

Off-Line Current Source Controller

Introduction

The HV9906DB4 provides a constant current of 750mA. It contains all circuitry necessary to demonstrate the features of the HV9906 second order power supply controller. A power converter of the demo board consists of an input buck-boost stage and an output buck stage. The output voltage polarity is negative. Due to its unique quadratic input-to-output DC voltage transfer ratio, the converter can operate directly off AC line to produce low-voltage output without need for electrolytic capacitors. The HV9906 is designed for optimally controlling this type of power converter or other types of two-stage multi-converters.

The board is optimized for driving a 10V-20V, 750mA load. However, it may be modified to meet custom requirements (up to 80V or 1.5A).

HV9906DB4 demo board features passive power factor correction to PF>0.95, open circuit protection and under voltage lockout.

Specification

Input Voltage	80 to 135VAC, 60Hz
Output Current	750mA ±10%
Output Voltage	20V Max
Efficiency	64% at Io=750mA, Vin=100VAC

Board Layout and Connections

Instructions

OUT, RTN

Connect your LED to these terminals: negative to OUT, positive to RTN.

E1, E2

Connect 80 to 135VAC, 60Hz line source to these terminals: line to E2, neutral to E1. The input is protected with a 0.5A fuse.

DC, AGND

Leave DC, AGND open if dimmer control is not required. Connect DC and AGND with an adjustable

Resistor R_{adj} can change the output current. The output current is:

$$I_{out} = \frac{R1 + R6 + R8 - R7 // (R11 + R_{adj})}{R7 // (R11 + R_{adj}) \cdot R3} \cdot 1V$$

Setting Output Current (without Dimmer Control)

Output current is preset to 750mA for this board. Output current can be re-programmed according to the following equation:

$$I_{out} = \frac{R1 + R6 + R8 - R7}{R7 \cdot R3} \cdot 1V$$
