effective test load of  $25\Omega$  to  $V_{TT} = V_{DDQ} / 2$ .

### Differential AC and DC Output Levels

Table below shows the output levels used for measurements of single ended signals.

#### Differential AC and DC Output Levels

Symbol	Parameter	DDR3L-800, 1066,	Unit	Notes
		1333		
$V_{OHdiff(AC)}$	AC differential output high measurement level (for output SR)	$+ 0.2 \times V_{DDQ}$	V	1
$V_{OLdiff(AC)}$	AC differential output low measurement level (for output SR)	$- 0.2 \times V_{DDQ}$	V	1

#### Notes:

1. The swing of  $\pm 0.2 \times V_{DDQ}$  is based on approximately 50% of the static differential output high or low swing with a driver impedance of  $40\Omega$  and an effective test load of  $25\Omega$  to  $V_{TT} = V_{DDQ}/2$  at each of the differential outputs.

## Single Ended Output Slew Rate

When the Reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between  $V_{OL(AC)}$  and  $V_{OH(AC)}$  for single ended signals are shown in table and figure below.

### Single-ended Output slew Rate Definition

Description	Measured		Defined by
	From	To	
Single-ended output slew rate for rising edge	$V_{OL(AC)}$	$V_{OH(AC)}$	$[V_{OH(AC)} - V_{OL(AC)}] / \Delta TR_{se}$
Single-ended output slew rate for falling edge	$V_{OH(AC)}$	$V_{OL(AC)}$	$[V_{OH(AC)} - V_{OL(AC)}] / \Delta TF_{se}$

#### Notes:

- Output slew rate is verified by design and characterisation, and may not be subject to production test.

Single Ended Output Slew Rate Definition

### Single Ended Output slew Rate Definition Output Slew Rate (single-ended)

		DDR3-800		DDR3-1066		DDR3-1333		Units
Parameter	Symbol	Min	Max	Min	Max	Min	Max	
Single-ended Output Slew Rate	SRQse	1.75	5 <sup>1)</sup>	1.75	5 <sup>1)</sup>	1.75	5 <sup>1)</sup>	V/ns

Description: SR; Slew Rate

Q: Query Output (like in DQ, which stands for Data-in, Query-Output) se: Single-ended Signals

For Ron = RZQ/7 setting

Note 1): In two cases, a maximum slew rate of 6 V/ns applies for a single DQ signal within a byte lane. Case\_1 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane are static (i.e. they stay at either high or low).

Case\_2 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane are switching into the opposite direction (i.e. from low to high or high to low respectively). For the remaining DQ signal switching into the opposite direction, the regular maximum limit of 5 V/ns applies.

## Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between VOLdiff (AC) and VOHdiff (AC) for differential signals as shown in table and figure below.

### Differential Output Slew Rate Definition

Description	Measured		Defined by
	From	To	
Differential output slew rate for rising edge	V <sub>OLdiff</sub> (AC)	V <sub>OHdiff</sub> (AC)	$[V_{OHdiff} (AC) - V_{OLdiff} (AC)] / \Delta T_{Rdiff}$
Differential output slew rate for falling edge	V <sub>OHdiff</sub> (AC)	V <sub>OLdiff</sub> (AC)	$[V_{OHdiff} (AC) - V_{OLdiff} (AC)] / \Delta T_{Fdiff}$

#### Notes:

- Output slew rate is verified by design and characterization, and may not be subject to production test.

Differential Output Slew Rate Definition

### Differential Output slew Rate Definition

### Differential Output Slew Rate

Parameter	Symbol	DDR3L-800		DDR3L-1066		DDR3L-1333		Units
		Min	Max	Min	Max	Min	Max

Description: SR; Slew Rate

Q: Query Output (like in DQ, which stands for Data-in, Query-Output)

se: Single-ended Signals

For Ron = RZQ/7 setting

## Reference Load for AC Timing and Output Slew Rate

Figure below represents the effective reference load of 25 ohms used in defining the relevant AC timing parameters of the device as well as output slew rate measurements.

