

DESCRIPTION

The HY62256A/ HY62256A-I is a high-speed, low power and 32,786 x 8-bits CMOS Static Random Access Memory fabricated using Hyundai's high performance CMOS process technology. The HY62256A/ HY62256A-I has a data retention mode that guarantees data to remain valid at the minimum power supply voltage of 2.0 volt. Using the CMOS technology, supply voltages from 2.0 to 5.5volt has little effect on supply current in the data retention mode. The HY62256A/HY62256A-I is suitable for use in low voltage operation and battery back-up application.

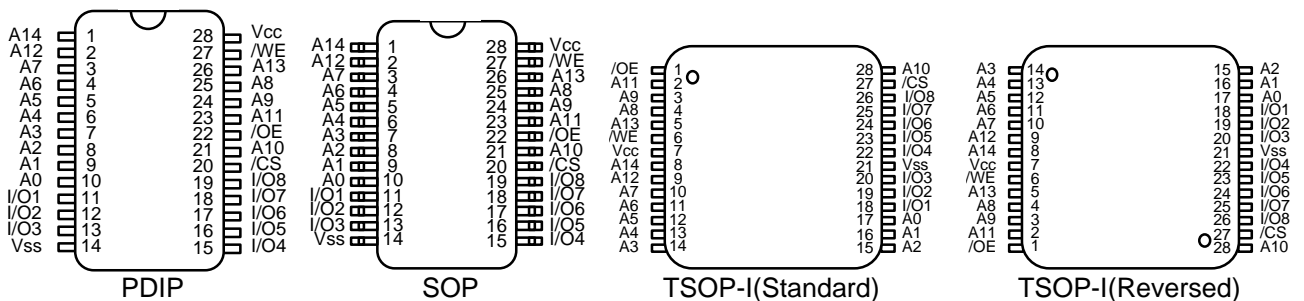

FEATURES

- Fully static operation and Tri-state output
- TTL compatible inputs and outputs
- Low power consumption
- Battery backup(L/LL-part)
 - 2.0V(min.) data retention
- Standard pin configuration
 - 28 pin 600 mil PDIP
 - 28 pin 330mil SOP
 - 28 pin 8x13.4 mm TSOP-I (Standard and Reversed)

Product No.	Voltage (V)	Speed (ns)	Operation Current(mA)	Standby Current(uA)			Temperature (°C)
					L	LL	
HY62256A	5.0	55/70/85	50	1mA	100	25	0~70(Normal)
HY62256A-I	5.0	55/70/85	50	1mA	100	-	-40~85(E.T.)

Note 1. E.T. : Extended Temperature, Normal : Normal Temperature
2. Current value is max.

TIMING DIAGRAM

READ CYCLE 1

Note(READ CYCLE):

1. t_{CHZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, t_{CHZ} max. is less than t_{CLZ} min. both for a given device and from device to device.
3. \overline{WE} is high for the read cycle.

READ CYCLE 2

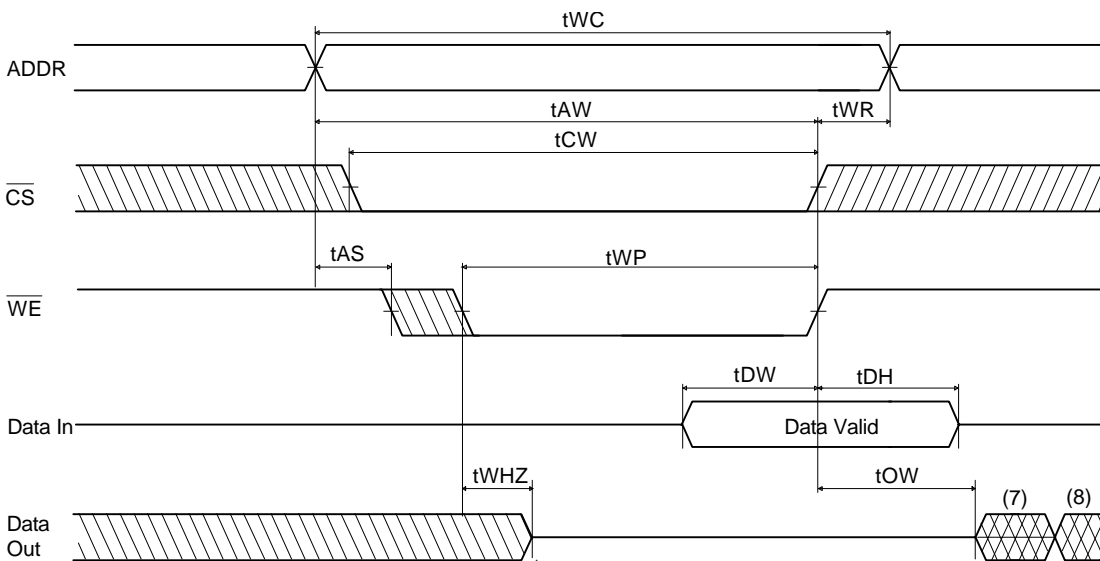

Note(READ CYCLE):

1. \overline{WE} is high for the read cycle.
2. Device is continuously selected $\overline{CS} = V_{IL}$.
3. $\overline{OE} = V_{IL}$.

WRITE CYCLE 1(/OE Clocked)

WRITE CYCLE 2 (/OE Low Fixed)

Notes(WRITE CYCLE):

1. A write occurs during the overlap of a low \overline{CS} and a low \overline{WE} . A write begins at the latest transition among \overline{CS} going low and \overline{WE} going low: A write ends at the earliest transition among \overline{CS} going high and \overline{WE} going high. t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of \overline{CS} going low to the end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change. t_{WR} is applied in case a write ends as \overline{CS} , or \overline{WE} going high.
5. If \overline{OE} and \overline{WE} are in the read mode during this period, and the I/O pins are in the output low-Z state, input of opposite phase of the output must not be applied because bus contention can occur.
6. If \overline{CS} goes low simultaneously with \overline{WE} going low, or after \overline{WE} going low, the outputs remain in high impedance state.
7. DOUT is the same phase of latest written data in this write cycle.
8. DOUT is the read data of the new address.
