

# World's First Wide-Range 6-Axis MotionTracking Device for **High Speed Applications**

#### **GENERAL DESCRIPTION**

Many of today's wearable and sports solutions, which analyze the user's high speed motion, require higher full scale range (FSR) than currently available, to better ensure that critical data is not lost during high speed rotation. The ICM-20601 SoC offers the smallest size, lowest profile and lowest power in conjunction with industry leading high FSR.

With an extended FSR range of ±4000 dps for gyroscope and ±32g for accelerometer, the ICM-20601 enables precise motion tracking of high speed sports-related activity providing continuous sensor data throughout the motion, providing more accurate analysis.

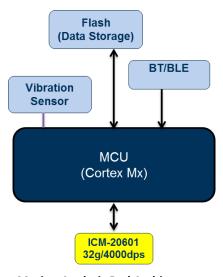

The ICM-20601 is the world's first wide-range 6-axis MotionTracking device for sports and other high speed applications. It is available in a 3 mm x 3 mm x 0.75 mm 16-pin LGA package.

#### **ORDERING INFORMATION**

| PART       | TEMP RANGE     | PACKAGE    |
|------------|----------------|------------|
| ICM-20601† | -40°C to +85°C | 16-Pin LGA |

<sup>†</sup>Denotes RoHS and Green-Compliant Package

#### **BLOCK DIAGRAM**

**Motion Analysis Pod Architecture** 

This document contains information on a pre-production

product. InvenSense Inc. reserves the right to change specifications and information herein without notice.

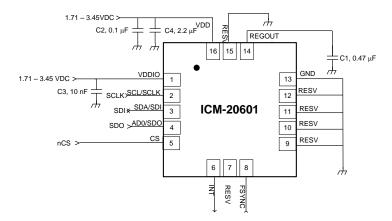

#### **APPLICATIONS**

- Sports
- Wearable Sensors

#### **FEATURES**

- 3-Axis Gyroscope with Programmable FSR of ±500dps, ±100dps, ±2000dps and ±4000dps
- 3-Axis Accelerometer with Programmable FSR of  $\pm 4g$ ,  $\pm 8g$ ,  $\pm 16g$ , and  $\pm 32g$
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- 512 byte FIFO buffer enables the applications processor to read the data in bursts
- On-Chip 16-bit ADCs and Programmable Filters
- Host interface: 8 MHz SPI or 400k Hz Fast Mode I<sup>2</sup>C
- Digital-output temperature sensor
- VDD operating range of 1.71 to 3.45V
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

#### TYPICAL OPERATING CIRCUIT

## 1 GENERAL DESCRIPTION

## 1.1 PURPOSE AND SCOPE

This document is a product specification, providing a description, specifications, and design related information on the ICM-20601™ MotionTracking device. The device is housed in a small 3 mm x 3 mm x 0.75 mm 16-pin LGA package.

#### 1.2 PRODUCT OVERVIEW

The ICM-20601 is a 6-axis MotionTracking device that combines a 3-axis gyroscope, and a 3-axis accelerometer in a small 3 mm x 3 mm x 0.75 mm (16-pin LGA) package. It also features a 512 byte FIFO that can lower the traffic on the serial bus interface, and reduce power consumption by allowing the system processor to burst read sensor data and then go into a low-power mode. ICM-20601, with its 6-axis integration, enables manufacturers to eliminate the costly and complex selection, qualification, and system level integration of discrete devices, guaranteeing optimal motion performance for consumers.

The gyroscope has a programmable full-scale range up to  $\pm 4000$  dps. The accelerometer has a user-programmable accelerometer full-scale range up to  $\pm 32g$ . Factory-calibrated initial sensitivity of both sensors reduces production-line calibration requirements.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I<sup>2</sup>C and SPI serial interfaces, a VDD operating range of 1.71V to 3.45V, and a separate digital IO supply, VDDIO from 1.71V to 3.45V. Communication with all registers of the device is performed using either I<sup>2</sup>C at 400 kHz or SPI at 8 MHz.

By leveraging its patented and volume-proven CMOS-MEMS fabrication platform, which integrates MEMS wafers with companion CMOS electronics through wafer-level bonding, InvenSense has driven the package size down to a footprint and thickness of 3 mm x 3 mm x 0.75 mm (16-pin LGA), to provide a very small yet high---performance, low-cost package. The device provides high robustness by supporting 10,000*g* shock reliability.

#### 1.3 APPLICATIONS

- High Impact Sports
- Wearable Sensors

## **FEATURES**

## **GYROSCOPE FEATURES**

The triple-axis MEMS gyroscope in the ICM-20601 includes a wide range of features:

- Digital-output X-, Y-, and Z-axis angular rate sensors (gyroscopes) with a user-programmable full-scale range of ±500 dps, ±1000 dps, ±2000 dps, and ±4000 dps, and integrated 16-bit ADCs
- Digitally-programmable low-pass filter
- Factory calibrated sensitivity scale factor
- Self-test

#### **ACCELEROMETER FEATURES** 2.2

The triple-axis MEMS accelerometer in ICM-20601 includes a wide range of features:

- Digital-output X-, Y-, and Z-axis accelerometer with a programmable full scale range of  $\pm 4q$ ,  $\pm 8q$ ,  $\pm 16q$ , and  $\pm 32q$ , and integrated 16-bit ADCs
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- Self-test

#### **ADDITIONAL FEATURES**

The ICM-20601 includes the following additional features:

- Smallest and thinnest LGA package for portable devices: 3 mm x 3 mm x 0.75 mm (16-pin LGA)
- Minimal cross-axis sensitivity between the accelerometer and gyroscope axes
- 512 byte FIFO buffer enables the applications processor to read the data in bursts
- Digital-output temperature sensor
- User-programmable digital filters for gyroscope, accelerometer, and temp sensor
- 10,000g shock tolerant
- 400 kHz Fast Mode I<sup>2</sup>C for communicating with all registers
- 8 MHz SPI serial interface for communicating with all registers
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

## 3 ELECTRICAL CHARACTERISTICS

## 3.1 GYROSCOPE SPECIFICATIONS

Typical Operating Circuit of section 0, VDD = 1.8 V, VDDIO = 1.8 V, T<sub>A</sub> = 25°C, unless otherwise noted.

## 3.6 ABSOLUTE MAXIMUM RATINGS

Stress above those listed as "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

| PARAMETER                                  | RATING                              |
|--|-------------------------------------|
| Supply Voltage, VDD                        | -0.5V to +4V                        |
| Supply Voltage, VDDIO                      | -0.5V to +4V                        |
| REGOUT                                     | -0.5V to 2V                         |
| Input Voltage Level (AD0, FSYNC, SCL, SDA) | -0.5V to VDD + 0.5V                 |
| Acceleration (Any Axis, unpowered)         | 10,000g for 0.2 ms                  |
| Operating Temperature Range                | -40°C to +85°C                      |
| Storage Temperature Range                  | -40°C to +125°C                     |

## **4.4 BLOCK DIAGRAM**

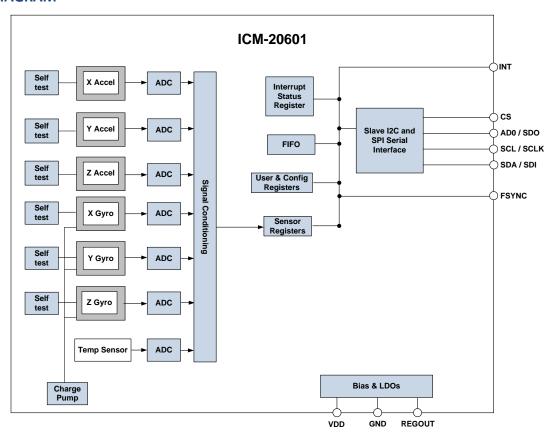

Figure 6. ICM-20601 Block Diagram

#### 4.5 OVERVIEW

The ICM-20601 is comprised of the following key blocks and functions:

- Three-axis MEMS rate gyroscope sensor with 16-bit ADCs and signal conditioning
- Three-axis MEMS accelerometer sensor with 16-bit ADCs and signal conditioning
- Primary I<sup>2</sup>C and SPI serial communications interfaces
- Self-Test
- Clocking
- Sensor Data Registers
- FIFO
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDOs
- Charge Pump
- Standard Power Modes

#### 4.6 THREE-AXIS MEMS GYROSCOPE WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-20601 consists of three independent vibratory MEMS rate gyroscopes, which detect rotation about the X-, Y-, and Z- Axes. When the gyros are rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pickoff. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using individual on-chip 16-bit Analog-to-Digital Converters (ADCs) to sample each axis. The full-scale range of the gyro sensors may be digitally programmed to ±500, ±1000, ±2000, or ±4000 degrees per second (dps). The ADC sample rate is programmable from 8,000 samples per second, down to 3.9 samples per second, and user-selectable low-pass filters enable a wide range of cut-off frequencies.

