### General Description

The HT72XX series of positive, linear regulators features low quiescent current (4 $\mu$ A typ.) with low dropout voltage, making them ideal for battery applications. The space-saving SOT23 package is attractive for "Pocket" and "Hand Held" applications. The devices are capable of supplying 300mA of output current continuously.

They are available with several fixed output voltages ranging from 1.8V to 5.0V. Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain variable voltages and currents.

These rugged devices have Thermal Shutdown and Current Limiting to prevent device failure under the "Worst" of operating conditions.

### Selection Table

Part No.	Output Voltage	Tolerance	Package	Marking
HT7218	1.8V	$\pm 2\%$	SOT23 SOT23-5 SOT89 TO92	72XX# (for SOT23) 72XX# (for SOT23-5) HT72XX# (for SOT89) HT72XX (for TO92)
HT7225	2.5V			
HT7227	2.7V			
HT7230	3.0V			
HT7233	3.3V

Note: "XX" stands for output voltages.

For lead free devices, TO92 package will add a "#" mark at the end of the date code, whereas SOT89 & SOT23, SOT23-5 packages will add a "#" mark at the end of the marking.

**Absolute Maximum Ratings\***

Maximum Supply Voltage ..... up to 8.5V      Storage Temperature ..... -50°C to 125°C  
 Operating Temperature ..... -40°C to 85°C

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

"\*" Absolute maximum ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. The guaranteed specifications apply only for the test conditions listed.

- Note:
1. Load regulation is measured at a constant junction temperature, using pulse testing with a low ON time and is guaranteed up to the maximum power dissipation. Power dissipation is determined by the input/output differential voltage and the output current. Guaranteed maximum power dissipation will not be available over the full input/output range. The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_a) / \theta_{JA}$ .
  2. Dropout voltage is defined as the input voltage minus the output voltage that produces a 2% change in the output voltage from the value at  $V_{IN} = V_{OUT} + 1\text{V}$  with a fixed load.
  3. Current limit is measured by pulsing for a short time.
