

32-Channel Serial to Parallel Converter With High Voltage Push-Pull Outputs

Features

- ▶ Processed with HVCMOS® technology
- ▶ Low power level shifting
- ▶ Shift register speed 8.0MHz
- ▶ Latched data outputs
- ▶ 5.0V CMOS compatible inputs
- ▶ Diode to V_{PP} allows efficient power recovery

General Description

The HV9308 is a low voltage serial to high voltage parallel converter with push-pull outputs. This device has been designed for use as a driver for AC-electroluminescent displays. It can also be used in any application requiring multiple output, high voltage current sourcing and sinking capabilities such as driving plasma panels, vacuum fluorescent, or large matrix LCD displays.

This device consists of a 32-bit shift register, 32 latches, and control logic to enable outputs. HV_{OUT1} is connected to the first stage of the shift register through the Output Enable logic. Data is shifted through the shift register on the low to high transition of the clock. The HV9308 shifts in the clockwise direction when viewed from the top of the package. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register (32). Operation of the shift register is not affected by the LE (latch enable) or the OE (output enable) inputs. Transfer of data from the shift register to the latch occurs when the LE input is high. The data in the latch is retained when LE is low.

Absolute Maximum Ratings

Parameter	Value
Supply voltage, V_{DD}	-0.5V to +7.0V
Supply voltage, V_{PP}	-0.5V to +90V
Logic input levels	-0.5V to $V_{DD} + 0.5V$
Ground current ¹	1.5A
Continuous total power dissipation ²	1200W
Operating temperature range	-40 to +85°C
Storage temperature range	-65 to +150°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

Notes:

- Duty cycle is limited by the total power dissipated in the package.
- For operation above 25°C ambient derate linearly to maximum operating temperature at 20mW/°C.

Power-Up Sequence

1. Connect ground
2. Apply V_{DD}
3. Set all inputs (Data, CLK, Enable, etc.) to a known state
4. Apply V_{PP}

Power-down sequence should be the reverse of the above.

The V_{PP} should not drop below V_{DD} during operations.