#### 4.7 THREE-AXIS MEMS ACCELEROMETER WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-20601's 3-Axis accelerometer uses separate proof masses for each axis. Acceleration along a particular axis induces displacement on the corresponding proof mass, and capacitive sensors detect the displacement differentially. The ICM-20601's architecture reduces the accelerometers' susceptibility to fabrication variations as well as to thermal drift. When the device is placed on a flat surface, it will measure 0g on the X- and Y-axes and +1g on the Z-axis. The accelerometers' scale factor is calibrated at the factory and is nominally independent of supply voltage. Each sensor has a dedicated sigma-delta ADC for providing digital outputs. The full scale range of the digital output can be adjusted to  $\pm 4g$ ,  $\pm 8g$ ,  $\pm 16g$ , or  $\pm 32g$ .

#### 4.8 I<sup>2</sup>C AND SPI SERIAL COMMUNICATIONS INTERFACES

The ICM-20601 communicates to a system processor using either a SPI or an  $I^2C$  serial interface. The ICM-20601 always acts as a slave when communicating to the system processor. The LSB of the  $I^2C$  slave address is set by pin 4 (AD0).

#### 4.8.1 ICM-20601 Solution Using I2C Interface

In Figure 7, the system processor is an I<sup>2</sup>C master to the ICM-20601.

Document Number: DS-000191 Page 22 of 51

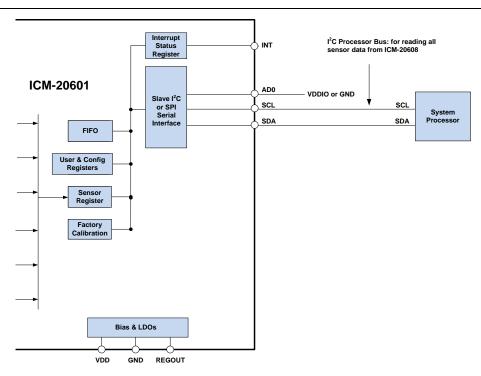

Figure 7. ICM-20601 Solution Using I<sup>2</sup>C Interface

## 4.8.2 ICM-20601 Solution Using SPI Interface

In Figure 8, the system processor is an SPI master to the ICM-20601. Pins 2, 3, 4, and 5 are used to support the SCLK, SDI, SDO, and CS signals for SPI communications.

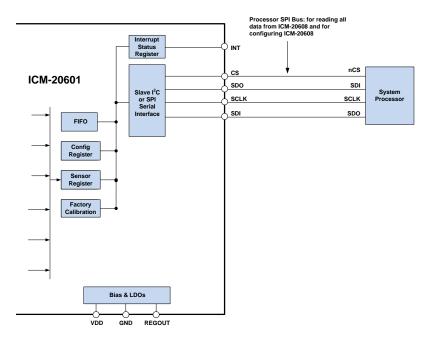

Figure 8. ICM-20601 Solution Using SPI Interface

#### 4.9 SELF-TEST

Self-test allows for the testing of the mechanical and electrical portions of the sensors. The self-test for each measurement axis can be activated by means of the gyroscope and accelerometer self-test registers (registers 27 and 28).

When the self-test is activated, the electronics cause the sensors to be actuated and produce an output signal. The output signal is used to observe the self-test response.

The self-test response is defined as follows:

SELF-TEST RESPONSE = SENSOR OUTPUT WITH SELF-TEST ENABLED — SENSOR OUTPUT WITH SELF-TEST DISABLED

The self-test response for each gyroscope axis is defined in the gyroscope specification table, while that for each accelerometer axis is defined in the accelerometer specification table.

When the value of the self-test response is within the specified min/max limits of the product specification, the part has passed self-test. When the self-test response exceeds the min/max values, the part is deemed to have failed self-test. It is recommended to use InvenSense MotionApps software for executing self-test.

#### 4.10 CLOCKING

The ICM-20601 has a flexible clocking scheme, allowing a variety of internal clock sources to be used for the internal synchronous circuitry. This synchronous circuitry includes the signal conditioning and ADCs, and various control circuits and registers. An on-chip PLL provides flexibility in the allowable inputs for generating this clock.

Allowable internal sources for generating the internal clock are:

- a) An internal relaxation oscillator
- b) Auto-select between internal relaxation oscillator and gyroscope MEMS oscillator to use the best available source

The only setting supporting specified performance in all modes is option b). Use of option b) is recommended.

### 4.11 SENSOR DATA REGISTERS

The sensor data registers contain the latest gyroscope, accelerometer, and temperature measurement data. They are read-only registers, and are accessed via the serial interface. Data from these registers may be read anytime.

#### 4.12 FIFO

The ICM-20601 contains a 512 byte FIFO register that is accessible via the Serial Interface. The FIFO configuration register determines which data is written into the FIFO. Possible choices include gyro data, accelerometer data, temperature readings, and FSYNC input. A FIFO counter keeps track of how many bytes of valid data are contained in the FIFO. The FIFO register supports burst reads. The interrupt function may be used to determine when new data is available.

The ICM-20601 allows FIFO read in standard (duty cycle) accelerometer mode.

#### 4.13 INTERRUPTS

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the INT pin configuration, the interrupt latching and clearing method, and triggers for the interrupt. Items that can trigger an interrupt are (1) Clock generator locked to new reference oscillator (used when switching clock sources); (2) new data is available to be read (from the FIFO and Data registers); (3) accelerometer event interrupts; (4) FIFO overflow. The interrupt status can be read from the Interrupt Status register.

## 4.14 DIGITAL-OUTPUT TEMPERATURE SENSOR

An on-chip temperature sensor and ADC are used to measure the ICM-20601 die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

#### 4.15 BIAS AND LDOS

The bias and LDO section generates the internal supply and the reference voltages and currents required by the ICM-20601. Its two inputs are an unregulated VDD and a VDDIO logic reference supply voltage. The LDO output is bypassed by a capacitor at REGOUT. For further details on the capacitor, please refer to the Bill of Materials for External Components.

Document Number: DS-000191 Page 24 of 51

Revision: 1.0

## 4.16 CHARGE PUMP

An on-chip charge pump generates the high voltage required for the MEMS oscillator.

## 4.17 POWER MODES

The following table lists the user-accessible power modes for ICM-20601.

| MODE | NAME                         | GYRO        | ACCEL       |
|------|------------------------------|-------------|-------------|
| 1    | Sleep Mode                   | Off         | Off         |
| 2    | Standby Mode                 | Drive On    | Off         |
| 3    | Accelerometer Standard Mode  | Off         | Duty-Cycled |
| 4    | Accelerometer Low-Noise Mode | Off         | On          |
| 5    | Gyroscope Standard Mode      | Duty-Cycled | Off         |
| 6    | Gyroscope Low-Noise Mode     | On          | Off         |
| 7    | 6-Axis Low-Noise Mode        | On          | On          |
| 8    | 6-Axis Standard Mode         | Duty-Cycled | On          |

Table 12. Power Modes for ICM-20601

Page 25 of 51

## 5 PROGRAMMABLE INTERRUPTS

The ICM-20601 has a programmable interrupt system which can generate an interrupt signal on the INT pin. Status flags indicate the source of an interrupt. Interrupt sources may be enabled and disabled individually.

| INTERRUPT NAME   | MODULE           |
|------------------|------------------|
| Motion Detection | Motion           |
| FIFO Overflow    | FIFO             |
| Data Ready       | Sensor Registers |

Table 13. Table of Interrupt Sources

#### 5.1 WAKE-ON-MOTION INTERRUPT

The ICM-20601 provides motion detection capability. A qualifying motion sample is one where the high passed sample from any axis has an absolute value exceeding a user-programmable threshold. The following steps explain how to configure the Wake-on-Motion Interrupt.

#### Step 1: Ensure that Accelerometer is running

- In PWR\_MGMT\_1 register (0x6B) set CYCLE = 0, SLEEP = 0, and GYRO\_STANDBY = 0
- In PWR MGMT 2 register (0x6C) set STBY XA = STBY YA = STBY ZA = 0, and STBY XG = STBY YG = STBY ZG = 1

#### Step 2: Accelerometer Configuration

In ACCEL\_CONFIG2 register (0x1D) set ACCEL\_FCHOICE\_B = 0 and A\_DLPF\_CFG[2:0] = 1 (b001)

#### Step 3: Enable Motion Interrupt

In INT ENABLE register (0x38) set WOM INT EN = 111 to enable motion interrupt

## Step 4: Set Motion Threshold

Set the motion threshold in ACCEL\_WOM\_THR register (0x1F)

### Step 5: Enable Accelerometer Hardware Intelligence

• In ACCEL INTEL CTRL register (0x69) set ACCEL INTEL EN = ACCEL INTEL MODE = 1; Ensure that bit 0 is set to 0.

