■ PAGE PROGRAMMING FLOWCHART

The Hitachi HN27C4096H can be programmed with the high performance Page Programming algorithm shown in the following flowchart. This algorithm provides a fast programming time without voltage stress to the device or deterioration in reliability of programmed data.

- Note:
1. To set the device into Page Programming, apply 12.5 V to V_{PP} then followed by applying 12 V to OE. The device operates in Page Program Mode until reset.
 2. To reset the Page Program Mode, set $V_{PP} = V_{CC}$ or less.

■ OPTIONAL PAGE PROGRAMMING FLOWCHART

The Hitachi HN27C4096H can be programmed with the high performance Optional Page Programming algorithm shown in the following flowchart. This algorithm provides a fast programming time without voltage stress to the device or deterioration in reliability of programmed data.

This programming algorithm is a combination of Page Programming and Word Verify. It can be used to avoid the increased programming verify time when a programmer with a slower machine cycle is used and shorten the total programming time.

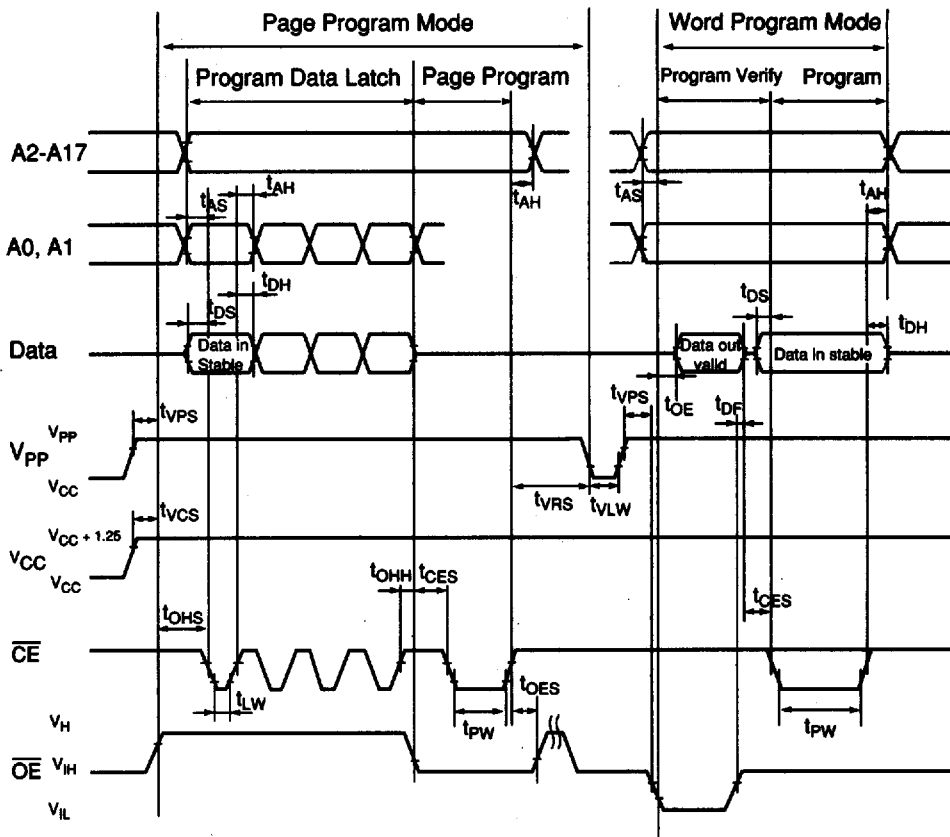

Please refer to the timing specifications for page programming and word programming.

■ **ERASING THE HN27C4096H**

The Hitachi HN27C4096H is erased by exposure to ultraviolet light of 2537Å. All of the data is changed to "1" after this erasure procedure. The minimum integrated dose (UV intensity x exposure time) for erasure is 15 W-sec/cm².

■ **DEVICE IDENTIFIER MODE DESCRIPTION**

The Device Identifier Mode allows binary codes to be read from the outputs that identify the manufacturer and the type of device. Using this mode with programming equipment, the device will automatically match its own erase and programming algorithm.
