

Features**Patent Number: 64097, 86474, 113235(R.O.C.), 5424740(U.S.A.)**

- Universal specification
- Operating voltage: 2.0V~5.5V
- Low standby current
- Low memory retention current: 0.1 μ A (Typ.)
- Tone/pulse switchable
- Interface with LCD driver
- 32 digits for redialing
- 32 digits for the SA memory dialing
- One-key redialing
- Pause and P→T key for PBX
- 4×5 keyboard matrix
- 3.58MHz crystal or ceramic resonator
- Hand-free control
- Hold-line control
- Pause, P→T can be saved for redialing
- Lock function
- Keytone function
- Resistor options:
 - M/B ratio
 - Flash function and flash time(86ms~600ms)
 - Pause and P→T duration
 - Pulse number
 - Keyboard operated IDD lock function
 - Key board form

General Description

The HT9305/6 series tone/pulse dialers are CMOS LSIs for telecommunication systems. They are designed to meet various dialing specifications through resistor option matrix.

The HT9305/6 series tone/pulse dialers are offered in four different versions. They are HT9305x/HT9306x normal version; HT9305xL/HT9305xI

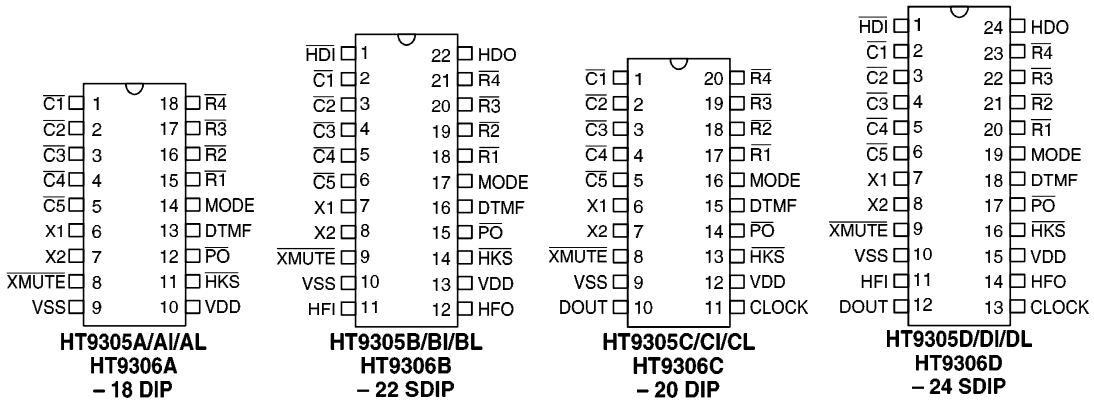

lock version, with keyboard-operated IDD lock function; HT9305xT keytone version; and HT9305xLT/HT9305xIT keytone/lock function version. The four versions also supply the following functions: Hold-line, Hand-free and LCD dialing number display interface, all of which are suitable for feature phone applications.

Selection Table

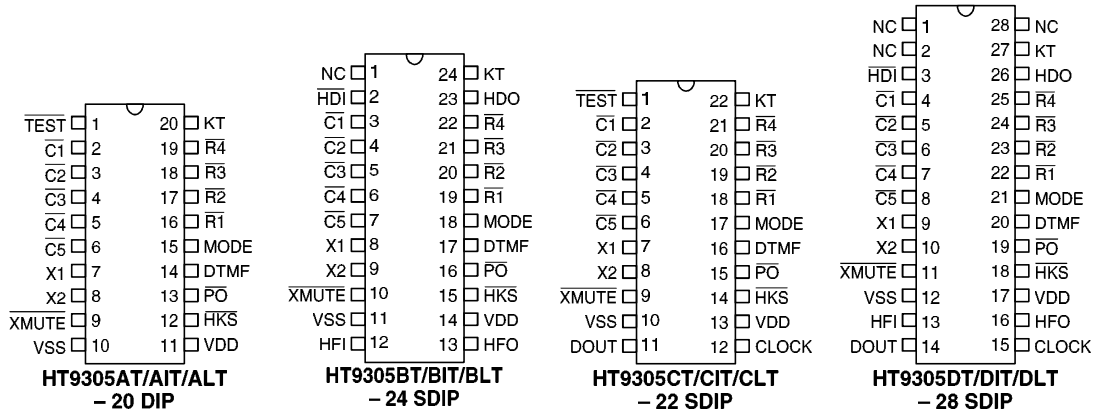

Function Item	Keytone	Lock Function	Hold-Line	Hand-Free	LCD Interface	Min. Flash Time	Package
HT9305x	(Normal version)						
HT9305A	—	—	—	—	—	98 ms	18 DIP