#### Step 6: Set Frequency of Wake-Up

• In Standard Mode Configuration register (0x1E) set LPOSC\_CLKSEL[3:0] for a sample rate as indicated in the register map

#### Step 7: Enable Cycle Mode (Accelerometer Standard Mode)

• In PWR MGMT 1 register (0x6B) set CYCLE = 1

## 6 DIGITAL INTERFACE

## 6.1 I<sup>2</sup>C AND SPI SERIAL INTERFACES

The internal registers and memory of the ICM-20601 can be accessed using either I<sup>2</sup>C at 400 kHz or SPI at 8 MHz. SPI operates in four-wire mode.

| PIN NUMBER | PIN NAME   | PIN DESCRIPTION  |
|------------|------------|--|
| 1          | VDDIO      | Digital I/O supply voltage.  |
| 4          | AD0 / SDO  | I <sup>2</sup> C Slave Address LSB (AD0); SPI serial data output (SDO) |
| 2          | SCL / SCLK | I <sup>2</sup> C serial clock (SCL); SPI serial clock (SCLK)           |
| 3          | SDA / SDI  | I <sup>2</sup> C serial data (SDA); SPI serial data input (SDI)        |

**Table 14. Serial Interface** 

**Note:** To prevent switching into  $I^2C$  mode when using SPI, the  $I^2C$  interface should be disabled by setting the  $I^2C_IF_DIS$  configuration bit. Setting this bit should be performed immediately after waiting for the time specified by the "Start-Up Time for Register Read/Write" in section 3.3.3.

### 6.2 I<sup>2</sup>C INTERFACE

 $I^2C$  is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bidirectional. In a generalized  $I^2C$  interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The ICM-20601 always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDD. The maximum bus speed is 400 kHz.

The slave address of the ICM-20601 is b110100X which is 7 bits long. The LSB bit of the 7-bit address is determined by the logic level on pin AD0. This allows two ICM-20601s to be connected to the same I<sup>2</sup>C bus. When used in this configuration, the address of one of the devices should be b1101000 (pin AD0 is logic low) and the address of the other should be b1101001 (pin AD0 is logic high).

## 6.3 I<sup>2</sup>C COMMUNICATIONS PROTOCOL

#### START (S) and STOP (P) Conditions

Communication on the I<sup>2</sup>C bus starts when the master puts the START condition (S) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition (P) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see figure below).

Additionally, the bus remains busy if a repeated START (Sr) is generated instead of a STOP condition.

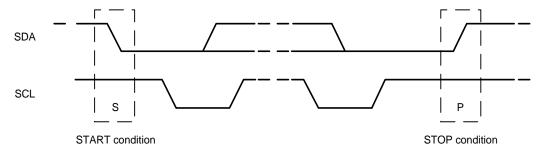

Figure 9. START and STOP Conditions

## Data Format / Acknowledge

I<sup>2</sup>C data bytes are defined to be 8 bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.

If a slave is busy and cannot transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready, and releases the clock line (refer to the following figure).

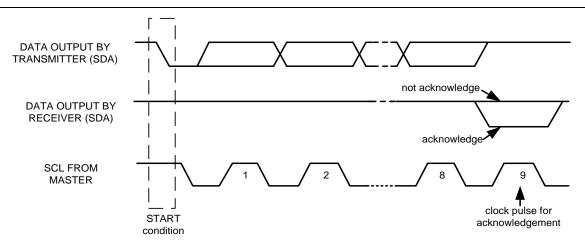

Figure 10. Acknowledge on the I2C Bus

#### **Communications**

After beginning communications with the START condition (S), the master sends a 7-bit slave address followed by an 8<sup>th</sup> bit, the read/write bit. The read/write bit indicates whether the master is receiving data from or is writing to the slave device. Then, the master releases the SDA line and waits for the acknowledge signal (ACK) from the slave device. Each byte transferred must be followed by an acknowledge bit. To acknowledge, the slave device pulls the SDA line LOW and keeps it LOW for the high period of the SCL line. Data transmission is always terminated by the master with a STOP condition (P), thus freeing the communications line. However, the master can generate a repeated START condition (Sr), and address another slave without first generating a STOP condition (P). A LOW to HIGH transition on the SDA line while SCL is HIGH defines the stop condition. All SDA changes should take place when SCL is low, with the exception of start and stop conditions.

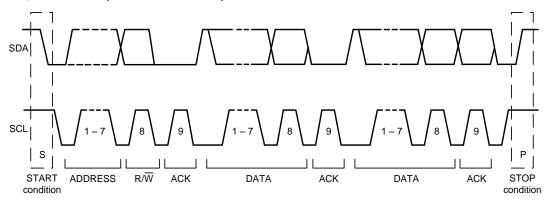

Figure 11. Complete I<sup>2</sup>C Data Transfer

To write the internal ICM-20601 registers, the master transmits the start condition (S), followed by the I<sup>2</sup>C address and the write bit (0). At the 9<sup>th</sup> clock cycle (when the clock is high), the ICM-20601 acknowledges the transfer. Then the master puts the register address (RA) on the bus. After the ICM-20601 acknowledges the reception of the register address, the master puts the register data onto the bus. This is followed by the ACK signal, and data transfer may be concluded by the stop condition (P). To write multiple bytes after the last ACK signal, the master can continue outputting data rather than transmitting a stop signal. In this case, the ICM-20601 automatically increments the register address and loads the data to the appropriate register. The following figures show single and two-byte write sequences.

Single-Byte Write Sequence

| Master | S | AD+W |     | RA |     | DATA |     | Р |
|--------|---|------|-----|----|-----|------|-----|---|
| Slave  |   |      | ACK |    | ACK |      | ACK |   |

Burst Write Sequence

| Master | S | AD+W |     | RA |     | DATA |     | DATA |     | Р |
|--------|---|------|-----|----|-----|------|-----|------|-----|---|
| Slave  |   |      | ACK |    | ACK |      | ACK |      | ACK |   |

Document Number: DS-000191 Page 28 of 51

To read the internal ICM-20601 registers, the master sends a start condition, followed by the I<sup>2</sup>C address and a write bit, and then the register address that is going to be read. Upon receiving the ACK signal from the ICM-20601, the master transmits a start signal followed by the slave address and read bit. As a result, the ICM-20601 sends an ACK signal and the data. The communication ends with a not acknowledge (NACK) signal and a stop bit from master. The NACK condition is defined such that the SDA line remains high at the 9<sup>th</sup> clock cycle. The following figures show single and two-byte read sequences.

#### Single-Byte Read Sequence

| Master | S | AD+W |     | RA |     | S | AD+R |     |      | NACK | Р |
|--------|---|------|-----|----|-----|---|------|-----|------|------|---|
| Slave  |   |      | ACK |    | ACK |   |      | ACK | DATA |      |   |

### Burst Read Sequence

| Master | S | AD+W |     | RA |     | S | AD+R |     |      | ACK |      | NACK | Р |
|--------|---|------|-----|----|-----|---|------|-----|------|-----|------|------|---|
| Slave  |   |      | ACK |    | ACK |   |      | ACK | DATA |     | DATA |      |   |

## 6.4 I<sup>2</sup>C TERMS

| SIGNAL | DESCRIPTION  |
|--------|--|
| S      | Start Condition: SDA goes from high to low while SCL is high                   |
| AD     | Slave I <sup>2</sup> C address   |
| W      | Write bit (0)  |
| R      | Read bit (1)   |
| ACK    | Acknowledge: SDA line is low while the SCL line is high at the 9th clock cycle |
| NACK   | Not-Acknowledge: SDA line stays high at the 9 <sup>th</sup> clock cycle        |
| RA     | ICM-20601 internal register address  |
| DATA   | Transmit or received data  |
| Р      | Stop condition: SDA going from low to high while SCL is high                   |

Table 15. I<sup>2</sup>C Terms

## 6.5 SPI INTERFACE

SPI is a 4-wire synchronous serial interface that uses two control lines and two data lines. The ICM-20601 always operates as a Slave device during standard Master-Slave SPI operation.

With respect to the Master, the Serial Clock output (SCLK), the Serial Data Output (SDO) and the Serial Data Input (SDI) are shared among the Slave devices. Each SPI slave device requires its own Chip Select (CS) line from the master.

CS goes low (active) at the start of transmission and goes back high (inactive) at the end. Only one CS line is active at a time, ensuring that only one slave is selected at any given time. The CS lines of the non-selected slave devices are held high, causing their SDO lines to remain in a high-impedance (high-z) state so that they do not interfere with any active devices.

