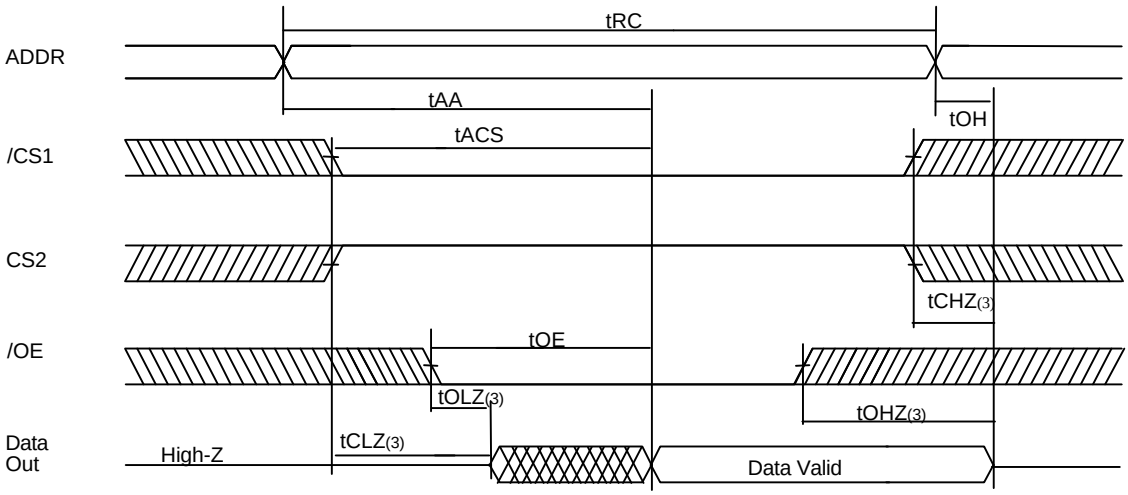
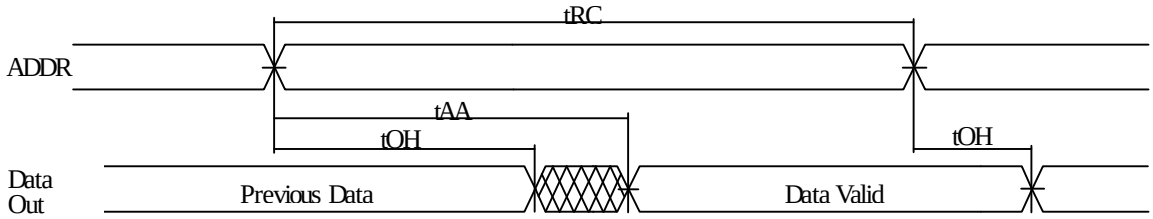
TIMING DIAGRAM

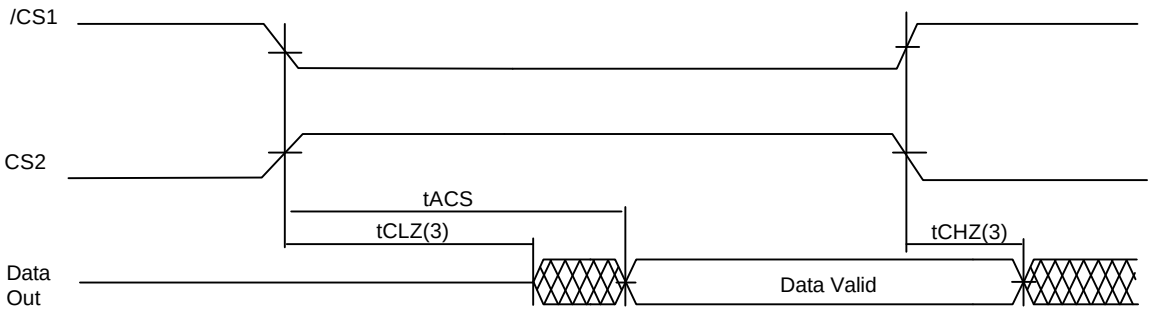
READ CYCLE 1 (Note 1,4)



READ CYCLE 2 (Note 1,2,4)