Block Diagram

Pin Description

Pin Name	I/O	Internal Connection	Description
$\overline{C1-C5}$ $\overline{R1-R4}$	I/O	CMOS IN/OUT	These pins form a 4×5 keyboard matrix which can perform keyboard input detection and dialing specification setting functions. When on-hook (\overline{HKS} =high) all the pins are set high. While off-hook the column group ($\overline{C1-C5}$) remains low and the row group ($\overline{R1-R4}$) is set high for key input detection. An inexpensive single contact 4×5 keyboard can be used as an input device. Pressing a key connects a single column to a single row, and actuates the system oscillator that results in a dialing signal output. If more than two keys are pressed at the same time, no response occurs. The key-in debounce time is 20ms. Refer to the keyboard information for keyboard arrangement and to the functional description for dialing specification selection.
X1	I	OSCILLATOR	The system oscillator consists of an inverter, a bias resistor and the necessary load capacitor on chip. Connecting a standard 3.579545MHz crystal or ceramic resonator to the X1 and X2 terminals can implement the oscillator function. The oscillator is turned off in the standby mode, and is actuated whenever a keyboard entry is detected.
X2	O		
\overline{XMUTE}	O	NMOS OUT	\overline{XMUTE} is an NMOS open drain structure pulled to VSS during dialing signal transmission. Otherwise, it is an open circuit. \overline{XMUTE} is used to mute the speech circuit when transmitting the dial signal.
\overline{HKS}	I	CMOS IN	This pin is used to monitor the status of the hook-switch and its combination with $\overline{HFI/HDI}$ can control the \overline{PO} pin output to make or break the line. \overline{HKS} =VDD: On-hook state (\overline{PO} =low). Except for $\overline{HFI/HDI}$ (hand-free/hold-line control input), other functions are all disabled. \overline{HKS} =VSS: Off-hook state (\overline{PO} =high). The chip is in the standby mode and ready to receive the key input.
\overline{TEST}	I	CMOS IN	This is a test pin. It should be connected to VDD when in normal operation.
\overline{PO}	O	CMOS OUT	This pin is a CMOS output structure, which by receiving the \overline{HKS} and $\overline{HFO/HDO}$ signals, control the dialer to connect or disconnect the telephone line. \overline{PO} outputs a low to break line when \overline{HKS} is high (on-hook) and $\overline{HFO/HDO}$ is low. \overline{PO} outputs a high to make line when \overline{HKS} is low (off-hook) or \overline{HFO} is high or \overline{HDO} is high. During the off-hook state, this pin also outputs the dialing pulse train in pulse mode dialing. While in the tone mode, this pin is always high.

Pin Name	I/O	Internal Connection	Description
MODE	I/O	CMOS IN/OUT	This is a three-state input/output pin, used for dialing mode selection, either Tone mode or Pulse mode, 10pps/20pps MODE=VDD: Pulse mode, 10pps MODE=OPEN: Pulse mode, 20pps MODE=VSS: Tone mode During pulse mode dialing, switching this pin to the tone mode changes the subsequent digit entry to tone mode. When the chips are in tone mode, switching to pulse mode will also be recognized.
DTMF	O	CMOS OUT	This pin is active only when the chip transmits tone dialing signals. Otherwise, it always outputs a low. The pin outputs tone signals to drive the external transmitter amplifier circuit. The load resistor should not be less than 5kΩ.
$\overline{\text{HDI}}$	I	CMOS IN Pull-High	This pin is a schmitt trigger input structure. Active low. Applying a negative going pulse to this pin can toggle the HDO output once. An external RC network is recommended for input debouncing. The pull-high resistance is 200kΩ typ.
HDO	O	CMOS OUT	The HDO is a CMOS output structure. Its output is toggle-controlled by a negative transition on $\overline{\text{HDI}}$. When HDO is toggled high, $\overline{\text{PO}}$ keeps high to hold the line. The hold function can be released by setting $\overline{\text{HFO}}$ high or by an on-off hook operation or by another $\overline{\text{HDI}}$ input. The HDO pin can directly drive the HT3810 series melody generator to produce a hold-line background melody. Refer to the functional description for the hold-line function.
KT	O	CMOS OUT	Keytone output pin. It outputs a 1.2kHz tone carrier when any key is pressed in the pulse mode or when the function keys are pressed in the tone mode.
HFI	I	CMOS IN Pull-Low	This pin is a schmitt trigger input structure. Active high. Applying a positive going pulse to HFI can toggle the HFO once and hence control the hand-free function. The pull-low resistance of HFI is 200kΩ typ. An external RC network is recommended for input debouncing.
HFO	O	CMOS OUT	The HFO is a CMOS output structure. Its output is toggle-controlled by a positive transition on HFI pin. When HFO is high, the hand-free function is enabled and $\overline{\text{PO}}$ outputs a high to connect the line. The hand-free function can be released by setting HDO high or by an on-off-hook operation or by another HFI input. Refer to the functional description for the hand-free functional operation.

Pin Name	I/O	Internal Connection	Description
DOUT	O	NMOS OUT	NMOS open drain output pin. It outputs the BCD code of the dialing digits to the LCD driver chip (HT16XX series) or μ C for dialing number display. Refer to the functional description for the detailed timing.
CLOCK	O	NMOS OUT	NMOS open drain output. When dialing, it outputs a series of pulse trains for DOUT data synchronization. DOUT data is valid at the falling edge of the clock.
VDD	I	—	Positive power supply, 2.0V~5.5V for normal operation
VSS	I	—	Negative power supply

Approximate internal connection circuits

Absolute Maximum Ratings*

Supply Voltage	-0.3V to 6V	Input Voltage	$V_{SS}-0.3$ to $V_{DD}+0.3V$
Storage Temperature	-50°C to 125°C	Operating Temperature	-20°C to 75°C

*Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied and exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Functional Description
Keyboard matrix

C₁~C₅ and R₁~R₄ form a keyboard matrix. Together with a standard 4×5 keyboard, the keyboard matrix is used for dialing entries. In addition, the keyboard matrix provides resistor option for different dialing specification selections. The keyboard arrangement for each of the HT9305/6 series are shown in the **Keyboard Information**.

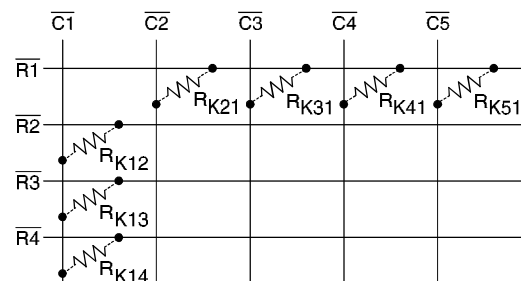

Tone frequency

Tone Name	Output Frequency (Hz)		% Error
	Specified	Actual	
R ₁	697	699	+0.29%
R ₂	770	766	-0.52%
R ₃	852	847	-0.59%
R ₄	941	948	+0.74%
C ₁	1209	1215	+0.50%
C ₂	1336	1332	-0.30%
C ₃	1477	1472	-0.34%

Note: % Error does not contain the crystal frequency drift

Dialing specification selection

Various dialing specifications can be selected by adding resistors across keyboard matrix pins. The allowable option resistor connections are shown below.