#### SPI Operational Features

- 1. Data is delivered MSB first and LSB last
- 2. Data is latched on the rising edge of SCLK
- 3. Data should be transitioned on the falling edge of SCLK
- 4. The maximum frequency of SCLK is 8MHz
- 5. SPI read and write operations are completed in 16 or more clock cycles (two or more bytes). The first byte contains the SPI Address, and the following byte(s) contain(s) the SPI data. The first bit of the first byte contains the Read/Write bit and indicates the Read (1) or Write (0) operation. The following 7 bits contain the Register Address. In cases of multiple-byte Read/Writes, data is two or more bytes:

SPI Address format

| MSB |    |    |    |    |    |    | LSB |
|-----|----|----|----|----|----|----|-----|
| R/W | A6 | A5 | A4 | А3 | A2 | A1 | Α0  |

Page 29 of 51

## SPI Data format

| MSB |    |    |    |    |    |    | LSB |
|-----|----|----|----|----|----|----|-----|
| D7  | D6 | D5 | D4 | D3 | D2 | D1 | D0  |

Note: Register Names ending in \_H and \_L contain the high and low bytes, respectively, of an internal register value.

In the detailed register tables that follow, register names are in capital letters, while register values are in capital letters and italicized. For example, the ACCEL\_XOUT\_H register (Register 59) contains the 8 most significant bits, ACCEL\_XOUT[15:8], of the 16-bit X-Axis accelerometer measurement, ACCEL\_XOUT.

The reset value is 0x00 for all registers other than the registers below, also the self-test registers contain pre-programmed values and will not be 0x00 after reset.

- Register 107 (0x40) Power Management 1
- Register 117 (0xAC) WHO\_AM\_I

Document Number: DS-000191 Revision: 1.0

## REGISTER DESCRIPTIONS

This section describes the function and contents of each register within the ICM-20601.

Note: The device will come up in sleep mode upon power-up.

#### 8.1 REGISTERS 0 TO 2 – GYROSCOPE SELF-TEST REGISTERS

Register Name: SELF\_TEST\_X\_GYRO, SELF\_TEST\_Y\_GYRO, SELF\_TEST\_Z\_GYRO

Type: READ/WRITE

Register Address: 00, 01, 02 (Decimal); 00, 01, 02 (Hex)

| REGISTER         | BIT   | NAME            | FUNCTION   |
|------------------|-------|-----------------|--|
|                  |       |                 | The value in this register indicates the self-test output generated during |
| SELF_TEST_X_GYRO | [7:0] | XG_ST_DATA[7:0] | manufacturing tests. This value is to be used to check against             |
|                  |       |                 | subsequent self-test outputs performed by the end user.                    |
|                  |       |                 | The value in this register indicates the self-test output generated during |
| SELF_TEST_Y_GYRO | [7:0] | YG_ST_DATA[7:0] | manufacturing tests. This value is to be used to check against             |
|                  |       |                 | subsequent self-test outputs performed by the end user.                    |
|                  |       |                 | The value in this register indicates the self-test output generated during |
| SELF_TEST_Z_GYRO | [7:0] | ZG_ST_DATA[7:0] | manufacturing tests. This value is to be used to check against             |
|                  |       |                 | subsequent self-test outputs performed by the end user.                    |

The equation to convert self-test codes in OTP to factory self-test measurement is:

$$ST_OTP = (2620/2^{FS}) * 1.01^{(ST_code-1)}$$
 (lsb)

where ST\_OTP is the value that is stored in OTP of the device, FS is the Full Scale value, and ST\_code is based on the Self-Test value (ST\_FAC) determined in InvenSense's factory final test and calculated based on the following equation:

$$ST\_code = round(\frac{\log(ST\_FAC/(2620/2^{FS}))}{\log(1.01)}) + 1$$

#### 8.2 **REGISTERS 13 TO 15 – ACCELEROMETER SELF-TEST REGISTERS**

Register Name: SELF\_TEST\_X\_ACCEL, SELF\_TEST\_Y\_ACCEL, SELF\_TEST\_Z\_ACCEL

Type: READ/WRITE

Register Address: 13, 14, 15 (Decimal); 0D, 0E, 0F (Hex)

| REGISTER          | BITS  | NAME            | FUNCTION  |
|-------------------|-------|-----------------|---|
|                   |       |                 | The value in this register indicates the self-test output generated   |
| SELF_TEST_X_ACCEL | [7:0] | XA_ST_DATA[7:0] | during manufacturing tests. This value is to be used to check against |
|                   |       |                 | subsequent self-test outputs performed by the end user.               |
|                   |       |                 | The value in this register indicates the self-test output generated   |
| SELF_TEST_Y_ACCEL | [7:0] | YA_ST_DATA[7:0] | during manufacturing tests. This value is to be used to check against |
|                   |       |                 | subsequent self-test outputs performed by the end user.               |
|                   |       |                 | The value in this register indicates the self-test output generated   |
| SELF_TEST_Z_ACCEL | [7:0] | ZA_ST_DATA[7:0] | during manufacturing tests. This value is to be used to check against |
|                   |       |                 | subsequent self-test outputs performed by the end user.               |

The equation to convert self-test codes in OTP to factory self-test measurement is:

$$ST_OTP = (2620/2^{FS}) * 1.01^{(ST_coode-1)}$$
 (lsb)

where ST OTP is the value that is stored in OTP of the device, FS is the Full Scale value, and ST code is based on the Self-Test value (ST\_FAC) determined in InvenSense's factory final test and calculated based on the following equation:

$$ST\_code = round(\frac{\log(ST\_FAC/(2620/2^{FS}))}{\log(1.01)}) + 1$$

## 8.3 REGISTERS 19 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: XG\_OFFS\_USRH Register Type: READ/WRITE

Register Address: 19 (Decimal); 13 (Hex)

| BIT   | NAME             | FUNCTION  |
|-------|------------------|---|
| [7.0] | V OFFC HCD[4F.0] | Bits 15 to 8 of the 16-bit offset of X gyroscope (2's complement). This register is |
| [7:0] | X_OFFS_USR[15:8] | used to remove DC bias from the sensor output. The value in this register is        |
|       |                  | added to the gyroscope sensor value before going into the sensor register.          |

### 8.4 REGISTERS 20 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: XG\_OFFS\_USRL Register Type: READ/WRITE

Register Address: 20 (Decimal); 14 (Hex)

| BIT   | NAME            | FUNCTION   |
|-------|-----------------|--|
|       |                 | Bits 7 to 0 of the 16-bit offset of X gyroscope (2's complement). This register is |
| [7:0] | X_OFFS_USR[7:0] | used to remove DC bias from the sensor output. The value in this register is       |
|       |                 | added to the gyroscope sensor value before going into the sensor register.         |

#### 8.5 REGISTERS 21 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: YG\_OFFS\_USRH Register Type: READ/WRITE

Register Address: 21 (Decimal); 15 (Hex)

| BIT   | NAME             | FUNCTION  |
|-------|------------------|---|
|       |                  | Bits 15 to 8 of the 16-bit offset of Y gyroscope (2's complement). This register is |
| [7:0] | Y_OFFS_USR[15:8] | used to remove DC bias from the sensor output. The value in this register is        |
|       |                  | added to the gyroscope sensor value before going into the sensor register.          |

## 8.6 REGISTERS 22 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: YG\_OFFS\_USRL Register Type: READ/WRITE

Register Address: 22 (Decimal); 16 (Hex)

| BIT   | NAME            | FUNCTION   |  |
|-------|-----------------|--|--|
| [7:0] | Y_OFFS_USR[7:0] | Bits 7 to 0 of the 16-bit offset of Y gyroscope (2's complement). This register is |  |
|       |                 | used to remove DC bias from the sensor output. The value in this register is       |  |
|       |                 | added to the gyroscope sensor value before going into the sensor register.         |  |

## 8.7 REGISTERS 23 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: ZG\_OFFS\_USRH Register Type: READ/WRITE

Register Address: 23 (Decimal); 17 (Hex)

| BIT   | NAME             | FUNCTION  |  |
|-------|------------------|---|--|
|       |                  | Bits 15 to 8 of the 16-bit offset of Z gyroscope (2's complement). This register is |  |
| [7:0] | Z_OFFS_USR[15:8] | used to remove DC bias from the sensor output. The value in this register is        |  |
|       |                  | added to the gyroscope sensor value before going into the sensor register.          |  |

Document Number: DS-000191

Page 34 of 51

## 8.8 REGISTER 24 – GYRO OFFSET ADJUSTMENT REGISTER

Register Name: ZG\_OFFS\_USRL Register Type: READ/WRITE

Register Address: 24 (Decimal); 18 (Hex)

| BIT   | NAME            | FUNCTION   |  |  |
|-------|-----------------|--|--|--|
|       | Z_OFFS_USR[7:0] | Bits 7 to 0 of the 16-bit offset of Z gyroscope (2's complement). This register is |  |  |
| [7:0] |                 | used to remove DC bias from the sensor output. The value in this register is       |  |  |
|       |                 | added to the gyroscope sensor value before going into the sensor register.         |  |  |

