 These SO-DIMM modules are based on 256Mbit SDRAM technology and can be used in applications only, where 256Mbit addressing is supported.

This INFINEON modules are industry standard 144 pin 8-byte Synchronous DRAM (SDRAM) Small Outline Dual In-line Memory Modules (SO-DIMM) which are organised as x64 high speed memory arrays designed for use in non-parity applications. These SO-DIMMs use 256Mbit SDRAMs in TSOPII packages. Decoupling capacitors are mounted on the board.

The DIMMs use serial presence detects implemented via a serial E²PROM using the two pin I²C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user.

All INFINEON 144-pin SO-DIMMs provide a high performance, flexible 8-byte interface in a 67,6 mm long footprint.

Notes:

- All AC characteristics shown are for SDRAM components.
 An initial pause of 100 μ s is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
- AC timing tests have $V_{il} = 0.4$ V and $V_{ih} = 2.4$ V with the timing referenced to the 1.4 V crossover point. The transition time is measured between V_{ih} and V_{il} . All AC measurements assume $t_T = 1$ ns with the AC output load circuit shown. Specified t_{ac} and t_{oh} parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1V / ns edge rate between 0.8V and 2.0 V.

- If clock rising time is longer than 1ns, a time ($t_T - 0.5$) ns has to be added to this parameter.
- If t_T is longer than 1ns, a time ($t_T - 1$) ns has to be added to this parameter.
- Any time that the refresh Period has been exceeded, a minimum of two Auto (CRB) Refresh commands must be given to “wake-up” the device.
- Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to t_{RC} is satisfied once the Self Refresh Exit command is registered.
- Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.

Serial Presence Detects:

A serial presence detect storage device - E²PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E²PROM device during module production using a serial presence detect protocol (I²C synchronous 2-wire bus)