All the resistors are 330kΩ. The resistor option functions and the default specifications (without option resistors) are listed below.

Option Resistor	Option Function	Default (No Resistor)
R _{K12}	Make/Break Ratio Selection	40:60
R _{K13}	Flash Function and Flash Time Selection	Flash= control function Flash time= 600ms
R _{K14}		
R _{K21}	Pause & P→T Duration Selection	T _P = 3.6s T _{P→T} = 3.6s
R _{K31}	Pulse Number Selection or IDD Lock Selection	N or Keyboard operated lock

R _{K51}	Keypad Form
No	Form A (see keyboard information)
Yes	Form B (see keyboard information)

Hand-free function operation

- Hand-free function execution
When HFO is low, a rising edge triggers the HFI, enabling the Hand-free function (HFO becomes high).
- Reset Hand-free function
When HFO is high, the Hand-free function is enabled and can be reset by:

- Off-hook
- Applying a rising edge to HFI
- Changing the HDO pin from low to high

Hand-free function table

Current State			Input		Next State		
HKS	HFO	HDO	HDI	HFI	HKS	HFO	HDO
H	L	X	H	L	An	L	An
H	L	X	H	↑	An	H	L
H	H	X	H	↑	An	L	An
H	X	L	H	L	L	L	L
L	L	X	H	L	An	L	An

L	X	X	H	L	H	An	An
X	X	L	↓	L	An	L	H

H: Logic HIGH X: Don't care ↑: Rising edge
L: Logic LOW An: Unchanged ↓: Falling edge

Hold-line function operation

- Hold-line function execution
When HDO is low, a falling edge triggers the HDI, asserting the Hold-line function (HDO becomes high). The $\overline{\text{XMUTE}}$ remains low when HDO is high.
- Reset Hold-line function
When HDO is high, the Hold-line function is enabled and can be reset by:
 - Off-hook
 - Applying a falling edge to $\overline{\text{HDI}}$
 - Changing the HFO pin from low to high

• Hold-line function table

Current State			Input			Next State

DOUT BCD code

When dialing, the corresponding 4-bit BCD codes are serially presented on DOUT from MSB to LSB. The data of DOUT is valid at the falling edge of the CLOCK pin. The following table lists the BCD codes corresponding to the keyboard input.

Key-In	BCD Code	Key-In	BCD Code
1	0001	8	1000
2	0010	9	1001
3	0011	0	1010
4	0100	*/T	1101
5	0101	#	1100
6	0110	F	1011
7	0111	P	1110

LOCK function

The function aims to detect locked dialing number to prevent a long distance call. The dialing output of the chip is disabled if the first input key after on-off-hook is the locked number when the lock function is enabled. The lock function selection is listed on the table. This function is implemented on both the HT9305xL/HT9305xI and HT9305xLT/HT9305xIT.

The HT9305x/HT9306x and HT9305xT do not support this function.

R _{K31}	R _{K41}	Function
No	No	Keyboard operated IDD lock (not supported for HT9305xI & HT9305xIT)
No	Yes	Lock 0
Yes	No	Lock 0, 9
Yes	Yes	All keys are locked

Key definition

- 0,1,2,3,4,5,6,7,8,9 keys
 These are dialing number input keys for both the pulse mode and the tone mode operations.
- */T
 This key executes the P→T function and waits a T_{P→T} duration in the pulse mode. On the other hand, the */T key executes the * function in the tone mode.
- #
 This is a dialing signal key for the tone mode only, no response in the pulse mode.
- SA
 Pressing this key can save the preceding dialing telephone numbers. The saved number is redialed if it is pressed again. SA will also redial the saved number if it is the first key pressed at the off-hook state. During the dialing signal transmission, the SA key is inhibited.
- F
 The flash key can be selected as a digit or as a control key by the option resistors R_{K13} & R_{K14}. Pressing the flash key will force the \overline{PO} pin to be "low" for the T_F duration and is then followed by T_{FP} (sec). T_F can also be selected by R_{K13}, R_{K14}.
- P
 Pause key. The execution of this key pauses the output for the T_P duration. T_P can be selected by R_{K21}.
- R
 Redial key. Executes redialing as well as one-key redial function.

- **ST**
Store key. The execution of this key can activate the store memory function with (or without) dialing output and it can store lock numbers with personal code in IDD lock operation. During the dialing signal transmission, the ST key is inhibited.
- **R/P**
Redial and pause function key. If it is pressed

as the first key after off-hook, this key executes the redial function. Otherwise, it works as the pause key.

- **EM1~EM3**
One-touch memory dialing key. For speed-calling convenience, they provide memory dialing in either pulse or tone mode.

Keyboard operation

The following operations are described under an on-off-hook or on-hook with the hand-free active condition.

- Normal dialing

– Pulse mode

(a) without */T

Keyboard input: D1 D2 ... Dn

Dialing output: D1 D2 ... Dn

RM: D1 D2 ... Dn

SAM: Unchanged

(b) with */T

Keyboard input: D1 D2 ... Dn */T Dn+1 ... Dm

Dialing output: D1 D2 ... Dn $T_{P \rightarrow T}$ Dn+1 ... Dm
Pulse Tone

RM: D1 D2 ... Dn */T Dn+1 ... Dm

SAM: Unchanged

– Tone mode

(a) without */T

Keyboard input: D1 D2 ... Dn

Dialing output: D1 D2 ... Dn

RM: D1 D2 ... Dn

SAM: Unchanged

(b) with */T

Keyboard input: D1 D2 ... Dn */T Dn+1 ... Dm

Dialing output: D1 D2 ... Dn * Dn+1 ... Dm

RM: D1 D2 ... Dn * Dn+1 ... Dm

SAM: Unchanged

Note: The maximum capacity of the RM memory is 32 digits. When more than 32 digits are entered, the signal is transmitted but the redial function is inhibited.

