

Operational Amplifier, Rail-to-Rail Output, 3 MHz BW

The HT2007x series operational amplifiers provide rail-to-rail output operation, 3 MHz bandwidth, and are available in single, dual, and quad configurations. Rail-to-rail operation enables the user to make optimal use of the entire supply voltage range while taking advantage of 3 MHz bandwidth. The HT2007x can operate on supply voltages as low as 2.7 V over the temperature range of -40°C to 125°C . At a 2.7 V supply, the high bandwidth provides a slew rate of $2.8\text{ V}/\mu\text{s}$ while only consuming $405\ \mu\text{A}$ of quiescent current per channel. The wide supply range allows the HT2007x to run on supply voltages as high as 36 V, making it ideal for a broad range of applications. Since this is a CMOS device, high input impedance and low bias currents make it ideal for interfacing to a wide variety of signal sensors. The HT2007x devices are available in a variety of compact packages. Automotive qualified options are available under the NCV prefix.

Features

- Rail-To-Rail Output
- Wide Supply Range: 2.7 V to 36 V
- Wide Bandwidth: 3 MHz typical at $V_S = 2.7\text{ V}$
- High Slew Rate: $2.8\text{ V}/\mu\text{s}$ typical at $V_S = 2.7\text{ V}$
- Low Supply Current: $405\ \mu\text{A}$ per channel at $V_S = 2.7\text{ V}$
- Low Input Bias Current: 5 pA typical
- Wide Temperature Range: -40°C to 125°C
- Available in a variety of packages
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Current Sensing
- Signal Conditioning
- Automotive

End Products

- Notebook Computers
- Portable Instruments
- Power Supplies

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
- Maximum input current must be limited to ± 10 mA. Series connected resistors of at least 500 Ω on both inputs may be used to limit the maximum input current to ± 10 mA.
- Total power dissipation must be limited to prevent the junction temperature from exceeding the 150°C limit.
- Continuous short circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of the maximum output current rating over the long term may adversely affect reliability. Shorting output to either VDD or VSS will adversely affect reliability.
- This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per JEDEC standard JS-001 (AEC-Q100-002)
 ESD Machine Model tested per JEDEC standard JESD22-A115 (AEC-Q100-003)
 ESD Charged Device Model tested per JEDEC standard JESD22-C101 (AEC-Q100-011)
- Latch-up Current tested per JEDEC standard JESD78 (AEC-Q100-004)
- Moisture Sensitivity Level tested per IPC/JEDEC standard J-STD-020A

APPLICATIONS INFORMATION
Input Circuit

The HTS2007x input stage has a PMOS input pair and ESD protection diodes. The input pair is internally connected by back-to-back Zener diodes with a reverse voltage of 5.5 V. To protect the internal circuitry, the input current must be limited to 10 mA. When operating the

HTS2007x at differential voltages greater than $V_{ID} = 26$ V, series resistors can be added externally to limit the input current flowing between the input pins. Adding $500\ \Omega$ resistors in series with the input prevents the current from exceeding 10 mA over the entire operating range up to 36 V.

Figure 29. Differential Input Pair

Output

The HTS2007x has a class AB output stage with rail-to-rail output swing.

High output currents can cause the junction temperature to exceed the 150°C absolute maximum rating. In the case of a short circuit where the output is connected to either supply rail, the amount of current the op amp can source and sink is described by the output current capability parameter

listed in the Electrical Characteristics. The junction temperature at a given power dissipation, P , can be calculated using the following formula:

$$T_J = T_A + P \times \theta_{JA}$$

The thermal resistance between junction and ambient, θ_{JA} , is provided in the Thermal Information section of this datasheet.