## 8.9 REGISTER 25 – SAMPLE RATE DIVIDER

Register Name: SMPLRT\_DIV Register Type: READ/WRITE

Register Address: 25 (Decimal); 19 (Hex)

| BIT   | NAME            | FUNCTION   |
|-------|-----------------|--|
| [7:0] | SMPLRT_DIV[7:0] | Divides the internal sample rate (see register CONFIG) to generate the sample rate that        |
|       |                 | controls sensor data output rate, FIFO sample rate. NOTE: This register is only effective when |
|       |                 | FCHOICE_B register bits are 2'b00, and (0 < DLPF_CFG < 7).                                     |
|       |                 | This is the update rate of the sensor register:  |
|       |                 | SAMPLE_RATE = INTERNAL_SAMPLE_RATE / (1 + SMPLRT_DIV)  |
|       |                 | Where INTERNAL_SAMPLE_RATE = 1 kHz   |

## 8.10 REGISTER 26 - CONFIGURATION

Register Name: CONFIG Register Type: READ/WRITE

Register Address: 26 (Decimal); 1A (Hex)

| BIT   | NAME              | FUNCTION   | FUNCTION   |                    |                   |  |
|-------|-------------------|--|--|--------------------|-------------------|--|
| [7]   | -                 | Always set to 0  | Always set to 0  |                    |                   |  |
| [6]   | FIFO MODE         | When set to '1', when  | When set to '1', when the FIFO is full, additional writes will not be written to FIFO. |                    |                   |  |
|       | _                 | When set to '0', when the FIFO is full, additional writes will be written to the FII         |  |                    | e FIFO, replacing |  |
|       |                   | the oldest data.   | the oldest data.   |                    |                   |  |
| [5:3] | EXT_SYNC_SET[2:0] | Enables the FSYNC pi   | n data to be sampled.  |                    |                   |  |
|       |                   |  | EXT_SYNC_SET   | FSYNC bit location |                   |  |
|       |                   |  | 0  | function disabled  |                   |  |
|       |                   |  | 1  | TEMP_OUT_L[0]      |                   |  |
|       |                   |  | 2  | GYRO_XOUT_L[0]     |                   |  |
|       |                   |  | 3  | GYRO_YOUT_L[0]     |                   |  |
|       |                   |  | 4  | GYRO_ZOUT_L[0]     |                   |  |
|       |                   |  | 5  | ACCEL_XOUT_L[0]    |                   |  |
|       |                   |  | 6  | ACCEL_YOUT_L[0]    |                   |  |
|       |                   |  | 7  | ACCEL_ZOUT_L[0]    |                   |  |
|       |                   | FSYNC will be latched to capture short strobes. This will be done such that if FSYNC toggl   |  |                    |                   |  |
|       |                   | the latched value toggles, but won't toggle again until the new latched value is captured by |  |                    |                   |  |
|       |                   | the sample rate strobe.  |  |                    |                   |  |
| [2:0] | DLPF_CFG[2:0]     | For the DLPF to be us  | ed, FCHOICE_B[1:0] is 2  | ′b00.              |                   |  |
|       |                   | See the table below.   |  |                    |                   |  |

The DLPF is configured by *DLPF\_CFG*, when *FCHOICE\_B* [1:0] = 2b'00. The gyroscope and temperature sensor are filtered according to the value of *DLPF\_CFG* and *FCHOICE\_B* as shown in the table below.

| FCHOICE_B |     | DIDE CEC | Gyroscope       |                  |               | Temperature<br>Sensor |
|-----------|-----|----------|-----------------|------------------|---------------|-----------------------|
| <1>       | <0> | DLPF_CFG | 3-dB BW<br>(Hz) | Noise BW<br>(Hz) | Rate<br>(kHz) | 3-dB BW (Hz)          |
| Х         | 1   | Х        | 8173            | 8595.1           | 32            | 4000                  |
| 1         | 0   | Х        | 3281            | 3451.0           | 32            | 4000                  |
| 0         | 0   | 0        | 250             | 306.6            | 8             | 4000                  |
| 0         | 0   | 1        | 176             | 177.0            | 1             | 188                   |
| 0         | 0   | 2        | 92              | 108.6            | 1             | 98                    |
| 0         | 0   | 3        | 41              | 59.0             | 1             | 42                    |

| 0         | 0   | 7        | 3281            | 3451.0           | 8             | 4000                  |

#### 8.11 REGISTER 27 – GYROSCOPE CONFIGURATION

Register Name: GYRO\_CONFIG Register Type: READ/WRITE

Register Address: 27 (Decimal); 1B (Hex)

| BIT   | NAME           | FUNCTION   |  |
|-------|----------------|--|--|
| [7]   | XG_ST          | X Gyro self-test   |  |
| [6]   | YG_ST          | Y Gyro self-test   |  |
| [5]   | ZG_ST          | Z Gyro self-test   |  |
| [4:3] | FS_SEL[1:0]    | Gyro Full Scale Select:<br>$00 = \pm 500 \text{ dps}$<br>$01 = \pm 1000 \text{ dps}$<br>$10 = \pm 2000 \text{ dps}$<br>$11 = \pm 4000 \text{ dps}$ |  |
| [2]   | -              | Reserved   |  |
| [1:0] | FCHOICE_B[1:0] | Used to bypass DLPF as shown in table 1 above.   |  |

## 8.12 REGISTER 28 – ACCELEROMETER CONFIGURATION

Register Name: ACCEL\_CONFIG Register Type: READ/WRITE

Register Address: 28 (Decimal); 1C (Hex)

| BIT   | NAME              | FUNCTION   |  |  |
|-------|-------------------|--|--|--|
| [7]   | XA_ST             | X Accel self-test  |  |  |
| [6]   | YA_ST             | Y Accel self-test  |  |  |
| [5]   | ZA_ST             | Z Accel self-test  |  |  |
| [4:3] | ACCEL_FS_SEL[1:0] | Accel Full Scale Select:<br>±4g (00), ±8g (01), ±16g (10), ±32g (11) |  |  |
| [2:0] | -                 | Reserved   |  |  |

#### 8.13 REGISTER 29 – ACCELEROMETER CONFIGURATION 2

Register Name: ACCEL\_CONFIG2
Register Type: READ/WRITE

Register Address: 29 (Decimal); 1D (Hex)

| BIT   | NAME            | FUNCTION   |
|-------|-----------------|--|
| [7:6] | -               | Reserved   |
|       |                 | Averaging filter settings for Low Power Accelerometer mode:      |
|       |                 | 0 = Average 4 samples  |
| [5:4] | DEC2_CFG[1:0]   | 1 = Average 8 samples  |
|       |                 | 2 = Average 16 samples   |
|       |                 | 3 = Average 32 samples   |
| [3]   | ACCEL_FCHOICE_B | Used to bypass DLPF as shown in the table below.                 |
| [2:0] | A_DLPF_CFG      | Accelerometer low pass filter setting as shown in table 2 below. |

## Accelerometer Data Rates and Bandwidths (Low-Noise Mode)

|                 |            | A               | Accelerometer    |               |
|-----------------|------------|-----------------|------------------|---------------|
| ACCEL_FCHOICE_B | A_DLPF_CFG | 3-dB BW<br>(Hz) | Noise BW<br>(Hz) | Rate<br>(kHz) |
| 1               | Х          | 1046.0          | 1100.0           | 4             |
| 0               | 0          | 218.1           | 235.0            | 1             |
| 0               | 1          | 218.1           | 235.0            | 1             |
| 0               | 2          | 99.0            | 121.3            | 1             |
| 0               | 3          | 44.8            | 61.5             | 1             |
| 0               | 4          | 21.2            | 31.0             | 1             |
| 0               | 5          | 10.2            | 15.5             | 1             |
| 0               | 6          | 5.1             | 7.8              | 1             |
| 0               | 7          | 420.0           | 441.6            | 1             |

The data output rate of the DLPF filter block can be further reduced by a factor of 1/(1+SMPLRT\_DIV), where SMPLRT\_DIV is an 8-bit integer. Following is a small subset of ODRs that are configurable for the accelerometer in the low-noise mode in this manner (Hz): 3.91, 7.81, 15.63, 31.25, 62.50, 125, 250, 500, 1K

#### 8.14 REGISTER 30 – LOW POWER MODE CONFIGURATION

Register Name: LP\_MODE\_CFG Register Type: READ/WRITE

Register Address: 30 (Decimal); 1E (Hex)

| BIT   | NAME          | FUNCTION  | FUNCTION  |                       |                 |  |  |

|       |               |   | 8   | 62.50                 |                 |  |  |
|       |               |   | 9   | 125                   |                 |  |  |
|       |               |   | 10  | 250                   |                 |  |  |
|       |               |   | 11  | 500                   |                 |  |  |
|       |               |   | 12-15   | Reserved              |                 |  |  |

To operate in gyroscope low-power mode or 6-axis low-power mode, GYRO\_CYCLE should be set to '1.' Gyroscope filter configuration is determined by G\_AVGCFG[2:0] that sets the averaging filter configuration. It is not dependent on DLPF\_CFG[2:0].