- Redial

– Pulse mode

(a) without */T

RM content: D1 D2 ... Dn

Keyboard input: [R] or [R/P]

Dialing output: D1 D2 ... Dn

RM: Unchanged

SAM: Unchanged

(b) with */T

 Dialing output: D1 D2 ... Dn TF TFP Dn+1 ...
 Dm
 RM: Dn+1 ... Dm
 SAM: Unchanged

Note: TF: break a flash time

• Pause

Keyboard input: [D1] [D2] ... [Dn] [P or R/P] [Dn+1] ... [Dm]
 Dialing output: D1 D2 ... Dn TP Dn+1 ... Dm
 RM: D1 D2 ... Dn P Dn+1 ... Dm
 SAM: Unchanged

- Memory store

- Memory store without dialing output

Keyboard input: ...

Dialing output: D1 D2 ... Dn

RM: D1 D2 ... Dn

SAM: Unchanged

- Memory store with dialing output

Keyboard input: ...

Dialing output: D1 D2 ... Dn

RM: D1 D2 ... Dn

SAM: Unchanged

Note: If the dialing number exceeds 32 digits, the memory store is inhibited.

However, if the dialing number is not more than 32 digits the memory will store a max. of 16 digits.

EMa=EM1~EM3

- Memory dialing

EMa content: D1 D2 ... Dn

Keyboard input:

Dialing output: D1 D2 ... Dn

RM: D1 D2 ... Dn

SAM: Unchanged

Note: EMa=EM1~EM3

- Chain dialing

EM1 content: D1 D2 ... Dn

EM2 content: Dn+1 ... Dm

Keyboard input:

Dialing output: D1 D2 ... D3 D1 D2 ... Dn Dn+1 ... Dm

EM1: Unchanged

EM2: Unchanged

RM: D1 D2 ... Dn

SAM: Unchanged

Note: The maximum capacity of the RM memory is 32 digits. When the dialing number is over 32 digits, the redialing is inhibited and $\overline{PO}=VDD$

- Note:

RM: Redial memory

SAM: Save dialing memory

D1 D2 ... Dn: 0~9

Dn+1 ... Dm: 0~9, *, #

- IDD lock operation by the keyboard (2 lock numbers, 3 digits/number at maximum)

- Personal/Lock No.1/Lock No.2 input operation

- (a) Personal code doesn't exist

- Stores Personal Code: ST D1 D2 D3 ST * 0

- Stores Lock No.1: ST D4 D5 D6 ST * 1

- Stores Lock No.2: ST D7 D8 D9 ST * 2

- (b) Personal code exist

- Changes Personal Code: ST D1 D2 D3 ST # ST D4 D5 D6 ST * 0

- (Old personal code) (New personal code)

- Changes Lock No.1: ST D1 D2 D3 ST # ST D4 D5 D6 ST * 1

- (Personal code) (Lock No.1)

- Changes Lock No.2: ST D1 D2 D3 ST # ST D7 D8 D9 ST * 2

- (Personal code) (Lock No.2)

- Changes Personal Code, Lock No.1 and Lock No.2 at one time

- ST D1 D2 D3 ST # ST D4 D5 D6 ST * 0 (continued)

- (Old personal code) (New personal code)

- ST D7 D8 D9 ST * 1 ST D10 D11 D12 ST * 2

- (Lock No.1) (Lock No.2)

- Personal/Lock No.1/Lock No.2 cancel operation

- Cancels Personal code: ST D1 D2 D3 ST # ST # 0

- Cancels Lock No.1: ST D1 D2 D3 ST # ST # 1

- Cancels Lock No.2: ST D1 D2 D3 ST # ST # 2

- Temporary release both of the lock numbers (Lock No.1, Lock No.2):

- ST D1 D2 D3 ST # Dm Dm+1 Dm+2 D1 ... Dn

- (Personal code)

- Note: D1~D12 = 0~9

- Dm Dm+1 Dm+2 = 0~9

- D1 ... Dn = 0~9, *, #

- Note:

- RM: Redial memory

- SAM: Save dialing memory

- D1 D2 ... Dn: 0~9

- Dn+1 ... Dm: 0~9, *, #

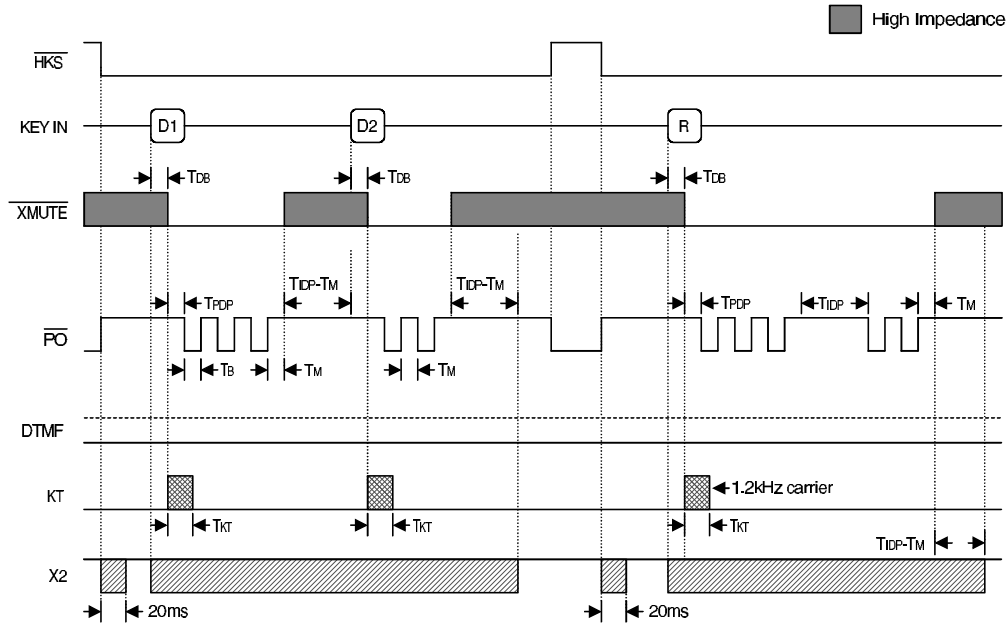

- Dm+1 ... D1: 0~9, *, #

- D1+1 ... DK: 0~9, *, #

D2=2

Application Circuits

Application circuit 1

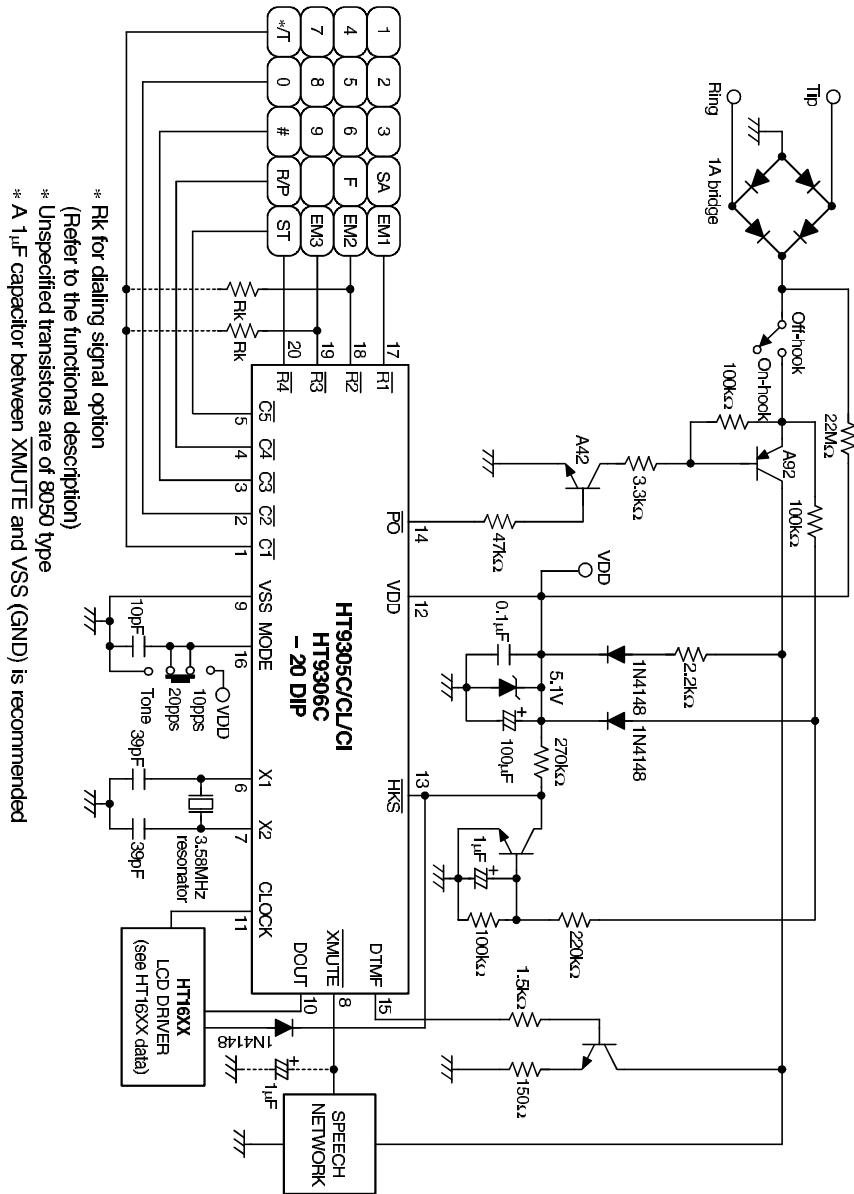

Application circuit 2

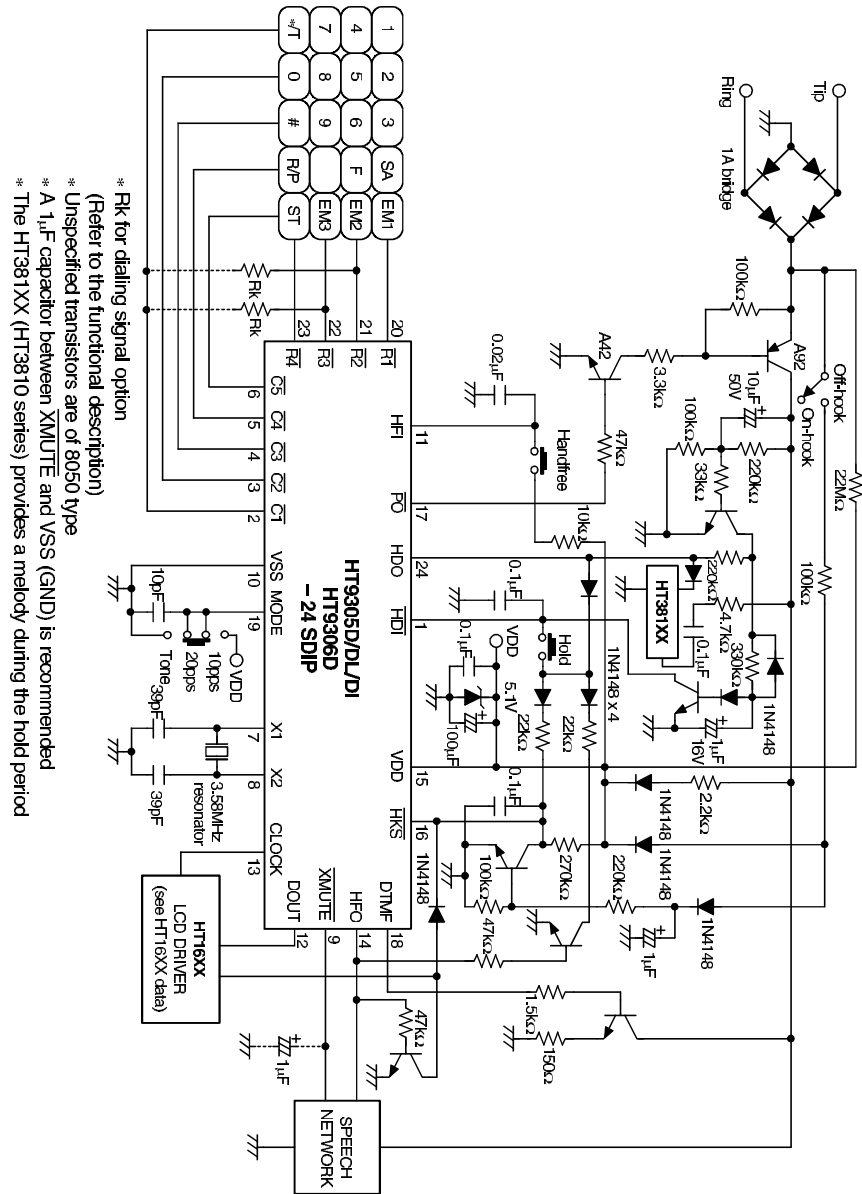

- * Rk for dialing signal option
(Refer to the functional description)
