Note (3) Input Rush Current condition

The duration of inrush current is about 0.5ms and rising time of power input is 1 ms (min)

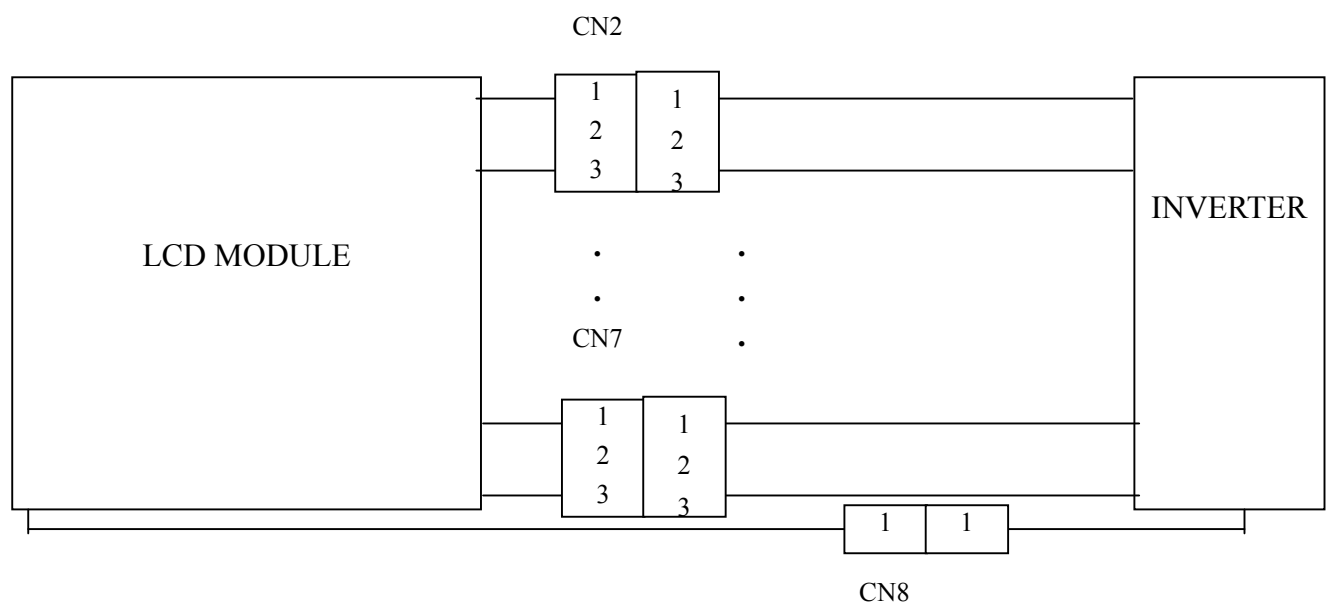

6.2 Back-Light Unit

The back-light system is 12 CCFL(Cold Cathode Fluorescent Lamp).

The characteristics of the lamp are shown in the following tables.

Note (1) Lamp current is measured with current meter for high frequency as shown below. Specified valued are for a lamp.

Note (2) Lamp frequency may produce interference with horizontal synchronous frequency and this may cause ripple noise on the display. Therefore lamp frequency shall be kept away from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

Note (3) Lamp life time (Hr) can be defined as the time in which it continues to operate under the condition : $T_a=25\pm3^{\circ}\text{C}$, Typical IL value indicated in the above table and $f_L=56\text{kHz}$ 6mA until the brightness becomes less than 50%.

Note (4) CCFL inverter should be able to provide a voltage over specified value (Vs) in the above table. Lamp units need at least Vs value shown above to ignition.

Note (5) The voltage over specified value (Vs) should be applied to the lamp more than 1 second after startup. Otherwise, the lamp may not be turned on. The used lamp current is the lamp typical current.

Note (6) The output voltage waveform and current waveform of the inverter must be symmetrical (Unsymmetrical ratio is less than 10%). Please do not use the inverter which has unsymmetrical voltage and current waveform, and spike waveform. The inverter design which can provide the best optical performance, power efficiency, and lamp life should under the following conditions.

- The asymmetry rate of the inverter waveform should be less than 10%.
- The distortion tae of the waveform should be within $\sqrt{2}\pm 10\%$.
- The inverter output waveform should be better similar to the ideal sine wave.

$$\text{Asymmetry rate} = |I_p - I-p| / I_{\text{rms}} \times 100\%$$

$$\text{Distortion rate} = I_p \text{ (or } I-p) / I_{\text{rms}}$$

Note 1) Refer to TIMING CHART at page20, 21 and LVDS specification (DS90C385) by National Semiconductor Corporation.

Note 2) When ENAB is fixed to “H” level or “L” level after NCLK is supplied, the panel displays black with some flicker.

Note 3) If NCLK is fixed to “H” level or “L” level, for certain period while ENAB is supplied, the panel may be damaged.

Note 4) Do not make t1 and t3's fluctuate. If t1 or t3 is fluctuating, the panel displays black.

Note 5) Please adjust LCD operating signal timing and FL driving frequency, to optimize the display quality. There is a possibility that flicker is observed by the interference of LCD operating signal timing and FL driving condition (especially driving frequency).

- (3) In case of VDD = off level, please keep the level of input signal on the low or keep a high impedance.
- (4) T4 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.
