

# HYC9088A Half Height

## ARCNET® Twisted Pair and Coaxial Compatible High Impedance Transceiver HIT™

### FEATURES

- ARCNET on Twisted Pair or Coaxial Cable
- Drives Shielded and Unshielded Twisted Pair Cable or Coaxial Cable
- Compatible with Existing ARCNET Installations
- 2.5 Mbps operation
- Pin Compatible with the ARCNET HYC9068 LAN Driver with the Addition of a Single Terminating Resistor
- Supports Star, Bus, and Daisy Chained Configurations
- Enhanced Built-in Filters for Reduced EMI
- Twenty Pin Single In-Line Package
- Straight or Right Angle Lead Frame
- New Reduced Size

### GENERAL DESCRIPTION

The HYC9088 Twisted Pair and Coaxial Compatible High Impedance Transceiver (HIT) is a hybrid module that interfaces an ARCNET Local Area Network controller to one twisted pair or coaxial cable. The HIT interfaces directly with Standard Microsystems Corporation's ARCNET LAN controllers operating at 2.5 Mbps and connects to a variety of shielded and unshielded twisted pair or coaxial cables via an on-board transformer. The network topologies supported by the HIT are daisy chain, star, and bus configurations.

During data transmission, the HIT converts the digital pulse information provided by the LAN controller into analog signals and drives them onto the cable. The transmitted signals are filtered to eliminate undesirable frequencies. The receiver section of the HYC9088 identifies dipulse signals

on the cable and converts them into TTL signals to be supplied to the LAN controller.

The HIT supports ARCNET's Dipulse Encoding Scheme and, is 100% compatible with all existing coax-based ARCNET networks. This provides an ARCNET network designer with flexibility to easily combine coax and twisted pair cabling.

The HYC9088 is pin compatible with the HYC9058 High Impedance Transceiver and is pin compatible with the HYC9068 LAN Driver with the addition of a single terminating resistor.

### PIN CONFIGURATION

et4U.com

DataShee

**DESCRIPTION OF PIN FUNCTIONS**

<b>PIN NO.</b>	<b>NAME</b>	<b>SYMBOL</b>	<b>DESCRIPTION</b>
1, 2, 5, 9	No Connect	NC	Not used. Make no connection to these pins.
3	Power Supply	VDD	-5 Volts power supply.
4, 13, 14, 17	Ground	GND	Ground.
6	Power Supply	VCC	+5 Volts power supply.
7	Receive Data	RX	Output. This signal carries the TTL receive pulse information to the ARCNET LAN Controller Device.
8, 16, 15, 10	Test Points	TPA, TPB, TPC, TPD	Test points. Make no connection to these pins.
11	Phase-B/ Shield	PH-B/ SHIELD	Output. Connect this signal to Twisted Pair Connector pin 3 or the shield of the coaxial cable.
12	Phase-A/ Center	PH-A/ CENTER	Output. Connect this signal to Twisted Pair Connector pin 2 or the center of the coaxial cable.
18	nPulse 2	nPULSE2	Input. This signal is supplied by the ARCNET LAN Controller Device.
19	Disable TX	DISABLE TRANSMIT	Input. A high level on this signal disables the transmit section of the HYC9088. It is normally connected to ground.
20	nPulse 1	nPULSE1	Input. This signal is supplied by the ARCNET LAN Controller Device.

## FUNCTIONAL DESCRIPTION

The HIT integrates a host of discrete components into a hybrid module and provides the Local Area Network designer with space and cost savings as well as the enhanced reliability of a single component. Since the HIT is a high impedance transceiver, it does not disturb the characteristic impedance of the cable used to interconnect ARCNET nodes. The two far ends of the twisted pair cable must be terminated using terminating resistors equal to the characteristic impedance of the cable. The HIT is made up of a transmit section and a receive section. (Please refer to Figure 1).