- * Unspecified transistors are of 8050 type
- * A 1.1 μ F capacitor between XMUTE and VSS (GND) is recommended
- * The HT381XX (HT3810 series) provides a melody during the hold period

Application circuit 3

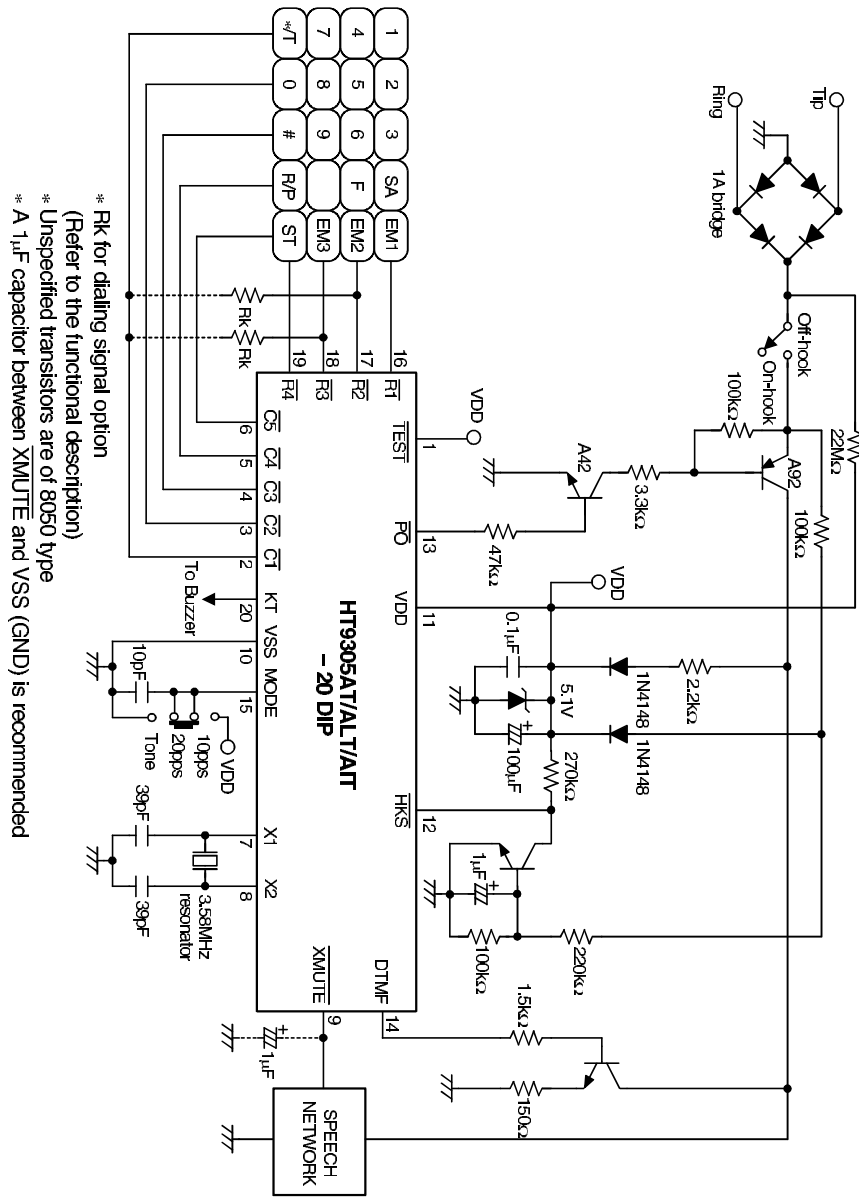

* Rk for dialling signal option
(Refer to the functional description)
* Unspecified transistors are of 8050 type
* A 1uF capacitor between XMUTE and VSS (GND) is recommended