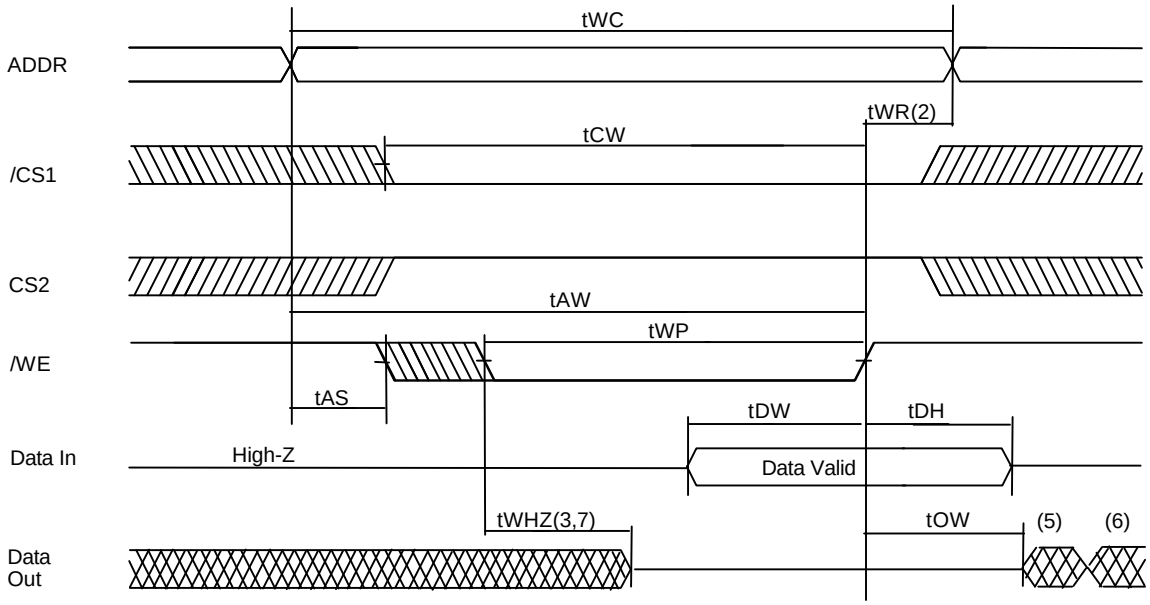


READ CYCLE 3 (Note 1,2,4)

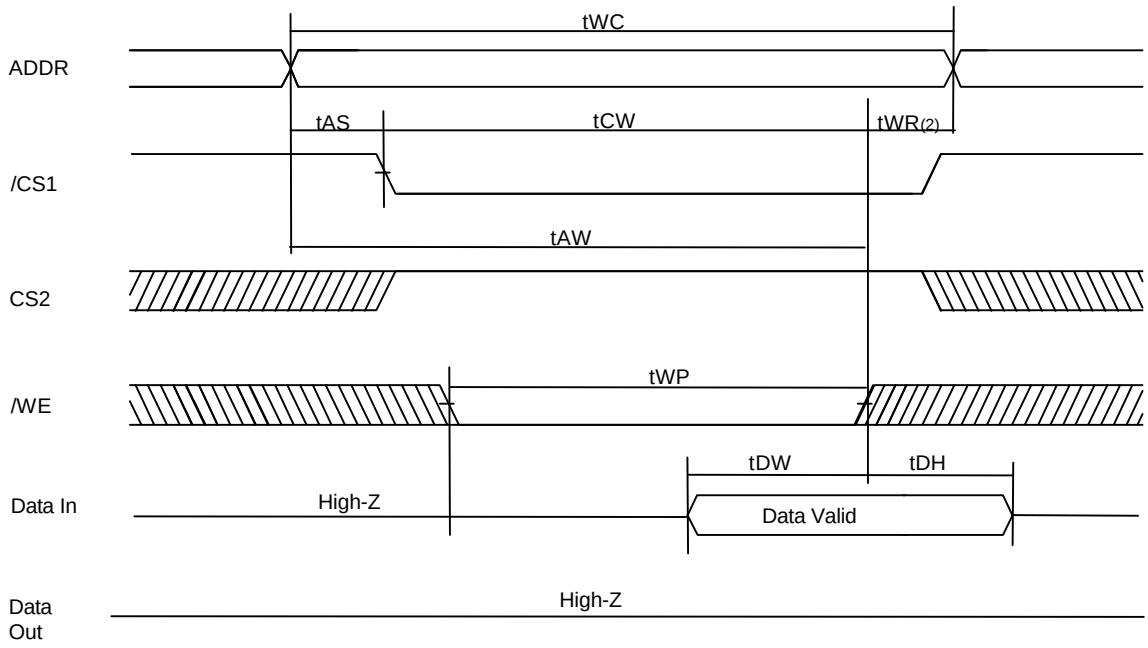


Notes:
1. Read Cycle occurs whenever a high on the /WE and /OE is low, while /CS1 and CS2 are in active status.
2. /OE = V_{IL}
3. Transition is measured ± 200mV from steady state voltage.
   This parameter is sampled and not 100% tested.
4. /CS1 in high for the standby, low for active
   CS2 in low for the standby, high for active.

WRITE CYCLE 1 (1,4,8) (/WE Controlled)



WRITE CYCLE 2 (Note 1,4,8) (/CS1, CS2 Controlled)



Notes:
1. A write occurs during the overlap of a low /WE, a low /CS1, a high CS2.
2. tWR is measured from the earlier of /CS1or /WE going high or CS2 going low to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the output must not be applied.
4. If the /CS1, CS2 high transition occur simultaneously with the /WE low transition or after the /WE transition, outputs remain in a high impedance state.
5. Q(data out) is the same phase with the write data of this write cycle.
6. Q(data out) is the read data of the next address.
7. Transition is measured ± 200mV from steady state. This parameter is sampled and not 100% tested.
8. /CS1 in high for the standby, low for active. CS2 in low for the standby, high for active.