### Transmit Section

The ARCNET LAN controller transmits a logic "1" by generating two 100 ns non-overlapping negative pulses, nPULSE1 and nPULSE2. These signals are converted by the HIT into a 200 ns dipulse signal. The HIT shapes the 200 ns signal into a single cycle of a 5 MHz sine-wave and filters higher frequency components. The dipulse signal is then transformer-coupled onto the cable and has a minimum voltage output of

16 Volts peak-to-peak. The exact output voltage of the HIT will vary depending on the characteristic impedance of the cable used. The driving circuitry of the HIT has been designed to present a high impedance on the cable in order to minimize loading.

The DISABLE input of the HYC9088 can be used to prevent the device from transmitting. During normal operation, the DISABLE input is tied to ground.

### Receiver Section

The received dipulse signal from the cable is electrically isolated through the use of a transformer. This signal is passed through a filter which eliminates out of band noise. The receive signal is then fed to a comparator which converts it into a TTL signal ready to be applied to the LAN controller chip. The comparator compares the received signal to an internal voltage threshold to distinguish noise from real signal.

---

## APPLICATION INFORMATION

### Small Twisted Pair Networks

The HIT eliminates the need for active hubs in small ARCNET networks. For example, a ten node ARCNET network can be constructed by connecting ten HITs using a daisy-chained or bus configuration (see Figure 2). Note that both extremes of the cable must be terminated with a resistor which matches the characteristic impedance of the Twisted Pair Cable. For the cable types specified in Table 1, the maximum length of the twisted pair cable recommended is 400 feet.

### Small Coax Network

No active hub is required for an ARCNET network consisting of eight nodes or less using the HYC9088 for coax cable (See Figure 2A). Both ends of the cable must be terminated with a resistor which matches the characteristic impedance of the coax cable. For the RG62 cable specified in Table 1, the maximum length of the coax cable recommended is 1000 feet.

### Combination of Twisted Pair and Coax Networks

A Two-Port Link is used to combine twisted pair network and a coax network. A Two-Port Link has a coax connector on one side and two modular jacks on the other and contains the proper impedance-matching circuitry. Refer to Figure 3 for an illustration of a twisted pair network combined with a coaxial network.