Application circuit 4

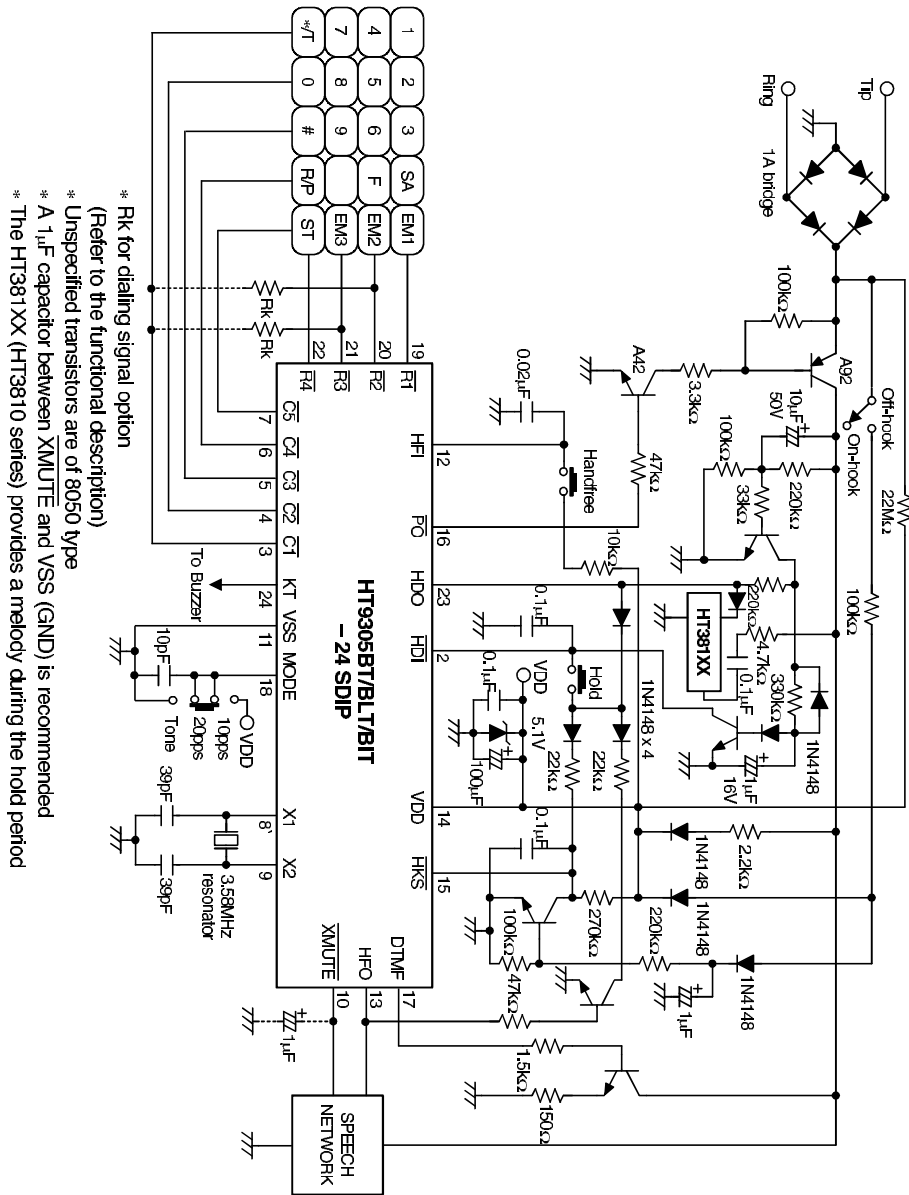

* Fk for dialling signal option
 (Refer to the functional description)
 * Unspecified transistors are of 8050 type
 * A 1µF capacitor between XMUTE and VSS (GND) is recommended
 * The HT381XX (HT3810 series) provides a melody during the hold period