The following table shows some example configurations for gyroscope low power mode.

| FCHOICE    | _B       | 0     | 0     | 0         | 0         | 0     | 0     | 0      | 0     |
|------------|----------|-------|-------|-----------|-----------|-------|-------|--------|-------|
| G_AVGCFG   |          | 0     | 1     | 2         | 3         | 4     | 5     | 6      | 7     |
| Averages   |          | 1x    | 2x    | 4x        | 8x        | 16x   | 32x   | 64x    | 128x  |
| Ton (m     | s)       | 1.73  | 2.23  | 3.23      | 5.23      | 9.23  | 17.23 | 33.23  | 65.23 |
| Noise BW   | (Hz)     | 650.8 | 407.1 | 224.2     | 117.4     | 60.2  | 30.6  | 15.6   | 8.0   |
| 3-dB BW    | (Hz)     | 622   | 391   | 211       | 108       | 54    | 27    | 14     | 7     |

# 8.15 REGISTER 31 – WAKE-ON MOTION THRESHOLD (ACCELEROMETER)

Register Name: ACCEL\_WOM\_THR

Register Type: READ/WRITE

Register Address: 31 (Decimal); 1F (Hex)

| BIT   | NAME         | FUNCTION  |
|-------|--------------|---|
| [7:0] | WOM_THR[7:0] | This register holds the threshold value for the Wake on Motion Interrupt for accelerometer. |

#### 8.16 REGISTER 35 - FIFO ENABLE

Register Name: FIFO\_EN
Register Type: READ/WRITE

Register Address: 35 (Decimal); 23 (Hex)

| BIT   | NAME          | FUNCTION  |
|-------|---------------|---|
|       |               | 1 – Write TEMP_OUT_H and TEMP_OUT_L to the FIFO at the sample rate; If enabled,                         |
| [7]   | TEMP_FIFO_EN  | buffering of data occurs even if data path is in standby.   |
|       |               | 0 – function is disabled  |
|       |               | 1 – Write GYRO_XOUT_H and GYRO_XOUT_L to the FIFO at the sample rate; If enabled,                       |
| [6]   | XG_FIFO_EN    | buffering of data occurs even if data path is in standby.   |
|       |               | 0 – function is disabled  |
|       |               | 1 – Write GYRO_YOUT_H and GYRO_YOUT_L to the FIFO at the sample rate; If enabled,                       |
|       | YG_FIFO_EN    | buffering of data occurs even if data path is in standby.   |
| [5]   |               | 0 – function is disabled  |
|       |               | NOTE: Enabling any one of the bits corresponding to the Gyros or Temp data paths, data is buffered into |
|       |               | the FIFO even though that data path is not enabled.   |
|       |               | 1 – Write GYRO_ZOUT_H and GYRO_ZOUT_L to the FIFO at the sample rate; If enabled,                       |
| [4]   | ZG_FIFO_EN    | buffering of data occurs even if data path is in standby.   |
|       |               | 0 – function is disabled  |
|       |               | 1 – write ACCEL_XOUT_H, ACCEL_XOUT_L, ACCEL_YOUT_H, ACCEL_YOUT_L, ACCEL_ZOUT_H,                         |
| [3]   | ACCEL_FIFO_EN | and ACCEL_ZOUT_L to the FIFO at the sample rate;  |
|       |               | 0 – function is disabled  |
| [2:0] | -             | Reserved  |

#### 8.17 REGISTER 54 – FSYNC INTERRUPT STATUS

Register Name: FSYNC\_INT Register Type: READ to CLEAR

Register Address: 54 (Decimal); 36 (Hex)

| BIT           | NAME       | FUNCTION  |
|---------------|------------|---|
| [7] FSYNC_INT | ESVNC INT  | This bit automatically sets to 1 when a FSYNC interrupt has been generated. The bit |
|               | FSTINC_INT | clears to 0 after the register has been read.                                       |

# 8.18 REGISTER 55 - INT/DRDY PIN / BYPASS ENABLE CONFIGURATION

Register Name: INT\_PIN\_CFG Register Type: READ/WRITE

Register Address: 55 (Decimal); 37 (Hex)

| BIT | NAME              | FUNCTION   |
|-----|-------------------|--|
| [7] | INT LEVEL         | 1 – The logic level for INT/DRDY pin is active low.                                      |
| [/] | 1111              | 0 – The logic level for INT/DRDY pin is active high.                                     |
| [6] | INT OPEN          | 1 – INT/DRDY pin is configured as open drain.  |
| [O] | INI_OFLIN         | 0 – INT/DRDY pin is configured as push-pull.   |
| (e) | LATCH INT EN      | 1 – INT/DRDY pin level held until interrupt status is cleared.                           |
| [5] | LATCH_INT_EN      | 0 – INT/DRDY pin indicates interrupt pulse's width is 50us.                              |
| [4] | INT_RD_CLEAR      | 1 – Interrupt status is cleared if any read operation is performed.                      |
| [4] |                   | 0 – Interrupt status is cleared only by reading INT_STATUS register                      |
| [2] | FSYNC_INT_LEVEL   | 1 – The logic level for the FSYNC pin as an interrupt is active low.                     |
| [3] |                   | 0 – The logic level for the FSYNC pin as an interrupt is active high.                    |
|     |                   | When this bit is equal to 1, the FSYNC pin will trigger an interrupt when it transitions |
| [2] | FSYNC_INT_MODE_EN | to the level specified by FSYNC_INT_LEVEL. When this bit is equal to 0, the FSYNC        |
|     |                   | pin is disabled from causing an interrupt.   |
| [1] | -                 | Reserved   |
| [0] | -                 | Always set to 0  |

## 8.19 REGISTER 56 - INTERRUPT ENABLE

Register Name: INT\_ENABLE Register Type: READ/WRITE

Register Address: 56 (Decimal); 38 (Hex)

| BIT   | NAME            | FUNCTION   |
|-------|-----------------|--|
| [7:5] | WOM_INT_EN[7:5] | 111 – Enable WoM interrupt on accelerometer.<br>000 – Disable WoM interrupt on accelerometer.                    |
| [4]   | FIFO_OFLOW_EN   | <ul><li>1 – Enables a FIFO buffer overflow to generate an interrupt.</li><li>0 – Function is disabled.</li></ul> |
| [3]   | -               | Reserved   |
| [2]   | GDRIVE_INT_EN   | Gyroscope Drive System Ready interrupt enable  |
| [1]   | -               | Reserved   |
| [0]   | DATA_RDY_INT_EN | Data ready interrupt enable  |

#### 8.20 REGISTER 58 - INTERRUPT STATUS

Register Name: INT\_STATUS
Register Type: READ to CLEAR

Register Address: 58 (Decimal); 3A (Hex)

| BIT   | NAME           | FUNCTION  |
|-------|----------------|---|
| [7:5] | WOM INT        | Accelerometer WoM interrupt status. Cleared on Read.                                      |
| [7.5] | WOW_IN1        | 111 – WoM interrupt on accelerometer  |
| [4]   | FIFO_OFLOW_INT | This bit automatically sets to 1 when a FIFO buffer overflow has been generated. The bit  |
| [4]   |                | clears to 0 after the register has been read.   |
| [3]   | -              | Reserved.   |
| [2]   | GDRIVE_INT     | Gyroscope Drive System Ready interrupt  |
| [1]   | -              | Reserved.   |
| [0]   | DATA DOVINT    | This bit automatically sets to 1 when a Data Ready interrupt is generated. The bit clears |
|       | DATA_RDY_INT   | to 0 after the register has been read.  |

Document Number: DS-000191

Page 40 of 51

#### 8.21 REGISTERS 59 TO 64 – ACCELEROMETER MEASUREMENTS

Register Name: ACCEL\_XOUT\_H

Register Type: READ only

Register Address: 59 (Decimal); 3B (Hex)

| BIT   | NAME               | FUNCTION                                |
|-------|--------------------|---|
| [7:0] | ACCEL_XOUT_H[15:8] | High byte of accelerometer x-axis data. |

Register Name: ACCEL\_XOUT\_L Register Type: READ only

Register Address: 60 (Decimal); 3C (Hex)

| BIT   | NAME              | FUNCTION                               |
|-------|-------------------|--|
| [7:0] | ACCEL_XOUT_L[7:0] | Low byte of accelerometer x-axis data. |

Register Name: ACCEL\_YOUT\_H

Register Type: READ only

Register Address: 61 (Decimal); 3D (Hex)

| BIT   | NAME               | FUNCTION                                |
|-------|--------------------|---|
| [7:0] | ACCEL_YOUT_H[15:8] | High byte of accelerometer y-axis data. |

