

## 24-Bit Analog-to-Digital Converter (ADC) with Built-in Temperature Sensor

### **DESCRIPTION**

Based on Avia Semiconductor's patented technology, HX710 is a precision 24-bit analog-to-digital converter (ADC) with built-in temperature sensor designed for weigh scales and industrial control applications to interface directly with a bridge sensor.

The input low-noise amplifier (PGA) has a fixed gain of 128, corresponding to a full-scale differential input voltage of  $\pm 20 \text{mV}$ , when a 5V reference voltage is connected to the VREF pin. On chip oscillator provides the system clock without any external component.

On-chip power-on-reset circuitry simplifies digital interface initialization. There is no programming needed for the internal registers. All controls to the HX710 are through the pins.

### **FEATURES**

- On-chip temperature measurement
- On-chip active low noise amplifier with a gain of 128
- On-chip oscillator requiring no external component
- On-chip power-on-reset
- Simple digital control and serial interface: pin-driven controls, no programming needed
- Selectable 10SPS or 40SPS output data rate
- Simultaneous 50 and 60Hz supply rejection
- Current consumption: normal operation < 1.2mA, power down < 1uA</li>
- Operation supply voltage range: 2.6 ~ 5.5V
- Operation temperature range: -40 ~ +85℃
- 8 pin SOP-8 or DIP-8 package

# **Pin Description**

Pin #	Name	Function	Description
1	VREF	Analog Input	Reference input voltage: 1.8 ~ 5.5V
2	AGND	Ground	Analog Ground
3	INN	Analog Input	Differential signal negative input
4	INP	Analog Input	Differential signal positive input
5	PD_SCK	Digital Input	Power down control (high active) and serial clock input
6	DOUT	Digital Output	Serial data output
7	DVDD	Power	Digital supply: 2.6 ~ 5.5V
8	AVDD	Power	Analog supply: 2.6 ~ 5.5V

**Table 1 Pin Description** 

# KEY ELECTRICAL CHARACTERISTICS

Parameter	Notes	MIN	ТҮР	MAX	UNIT
Full scale differential input voltage range	V(inp)-V(inn)		±3.9*VREF		mV
Common mode input range		AGND+0.9		AVDD-1.3	V
VREF input voltage range		1.8		AVDD	
Output data rate			10/80		Hz
Output data coding	2's complement	800000		7FFFF	HEX
Output settling time (1)			400/50		ms
Input offset drift			0.2		mV
Input referred noise			50		nV(rms)
Temperature drift	Input offset		±5		nV/℃
	Gain		±5		ppm/℃
Input common mode rejection			100		dB
Power supply rejection			100		dB
Power supply voltage	DVDD	2.6		5.5	V
rower suppry voltage	AVDD	2.6		5.5	V
Analog supply current	Normal		1100		μΑ
maiog supply current	Power down		0.3		
Digital aumaky august	Normal		100		μΑ
Digital supply current	Power down		0.2		

<sup>(1)</sup> Settling time refers to the time from power up, reset, input channel change and gain change to valid stable output data.

**Table 2 Key Electrical Characteristics** 

### **Analog Input**

The differential input is designed to interface directly with a bridge sensor's differential output. It has a fixed gain of 128. The large gains are needed to accommodate the small output signal from the sensor. When a 5V reference is used at the VREF pin, the full-scale differential input voltage range is  $\pm 20 \text{mV}$ .

### **Power Supply Options**

Digital power supply (DVDD) should be the same power supply as the MCU power supply.

Analog power supply (AVDD) should not be higher than the digital supply (DVDD).

A/D conversion reference voltage (VREF) should be connected to loadcell's supply voltage. It can be connected directly to AVDD or through a resistor to reduce the power consumption by the loadcell.

# Clock Source, Output Data Rate and Format

HX710 uses the on-chip oscillator as clock source. The nominal output data rate is 10 or 80SPS.

The output 24 bits of data is in 2's complement format. When input differential signal goes out of the 24 bit range, the output data will be saturated at 800000h (MIN) or 7FFFFFh (MAX), until the input signal comes back to the input range.

### **Serial Interface**

Pin PD\_SCK and DOUT are used for data retrieval, input selection, output data rate selection and power down controls.

When output data is not ready for retrieval, digital output pin DOUT is high. Serial clock input PD\_SCK should be low. When DOUT goes to low, it indicates data is ready for retrieval. By applying 25~27 positive clock pulses at the PD\_SCK pin, data is shifted out from the DOUT output pin. Each PD\_SCK pulse shifts out one bit, starting with the MSB bit first, until all 24 bits are shifted out. The 25<sup>th</sup> pulse at PD\_SCK input will pull DOUT pin back to high (Fig.2).

Input selection and output data rate selection is controlled by the number of the input PD\_SCK pulses (Table 3). PD\_SCK clock pulses should not be less than 25 or more than 27 within one conversion period, to avoid causing serial communication error.

PD_SCK Pulses	Input	Data Rate	
25	Differential input	10 Hz	
26	Temperature	40 Hz	
27	Differential input	40 Hz	

**Table 3 Input and Data Rate Selection** 

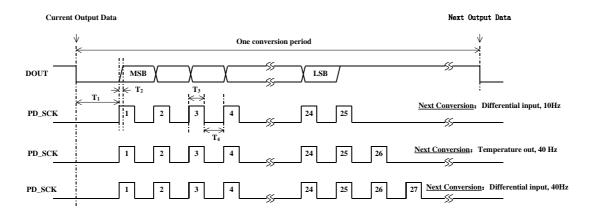

Fig.2 Data output, input and data rate selection timing and control

Symbol	Note	MIN	TYP	MAX	Unit
$T_1$	DOUT falling edge to PD_SCK rising edge	0.1			μs
$T_2$	PD_SCK rising edge to DOUT data ready			0.1	μs
T <sub>3</sub>	PD_SCK high time	0.2	1	50	μs
T <sub>4</sub>	PD_SCK low time	0.2	1		μs

### **Reset and Power-Down**

When chip is powered up, on-chip power on rest circuitry will reset the chip.

Pin PD\_SCK input is used to power down the HX710. When PD\_SCK Input is low, chip is in normal working mode.

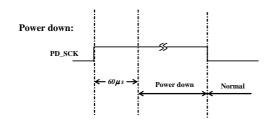

Fig.3 Power down control

When PD\_SCK pin changes from low to high and stays at high for longer than 60µs, HX710 enters power down mode (Fig.3). When PD\_SCK returns to low, chip will reset and enter normal operation mode.

After a reset or power-down event, input selection is default to differential input with 10 Hz output data rate.

### **Application Example**

Fig.1 is a typical weigh scale application using HX710.