Application circuit 5

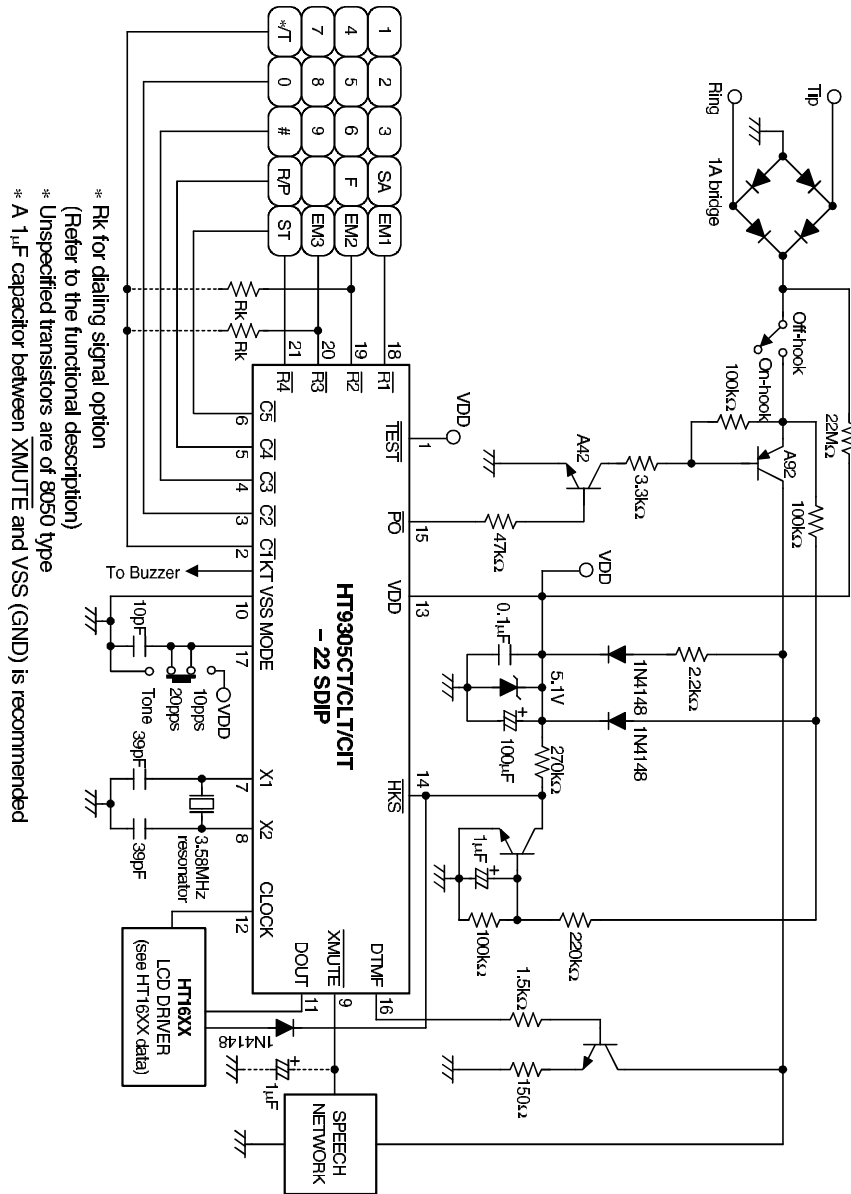

Application circuit 6

- * Rk for dialling signal option
(Refer to the functional description)
- * Unspecified transistors are of 8050 type
- * A 1µF capacitor between XMLUTE and VSS (GND) is recommended
- * The HT381XX (HT3810 series) provides a melody during the hold period

Application circuit 7

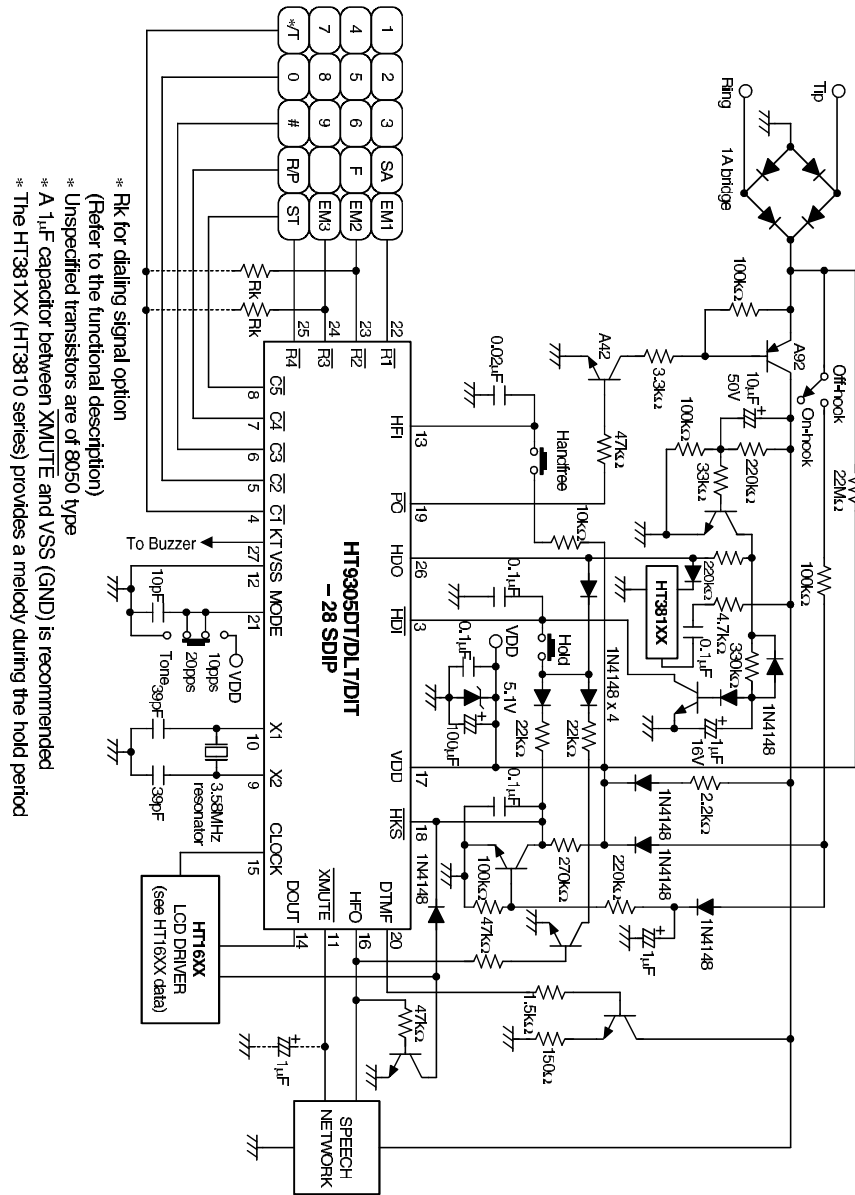

* Rk for dialing signal option
(Refer to the functional description)

* Unspecified transistors are of 8050 type

* A 1µF capacitor between XMUTE and VSS (GND) is recommended

Application circuit 8

- * Rk for dialing signal option
(Refer to the functional description)
- * Unspecified transistors are of 8050 type
- * A 1.µF capacitor between XMUTE and VSS (GND) is recommended
- * The HT3811XX (HT3810 series) provides a melody during the hold period