Register Name: ACCEL\_YOUT\_L Register Type: READ only

Register Address: 62 (Decimal); 3E (Hex)

| BIT   | NAME              | FUNCTION                               |
|-------|-------------------|--|
| [7:0] | ACCEL_YOUT_L[7:0] | Low byte of accelerometer y-axis data. |

Register Name: ACCEL\_ZOUT\_H
Register Type: READ only

Register Address: 63 (Decimal); 3F (Hex)

| BIT   | NAME               | FUNCTION                                |  |
|-------|--------------------|---|--|
| [7:0] | ACCEL_ZOUT_H[15:8] | High byte of accelerometer z-axis data. |  |

Register Name: ACCEL\_ZOUT\_L Register Type: READ only

Register Address: 64 (Decimal); 40 (Hex)

| BIT   | NAME              | FUNCTION                               |  |
|-------|-------------------|--|--|
| [7:0] | ACCEL ZOUT L[7:0] | Low byte of accelerometer z-axis data. |  |

### 8.22 REGISTERS 65 AND 66 - TEMPERATURE MEASUREMENT

Register Name: TEMP\_OUT\_H Register Type: READ only

Register Address: 65 (Decimal); 41 (Hex)

| BIT   | NAME           | FUNCTION                                   |  |
|-------|----------------|--|--|
| [7:0] | TEMP_OUT[15:8] | High byte of the temperature sensor output |  |

Register Name: TEMP\_OUT\_L Register Type: READ only

Register Address: 66 (Decimal); 42 (Hex)

| BIT   | NAME          | FUNCTION                                  |   |
|-------|---------------|---|---|
|       |               | Low byte of the temperature sensor output |   |
| [7:0] | TEMP_OUT[7:0] | TEMP_degC                                 | = ((TEMP_OUT –                              |
|       |               |   | RoomTemp Offset)/Temp Sensitivity) + 25degC |

#### 8.23 REGISTERS 67 TO 72 – GYROSCOPE MEASUREMENTS

Register Name: GYRO\_XOUT\_H Register Type: READ only

Register Address: 67 (Decimal); 43 (Hex)

| BIT   | NAME            | FUNCTION                                 |  |
|-------|-----------------|--|--|
| [7:0] | GYRO_XOUT[15:8] | High byte of the X-Axis gyroscope output |  |

Register Name: GYRO\_XOUT\_L Register Type: READ only

Register Address: 68 (Decimal); 44 (Hex)

| BIT   | NAME           | FUNCTION                                |                                   |
|-------|----------------|---|-----------------------------------|
| [7:0] | GYRO_XOUT[7:0] | Low byte of the X-Axis gyroscope output |                                   |
|       |                | GYRO_XOUT =                             | Gyro_Sensitivity * X_angular_rate |
|       |                | Nominal                                 | FS_SEL = 0                        |
|       |                | Conditions                              | Gyro_Sensitivity = 65.5 LSB/(dps) |

Register Name: GYRO\_YOUT\_H Register Type: READ only

Register Address: 69 (Decimal); 45 (Hex)

| BIT   | NAME            | FUNCTION                                 |  |
|-------|-----------------|--|--|
| [7:0] | GYRO_YOUT[15:8] | High byte of the Y-Axis gyroscope output |  |

Register Name: GYRO\_YOUT\_L Register Type: READ only

Register Address: 70 (Decimal); 46 (Hex)

| BIT   | NAME           | FUNCTION                                |                                   |
|-------|----------------|---|-----------------------------------|
|       | GYRO_YOUT[7:0] | Low byte of the Y-Axis gyroscope output |                                   |
| [7:0] |                | GYRO_YOUT =                             | Gyro_Sensitivity * Y_angular_rate |
| [7.0] |                | Nominal                                 | FS_SEL = 0                        |
|       |                | Conditions                              | Gyro_Sensitivity = 65.5 LSB/(dps) |

Register Name: GYRO\_ZOUT\_H Register Type: READ only

Register Address: 71 (Decimal); 47 (Hex)

| BIT   | NAME            | FUNCTION                                 |  |
|-------|-----------------|--|--|
| [7:0] | GYRO_ZOUT[15:8] | High byte of the Z-Axis gyroscope output |  |

Register Name: GYRO\_ZOUT\_L Register Type: READ only

Register Address: 72 (Decimal); 48 (Hex)

| BIT   | NAME           | FUNCTION                                |                                   |
|-------|----------------|---|-----------------------------------|
|       | GYRO_ZOUT[7:0] | Low byte of the Z-Axis gyroscope output |                                   |
| [7:0] |                | GYRO_ZOUT =                             | Gyro_Sensitivity * Z_angular_rate |
| [7.0] |                | Nominal                                 | FS_SEL = 0                        |
|       |                | Conditions                              | Gyro_Sensitivity = 65.5 LSB/(dps) |

#### 8.24 REGISTER 104 – SIGNAL PATH RESET

Register Name: SIGNAL\_PATH\_RESET

Register Type: READ/WRITE

Register Address: 104 (Decimal); 68 (Hex)

| BIT   | NAME      | FUNCTION   |
|-------|-----------|--|
| [7:2] | -         | Reserved   |
| [1]   | ACCEL_RST | Reset accel digital signal path. <b>NOTE</b> : Sensor registers are not cleared. Use SIG_COND_RST to clear sensor registers. |
| [0]   | TEMP_RST  | Reset temp digital signal path. <b>NOTE</b> : Sensor registers are not cleared. Use SIG_COND_RST to clear sensor registers.  |

#### 8.25 REGISTER 105 – ACCELEROMETER INTELLIGENCE CONTROL

Register Name: ACCEL\_INTEL\_CTRL

Register Type: READ/WRITE

Register Address: 105 (Decimal); 69 (Hex)

| BIT   | NAME              | FUNCTION  |
|-------|-------------------|---|
| [7]   | ACCEL_INTEL_EN    | This bit enables the Wake-on-Motion detection logic     |
| [6]   | ACCEL INTEL MODE  | 0 – Do not use  |
| [o]   | ACCEL_INTEL_WOODE | 1 – Compare the current sample with the previous sample |
| [5:0] | -                 | Reserved  |

#### 8.26 REGISTER 106 - USER CONTROL

Register Name: USER\_CTRL Register Type: READ/WRITE

Register Address: 106 (Decimal); 6A (Hex)

| BIT | NAME         | FUNCTION   |
|-----|--------------|--|
| [7] | -            | Reserved.  |
| [6] | FIFO_EN      | <ul> <li>1 – Enable FIFO operation mode.</li> <li>0 – Disable FIFO access from serial interface. To disable FIFO writes by DMA, use FIFO_EN register.</li> </ul> |
| [5] | -            | Reserved   |
| [4] | I2C_IF_DIS   | 1 – Disable I <sup>2</sup> C Slave module and put the serial interface in SPI mode only.   |
| [3] | -            | Reserved.  |
| [2] | FIFO_RST     | 1 – Reset FIFO module. Reset is asynchronous. This bit auto clears after one clock cycle of the internal 20 MHz clock.   |
| [1] | =            | Reserved   |
| [0] | SIG_COND_RST | 1 – Reset all gyro digital signal path, accel digital signal path, and temp digital signal path. This bit also clears all the sensor registers.                  |

#### 8.27 REGISTER 107 – POWER MANAGEMENT 1

Register Name: PWR\_MGMT\_1
Register Type: READ/WRITE

Register Address: 107 (Decimal); 6B (Hex)

| BIT   | NAME         | FUNCTION  |
|-------|--------------|---|
| [7]   | DEVICE_RESET | 1 – Reset the internal registers and restores the default settings. The bit automatically clears to 0 once the reset is done.   |
| [6]   | SLEEP        | When set to 1, the chip is set to sleep mode. <b>NOTE:</b> The default value is 1, the chip comes up in Sleep mode  |
| [5]   | ACCEL_CYCLE  | When set to 1, and SLEEP and STANDBY are not set to 1, the chip will cycle between sleep and taking a single accelerometer sample at a rate determined by SMPLRT_DIV NOTE: When all accelerometer axes are disabled via PWR_MGMT_2 register bits and cycle is enabled, the chip will wake up at the rate determined by the respective registers above, but will not take any samples.   |
| [4]   | GYRO_STANDBY | When set, the gyro drive and pll circuitry are enabled, but the sense paths are disabled. This is a low power mode that allows quick enabling of the gyros.   |
| [3]   | TEMP_DIS     | When set to 1, this bit disables the temperature sensor.  |
| [2:0] | CLKSEL[2:0]  | Code Clock Source  Internal 20 MHz oscillator  Auto selects the best available clock source – PLL if ready, else use the Internal oscillator  Auto selects the best available clock source – PLL if ready, else use the Internal oscillator  Auto selects the best available clock source – PLL if ready, else use the Internal oscillator  Auto selects the best available clock source – PLL if ready, else use the Internal oscillator  Auto selects the best available clock source – PLL if ready, else use the Internal oscillator  Internal 20 MHz oscillator  Stops the clock and keeps timing generator in reset |

NOTE: The default value of CLKSEL[2:0] is 000. It is required that CLKSEL[2:0] be set to 001 to achieve full gyroscope performance.