It is not intended as a precise representation of any particular system environment or a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

Reference Load for AC Timing and Output Slew Rate

## Overshoot and Undershoot Specifications

### Address and Control Overshoot and Undershoot Specifications

## Speed Bin Table Notes

Absolute Specification ( $T_{OPER}$ ;  $V_{DDQ} = V_{DD} = 1.5V \pm 0.075V$ );

Notes:

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK (AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK (AVG) value (2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK (AVG) [ns], rounding up to the next 'Supported CL'.
3. tCK(AVG).MAX limits: Calculate tCK (AVG) = tAA.MAX / CLSELECTED and round the resulting tCK (AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CLSELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
6. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. Hynix DDR3 SDRAM devices support down binning to CL=7 and CL=9, and tAA/tRCD/tRP satisfy minimum value of 13.125ns. SPD settings are also programmed to match. For example, DDR3 1333H devices supporting down binning to DDR3-1066F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600K devices supporting down binning to DDR3-1333H or DDR3 1600F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin = 36 ns + 13.125 ns) for DDR3-1333H and 48.125ns (tRASmin + tRPmin = 35 ns + 13.125 ns) for DDR3-1600K.

## Environmental Parameters

Symbol	Parameter	Rating	Units	Notes
T <sub>OPR</sub>	Operating temperature (ambient)	0 to +55	°C	3
H <sub>OPR</sub>	Operating humidity (relative)	10 to 90	%	
T <sub>STG</sub>	Storage temperature	-50 to +100	°C	1
H <sub>STG</sub>	Storage humidity (without condensation)	5 to 95	%	1
P <sub>BAR</sub>	Barometric Pressure (operating & storage)	105 to 69	K Pascal	1, 2

**Note:**

1. Stress greater than those listed may cause permanent damage to the device. This is a stress rating only, and device functional operation at or above the conditions indicated is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Up to 9850 ft.
3. The designer must meet the case temperature specifications for individual module components.

## Pin Capacitance (VDD=1.35V, VDDQ=1.35V)

### 2GB: HMT325U7AFR8A

DQ, DM, DQS, $\overline{\text{DQS}}$	C <sub>IO</sub>	TBD	TBD	pF

#### Note:

1. Pins not under test are tied to GND.
2. These value are guaranteed by design and tested on a sample basis only.

## IDD and IDDQ Specification Parameters and Test Conditions

### IDD and IDDQ Measurement Conditions

In this chapter, IDD and IDDQ measurement conditions such as test load and patterns are defined. Figure below (Measurement Setup and Test Load for IDD and IDDQ (optional) Measurements) shows the setup and test load for IDD and IDDQ measurements.

- IDD currents (such as IDD0, IDD1, IDD2N, IDD2NT, IDD2P0, IDD2P1, IDD2Q, IDD3N, IDD3P, IDD4R, IDD4W, IDD5B, IDD6, IDD6ET, IDD6TC and IDD7) are measured as time-averaged currents with all VDD balls of the DDR3 SDRAM under test tied together. Any IDDQ current is not included in IDD currents.
- IDDQ currents (such as IDDQ2NT and IDDQ4R) are measured as time-averaged currents with all VDDQ balls of the DDR3 SDRAM under test tied together. Any IDD current is not included in IDDQ currents.

Attention: IDDQ values cannot be directly used to calculate IO power of the DDR3 SDRAM. They can be used to support correlation of simulated IO power to actual IO power as outlined in the Figure below (Correlation from simulated Channel IO Power to actual Channel IO Power supported by IDDQ Measurement). In DRAM module application, IDDQ cannot be measured separately since VDD and VDDQ are using on merged-power layer in Module PCB.

