### 6.2 Back-Light Unit

The back-light system is an edge-lighting type with 4 CCFL(Cold Cathode Fluorescent Lamp).  
The characteristics of the lamp are shown in the following tables.

Item	Symbol	Min.	Typ.	Max.	Unit	Note
Lamp current	IL	3.0	7.5	8.0	mA(rms)	(1)
Lamp voltage	VL	603	670	737	V(rms)	$I_L=7.5mA$
Frequency	fL	40	50	80	KHz	(2)
Operating Lifetime	Hr	50,000	--	--	Hour	6.5mA(3)
	Hr	40,000	--	50,000	Hour	7.5mA(3)
Startup voltage	Vs	1450	--	--	V(rms)	at 25°C
		1700				at 0°C

**Note (1)**

Lamp current is measured with current meter for high frequency as shown below. Specified values are for a single lamp. To exceed 8.5.0mA, life time accelerate drop down and if to exceed 9.0 mA has safety problem. If current lower than 3.5 mA, CCFL would be unstable or damaged.

**Note (2)**

Lamp frequency may produce interference with horizontal synchronous frequency and this may cause ripple noise on the display. Therefore lamp frequency shall be kept away from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

**Note (3)**

Lamp life time (Hr) can be defined as the time in which it continues to operate under the condition :  $T_a=25\pm 3^\circ C$ , Typical IL value indicated in the above table and  $f_L=48$  kHz until the brightness becomes less than 50%

Document Title	<b>HSD190ME13- A</b> Product Information	Page No.	18 / 27
Document No.		Revision	1.0

Note (4)

CCFL inverter should be able to provide a voltage over specified value (Vs) in the above table. Lamp units need at least Vs value shown above to ignition.

Note (5)

The voltage over specified value (Vs) should be applied to the lamp more than 1 second after startup. Otherwise, the lamp may not be turned on. The used lamp current is the lamp typical current.

Note (6)

The output voltage waveform and current waveform of the inverter must be symmetrical (Unsymmetrical ratio is less than 10%). Please do not use the inverter which has unsymmetrical voltage and current waveform, and spike waveform. The inverter design which can provide the best optical performance, power efficiency, and lamp life should under the following conditions.

- a. The asymmetry rate of the inverter waveform should be less than 10%.
- b. The distortion rate of the waveform should be within  $\sqrt{2} \pm 10\%$ .
- c. The inverter output waveform should be better similar to the ideal sine wave.

$$\text{Asymmetry rate} = |I_p - I_{-p}| / I_{rms} \times 100\%$$

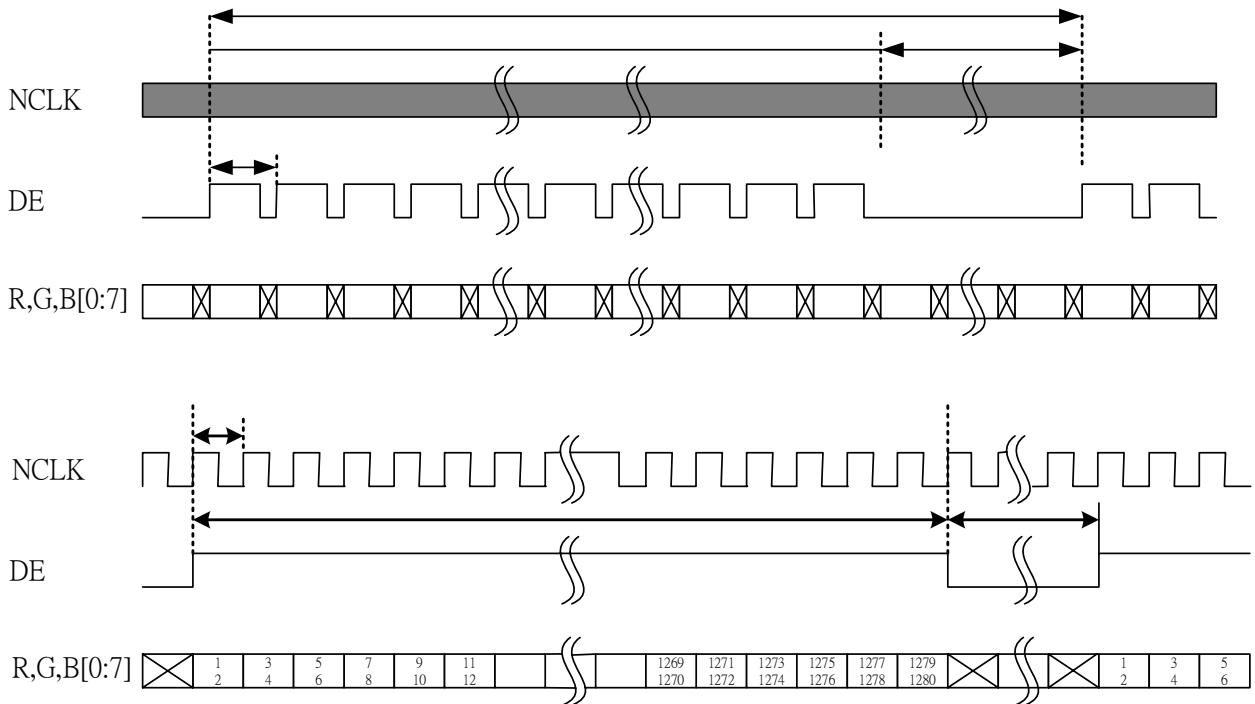

$$\text{Distortion rate} = I_p \text{ (or } I_{-p}) / I_{rms}$$

TP3	0	--	50	msec	
TP4	500	--	--	msec	
TP5	200	--	--	msec	
TP6	200	--	--	msec	

- Note : (1) The supply voltage of the external system for the module input should be the same as the definition of V<sub>DD</sub>.
- (2) Apply the lamp volatge within the LCD operation range. When the back-light turns on before the LCD operation or the LCD truns off before the back-light turns off, the display may momentarily become white.
- (3) In case of VDD = off level, please keep the level of input signal on the low or keep a high impedance.
- (4) TP4 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.
