## 4.0 OPTICAL SPECIFICATIONS

### 4.1 Overview

The test of optical specifications shall be measured in a dark room (ambient luminance  $\leq 1$  lux and temperature =  $25 \pm 2^\circ\text{C}$ ) with the equipment of Luminance meter system (Goniometer system and TOPCON BM-5A) and test unit shall be located at an approximate distance 50cm from the LCD surface at a viewing angle of  $\theta$  and  $\Phi$  equal to  $0^\circ$ . We refer to  $\theta_{\Phi=0}$  ( $=\theta_3$ ) as the 3 o'clock direction (the "right"),  $\theta_{\Phi=90}$  ( $=\theta_{12}$ ) as the 12 o'clock direction ("upward"),  $\theta_{\Phi=180}$  ( $=\theta_9$ ) as the 9 o'clock direction ("left") and  $\theta_{\Phi=270}$  ( $=\theta_6$ ) as the 6 o'clock direction ("bottom"). While scanning  $\theta$  and/or  $\Phi$ , the center of the measuring spot on the Display surface shall stay fixed.  $V_{CC}$  shall be  $3.3 \pm 0.3\text{V}$  at  $25^\circ\text{C}$ .

Notes :

1. Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing angles are determined for the horizontal or 3, 9 o'clock direction and the vertical or 6, 12 o'clock direction with respect to the optical axis which is normal to the LCD surface (see Figure1).

2. Contrast measurements shall be made at viewing angle of  $\Theta = 0$  and at the center of the LCD surface. Luminance shall be measured with all pixels in the view field set first to white, then to the dark (black) state (see Figure1). Luminance Contrast Ratio (CR) is defined mathematically as  $CR = \text{Luminance when displaying a white raster} / \text{Luminance when displaying a black raster}$ .

3. Reference only / Standard Front Surface Treatment Measured with green cover glass. The color chromaticity coordinates specified in Table 4 shall be calculated from the spectral data measured with all pixels first in red, green, blue and white. Measurements shall be made at the center of the panel.

4. The luminance value of 400 cd/m<sup>2</sup> means the brightness of PWM is 100%. The luminance value of 30 cd/m<sup>2</sup> means the brightness of lower PWM. CTF means that measure brightness at only center point at Figure 2.

### 4.3 Optical Measurements

**Figure 1. Measurement Set Up**

**Figure 2. Uniformity Measurement Locations (9 points)**

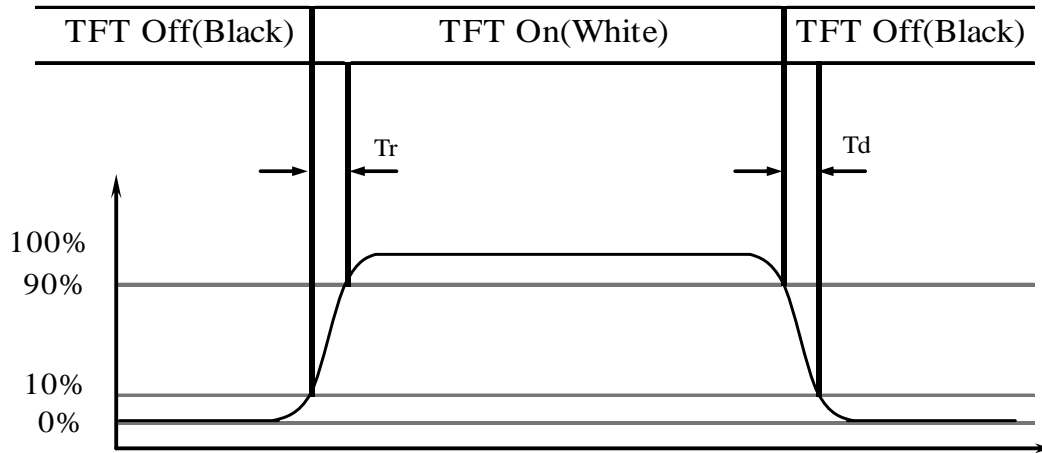

Note 5.

The White luminance uniformity on LCD surface is then expressed as :

$\Delta Y = ( \text{Minimum Luminance of 9 points} / \text{Maximum Luminance of 9 points} ) * 100$  Refer Figure 2 about measurement points

\* LED Condition = (Duty Ratio 100%, LED current 20mA)

**Figure 3. Response Time Testing**

**Figure 4. Cross Modulation Test Description**

$$\text{Cross-Talk (\%)} = \left| \frac{Y_B - Y_A}{Y_B} \right| \times 100$$

Where:

$Y_A$  = Initial luminance of measured area (cd/m<sup>2</sup>)

$Y_B$  = Subsequent luminance of measured area (cd/m<sup>2</sup>)

The location measured will be exactly the same in both patterns

Note 6.

The electro-optical response time measurements shall be made as Figure 3 by switching the "data" input signal ON and OFF. The times needed for the luminance to change from 10% to 90% is Tr, and 90% to 10% is Td.

Note 7.

Cross-Talk of one area of the LCD surface by another shall be measured by comparing the luminance ( $Y_A$ ) of a 25mm diameter area, with all display pixels set to a gray level, to the luminance ( $Y_B$ ) of that same area when any adjacent area is driven dark (Refer to Figure 4).

## 10.0 POWER SEQUENCE

To prevent a latch-up or DC operation of the LCD module, the power on/off sequence shall be as shown in below

Parameter	Value			Unit	Remark
	Min.	Typ.	Max.		
T1	0.5		10	ms	
T2	0		16	ms	
T3	200			ms	
T4	200			ms	
T5	0			ms	
T6	3			ms	
T7	400			ms	

- Notes :
1. When the power supply VDD is 0V, Keep the level of input signals on the low or keep high impedance.
  2. Do not keep the interface signal high impedance when power is on.
  3. Back Light must be turn on after power for logic and interface signal are valid.