For IDD and IDDQ measurements, the following definitions apply:

- "0" and "LOW" is defined as  $V_{IN} \leq V_{ILAC(max)}$ .
- "1" and "HIGH" is defined as  $V_{IN} \geq V_{IHAC(max)}$ .
- "MID\_LEVEL" is defined as inputs are  $V_{REF} = V_{DD}/2$ .
- Timing used for IDD and IDDQ Measurement-Loop Patterns are provided in Table 1.
- Basic IDD and IDDQ Measurement Conditions are described in Table 2.
- Detailed IDD and IDDQ Measurement-Loop Patterns are described in Table 3 through Table 10.
- IDD Measurements are done after properly initializing the DDR3 SDRAM. This includes but is not limited to setting
  - RON = RZQ/7 (34 Ohm in MR1);
  - Qoff = 0<sub>B</sub> (Output Buffer enabled in MR1);
  - RTT\_Nom = RZQ/6 (40 Ohm in MR1);
  - RTT\_Wr = RZQ/2 (120 Ohm in MR2);
  - TDQS Feature disabled in MR1
- Attention: The IDD and IDDQ Measurement-Loop Patterns need to be executed at least one time before actual IDD or IDDQ measurement is started.
- Define  $\overline{D} = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} = \{HIGH, LOW, LOW, LOW\}$   
 Define  $\overline{D} = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} = \{HIGH, HIGH, HIGH, HIGH\}$

Symbol	Description
$I_{DD0}$	<p>Operating One Bank Active-Precharge Current</p> <p>CKE: High; External clock: On; tCK, nRC, nRAS, CL: see Table 1; BL: 8<sup>a</sup>); AL: 0; <math>\overline{CS}</math>: High between ACT and PRE; Command, Address, Bank Address Inputs: partially toggling according to Table 3; Data IO: MID-LEVEL; DM: stable at 0; Bank Activity: Cycling with one bank active at a time: 0,0,1,1,2,2,... (see Table 3); Output Buffer and RTT: Enabled in Mode Registers<sup>b</sup>); ODT Signal: stable at 0; Pattern Details: see Table 3.</p>
$I_{DD1}$	<p>Operating One Bank Active-Precharge Current</p> <p>CKE: High; External clock: On; tCK, nRC, nRAS, nRCD, CL: see Table 1; BL: 8<sup>a</sup>); AL: 0; <math>\overline{CS}</math>: High between ACT, RD and PRE; Command, Address; Bank Address Inputs, Data IO: partially toggling according to Table 4; DM: stable at 0; Bank Activity: Cycling with on bank active at a time: 0,0,1,1,2,2,... (see Table 4); Output Buffer and RTT: Enabled in Mode Registers<sup>b</sup>); ODT Signal: stable at 0; Pattern Details: see Table 4.</p>

Symbol	Description
$I_{DD2N}$	Precharge Standby Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: partially toggling according to Table 5; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks closed; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Pattern Details: see Table 5.
$I_{DD2NT}$	Precharge Standby ODT Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: partially toggling according to Table 6; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks closed; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: toggling according to Table 6; Pattern Details: see Table 6.
$I_{DDQ2NT}$ (optional)	Precharge Standby ODT IDDQ Current Same definition like for IDD2NT, however measuring IDDQ current instead of IDD current
$I_{DD2PO}$	Precharge Power-Down Current Slow Exit CKE: Low; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: stable at 0; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks closed; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Precharge Power Down Mode: Slow Exit <sup>c)</sup>
$I_{DD2P1}$	Precharge Power-Down Current Fast Exit CKE: Low; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: stable at 0; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks closed; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Precharge Power Down Mode: Fast Exit <sup>c)</sup>
$I_{DD2Q}$	Precharge Quiet Standby Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: stable at 0; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks closed; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0
$I_{DD3N}$	Active Standby Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: partially toggling according to Table 5; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks open; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Pattern Details: see Table 5.