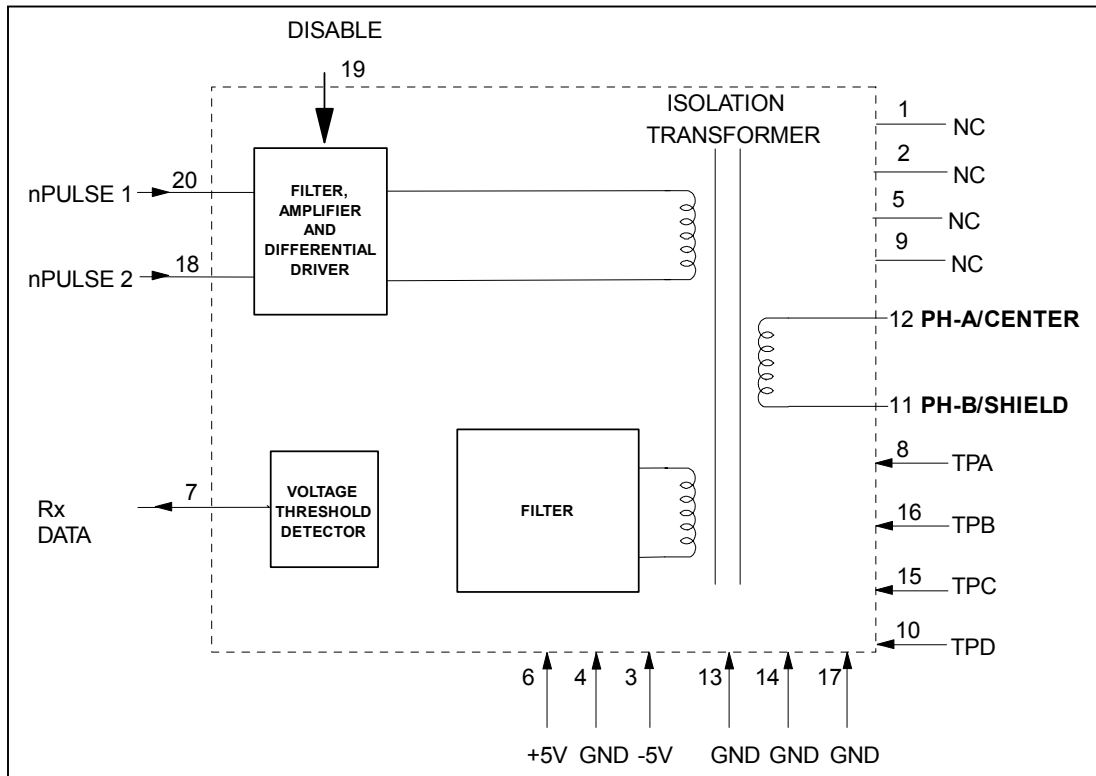

### Proper Connection for Twisted Pair

Each twisted pair compatible ARCNET node would typically have two RJ-11 modular

connectors mounted on the node card (refer to Figure 4). PHASE A should be connected to pin 2 of the connectors and PHASE B to pin 3. A twisted pair segment would have an RJ-11 modular jack on each end (see Figure 5). Please note that the suggested numbering scheme of the modular jack shown in Figure 5 may not be consistent with that found on some manufacturers' products. Please ensure consistent connection of Phase A and Phase B signals throughout the network to avoid the reception of erroneous data.

**Table 1 - Specifications for Cabling**

PARAMETER	VALUE FOR COAX	VALUE FOR TWISTED PAIR
Wiring	RG62	Solid Copper 22, 24, or 26 AWG
Number of Twists/Foot	N/A	2 min.
DC Resistance	3.4 Ohms/1000 ft.	28.6 Ohms/1000 ft. max.
Characteristic Impedance	93 Ohms at 1 MHz	105 Ohms . 20% at 1 MHz
Maximum Attenuation	5.5 dB/1000 ft. at 5 MHz	16.0 dB/1000 ft. at 5 MHz

## OPERATIONAL DESCRIPTION

### MAXIMUM GUARANTEED RATINGS\*

Operating Temperature Range ..... 0°C to +70°C  
 Storage Temperature Range ..... -55° to +150°C  
 Lead Temperature Range (soldering, 10 seconds) ..... +325°C  
 Positive Voltage on any pin, with respect to Ground .....  $V_{CC}+0.3V$   
 Negative Voltage on any pin, except  $V_{DD}$ , with respect to Ground ..... -0.3V

\*Stresses above those listed above could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other condition above those indicated in the operation sections of this specification is not implied.

Note: When powering this device from laboratory or system power supplies, it is important that the Absolute Maximum Ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested that a clamp circuit be used.

### DC ELECTRICAL CHARACTERISTICS ( $T_A = 0^\circ\text{C}$ to $70^\circ\text{C}$ , $V_{CC2} = +5.0\text{V} \pm 5\%$ , $V_{DD} = -5.0\text{V} \pm 5\%$ )

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	COMMENTS
Low Input Voltage	$V_{IL}$			0.8	V	$I_{IL} = -0.8\text{ mA}$
High Input Voltage	$V_{IH}$	2.0			V	$I_{IH} = +0.2\text{ mA}$
Received Signal Amplitude	$V_R$	6.0 3.0			$V_{p-p}$ $V_{o-p}$	
Low Output Voltage	$V_{OL}$			0.4	V	One TTL Load
High Output Voltage	$V_{OH}$	2.4			V	One TTL Load
Transformer Output	$V_T$	16 8	20 10		$V_{p-p}$ $V_{o-p}$	$Z_{chr\ cable} = 120\Omega$ or $93\Omega$
Cable Noise Amplitude	$V_C$			4	$V_{p-p}$	
$V_{CC}$ Supply Current	$I_{CC}$		190	285	mA	
$V_{DD}$ Supply Current	$I_{DD}$		180	270	mA	
Pulse Width, nPulse 1, n2	PW		100		nS	

Shorting the transformer output may cause permanent damage to the device.