Symbol	Description
$I_{DD3P}$	Active Power-Down Current CKE: Low; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : stable at 1; Command, Address, Bank Address Inputs: stable at 0; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: all banks open; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0
$I_{DDQ4R}$ (optional)	Operating Burst Read IDDQ Current Same definition like for IDD4R, however measuring IDDQ current instead of IDD current
$I_{DD4R}$	Operating Burst Read Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : High between RD; Command, Address, Bank Address Inputs: partially toggling according to Table 7; Data IO: seamless read data burst with different data between one burst and the next one according to Table 7; DM: stable at 0; Bank Activity: all banks open, RD commands cycling through banks: 0,0,1,1,2,2,...(see Table 7); Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Pattern Details: see Table 7.
$I_{DD4W}$	Operating Burst Write Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : High between WR; Command, Address, Bank Address Inputs: partially toggling according to Table 8; Data IO: seamless read data burst with different data between one burst and the next one according to Table 8; DM: stable at 0; Bank Activity: all banks open, WR commands cycling through banks: 0,0,1,1,2,2,...(see Table 8); Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at HIGH; Pattern Details: see Table 8.
$I_{DD5B}$	Burst Refresh Current CKE: High; External clock: On; tCK, CL, nRFC: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ : High between REF; Command, Address, Bank Address Inputs: partially toggling according to Table 9; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: REF command every nREF (see Table 9); Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Pattern Details: see Table 9.
$I_{DD6}$	Self-Refresh Current: Normal Temperature Range $T_{CASE}$ : 0 - 85 °C; Auto Self-Refresh (ASR): Disabled <sup>d)</sup> ; Self-Refresh Temperature Range (SRT): Normal <sup>e)</sup> ; CKE: Low; External clock: Off; CK and $\overline{CK}$ : LOW; CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ , Command, Address, Bank Address Inputs, Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: MID_LEVEL

Symbol	Description
$I_{DD6ET}$	Self-Refresh Current: Extended Temperature Range $T_{CASE}$ : 0 - 95 °C; Auto Self-Refresh (ASR): Disabled <sup>d)</sup> ; Self-Refresh Temperature Range (SRT): Extended <sup>e)</sup> ; CKE: Low; External clock: Off; CK and $\overline{CK}$ : LOW; CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ , Command, Address, Bank Address Inputs, Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: Extended Temperature Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: MID_LEVEL
$I_{DD6TC}$	Auto Self-Refresh Current $T_{CASE}$ : 0 - 95 °C; Auto Self-Refresh (ASR): Enabled <sup>d)</sup> ; Self-Refresh Temperature Range (SRT): Normal <sup>e)</sup> ; CKE: Low; External clock: Off; CK and $\overline{CK}$ : LOW; CL: see Table 1; BL: 8 <sup>a)</sup> ; AL: 0; $\overline{CS}$ , Command, Address, Bank Address Inputs, Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: Auto Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: MID_LEVEL
$I_{DD7}$	Operating Bank Interleave Read Current CKE: High; External clock: On; tCK, nRC, nRAS, nRCD, NRRD, nFAW, CL: see Table 1; BL: 8 <sup>a),f)</sup> ; AL: CL-1; $\overline{CS}$ : High between ACT and RDA; Command, Address, Bank Address Inputs: partially toggling according to Table 10; Data IO: read data burst with different data between one burst and the next one according to Table 10; DM: stable at 0; Bank Activity: two times interleaved cycling through banks (0, 1,...7) with different addressing, see Table 10; Output Buffer and RTT: Enabled in Mode Registers <sup>b)</sup> ; ODT Signal: stable at 0; Pattern Details: see Table 10.

a) Burst Length: BL8 fixed by MRS: set MR0 A[1,0]=00B

b) Output Buffer Enable: set MR1 A[12] = 0B; set MR1 A[5,1] = 01B; RTT\_Nom enable: set MR1 A[9,6,2] = 011B; RTT\_Wr enable: set MR2 A[10,9] = 10B

c) Precharge Power Down Mode: set MR0 A12=0B for Slow Exit or MR0 A12 = 1B for Fast Exit

d) Auto Self-Refresh (ASR): set MR2 A6 = 0B to disable or 1B to enable feature

e) Self-Refresh Temperature Range (SRT): set MR2 A7 = 0B for normal or 1B for extended temperature range

f) Read Burst Type: Nibble Sequential, set MR0 A[3] = 0B

		Assert and repeat above D Command until 4* nFAW - 1, if necessary																	

a) DM must be driven LOW all the time. DQS,  $\overline{DQS}$  are used according to RD Commands, otherwise MID-LEVEL.

b) Burst Sequence driven on each DQ signal by Read Command. Outside burst operation, DQ signals are MID-LEVEL.

## IDD Specifications (Tcase: 0 to 95°C)

\* Module IDD values in the datasheet are only a calculation based on the component IDD spec.  
The actual measurements may vary according to DQ loading cap.