#### 8.28 REGISTER 108 – POWER MANAGEMENT 2

Register Name: PWR\_MGMT\_2 Register Type: READ/WRITE

Register Address: 108 (Decimal); 6C (Hex)

| BIT | NAME       | FUNCTION   |
|-----|------------|--|
| [7] | FIFO_LP_EN | 1 – Enable FIFO in low-power accelerometer mode. Default setting is 0. |
| [6] | =          | Reserved.  |
| [5] | STBY_XA    | 1 – X accelerometer is disabled<br>0 – X accelerometer is on           |
| [4] | STBY_YA    | 1 – Y accelerometer is disabled<br>0 – Y accelerometer is on           |
| [3] | STBY_ZA    | 1 – Z accelerometer is disabled<br>0 – Z accelerometer is on           |
| [2] | STBY_XG    | 1 – X gyro is disabled<br>0 – X gyro is on                             |
| [1] | STBY_YG    | 1 – Y gyro is disabled<br>0 – Y gyro is on                             |
| [0] | STBY_ZG    | 1 – Z gyro is disabled<br>0 – Z gyro is on                             |

#### 8.29 REGISTER 114 AND 115 – FIFO COUNT REGISTERS

Register Name: FIFO\_COUNTH Register Type: READ Only

Register Address: 114 (Decimal); 72 (Hex)

| BIT   | NAME             | FUNCTION  |
|-------|------------------|---|
| [7:5] | -                | Reserved  |
| [4.0] | FIFO COUNT[13:0] | High Bits, count indicates the number of written bytes in the FIFO.       |
| [4:0] | FIFO_COUNT[12:8] | Reading this byte latches the data for both FIFO_COUNTH, and FIFO_COUNTL. |

Register Name: FIFO\_COUNTL Register Type: READ Only

Register Address: 115 (Decimal); 73 (Hex)

| BIT   | NAME            | FUNCTION  |
|-------|-----------------|---|
| [7:0] | FIFO_COUNT[7:0] | Low Bits, count indicates the number of written bytes in the FIFO. <b>NOTE:</b> Must read FIFO_COUNTH to latch new data for both FIFO_COUNTH and FIFO_COUNTL. |

#### 8.30 REGISTER 116 – FIFO READ WRITE

Register Name: FIFO\_R\_W Register Type: READ/WRITE

Register Address: 116 (Decimal); 74 (Hex)

| BIT   | NAME           | FUNCTION  |
|-------|----------------|---|
| [7:0] | FIFO_DATA[7:0] | Read/Write command provides Read or Write operation for the FIFO. |

This register is used to read and write data from the FIFO buffer.

Data is written to the FIFO in order of register number (from lowest to highest). If all the FIFO enable flags (see below) are enabled, the contents of registers 59 through 72 will be written in order at the Sample Rate.

The contents of the sensor data registers (Registers 59 to 72) are written into the FIFO buffer when their corresponding FIFO enable flags are set to 1 in FIFO EN (Register 35).

If the FIFO buffer has overflowed, the status bit FIFO\_OFLOW\_INT is automatically set to 1. This bit is located in INT\_STATUS (Register 58). When the FIFO buffer has overflowed, the oldest data will be lost and new data will be written to the FIFO unless register 26 CONFIG, bit[6] FIFO\_MODE = 1.

If the FIFO buffer is empty, reading register FIFO\_DATA will return a unique value of 0xFF until new data is available. Normal data is precluded from ever indicating 0xFF, so 0xFF gives a trustworthy indication of FIFO empty.

#### 8.31 REGISTER 117 - WHO AM I

Register Name: WHO\_AM\_I Register Type: READ only

Register Address: 117 (Decimal); 75 (Hex)

| BIT   | NAME   | FUNCTION   |
|-------|--------|--|
| [7:0] | WHOAMI | Register to indicate to user which device is being accessed. |

This register is used to verify the identity of the device. The contents of *WHOAMI* is an 8-bit device ID. The default value of the register is 0xAC. This is different from the  $I^2C$  address of the device as seen on the slave  $I^2C$  controller by the applications processor. The  $I^2C$  address of the ICM-20601 is 0x68 or 0x69 depending upon the value driven on AD0 pin.

#### 8.32 REGISTERS 119, 120, 122, 123, 125, 126 ACCELEROMETER OFFSET REGISTERS

Register Name: XA\_OFFSET\_H Register Type: READ/WRITE

Register Address: 119 (Decimal); 77 (Hex)

| BIT   | NAME          | FUNCTION  |
|-------|---------------|---|
| [7:0] | XA OFFS[14:7] | Upper bits of the X accelerometer offset cancellation. ±16g Offset cancellation in all Full |
| [7.0] | XA_OFF3[14.7] | Scale modes, 15 bit 0.98-mg steps   |

Register Name: XA\_OFFSET\_L Register Type: READ/WRITE

Register Address: 120 (Decimal); 78 (Hex)

| BIT                | NAME  | FUNCTION                          |
|--------------------|---|-----------------------------------|
| [7:1] XA_OFFS[6:0] | Lower bits of the X accelerometer offset cancellation. ±16g Offset cancellation in all Full |                                   |
|                    | XA_OFF3[6.0]  | Scale modes, 15 bit 0.98-mg steps |
| [0]                | -   | Reserved                          |

Register Name: YA\_OFFSET\_H Register Type: READ/WRITE

Register Address: 122 (Decimal); 7A (Hex)

| BIT   | NAME          | FUNCTION  |
|-------|---------------|---|
| [7:0] | YA_OFFS[14:7] | Upper bits of the Y accelerometer offset cancellation. ±16g Offset cancellation in all Full |
|       |               | Scale modes, 15 bit 0.98-mg steps   |

Register Name: YA\_OFFSET\_L Register Type: READ/WRITE

Register Address: 123 (Decimal); 7B (Hex)

| BIT   | NAME         | FUNCTION  |
|-------|--------------|---|
| [7:1] | YA_OFFS[6:0] | Lower bits of the Y accelerometer offset cancellation. ±16g Offset cancellation in all Full Scale modes, 15 bit 0.98-mg steps |
| [0]   | -            | Reserved  |

Register Name: ZA\_OFFSET\_H Register Type: READ/WRITE

Register Address: 125 (Decimal); 7D (Hex)

| BIT   | NAME          | FUNCTION  |
|-------|---------------|---|
| [7:0] | ZA_OFFS[14:7] | Upper bits of the Z accelerometer offset cancellation. ±16g Offset cancellation in all Full Scale modes, 15 bit 0.98-mg steps |

Register Name: ZA\_OFFSET\_L Register Type: READ/WRITE

Register Address: 126 (Decimal); 7E (Hex)

| BIT   | NAME         | FUNCTION  |
|-------|--------------|---|
| [7:1] | ZA_OFFS[6:0] | Lower bits of the Z accelerometer offset cancellation. ±16g Offset cancellation in all Full Scale modes, 15 bit 0.98-mg steps |
| [0]   | -            | Reserved  |

# 9 ASSEMBLY

This section provides general guidelines for assembling InvenSense Micro Electro-Mechanical Systems (MEMS) gyros packaged in LGA package.

#### 9.1 ORIENTATION OF AXES

Figure 13 shows the orientation of the axes of sensitivity and the polarity of rotation. Note the pin 1 identifier (•) in the figure.

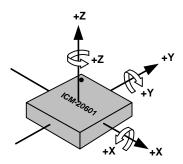

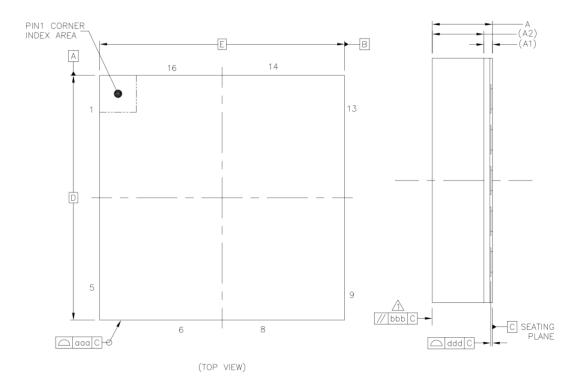

Figure 13. Orientation of Axes of Sensitivity and Polarity of Rotation

#### 9.2 PACKAGE DIMENSIONS

16 Lead LGA (3x3x0.75) mm NiAu pad finish

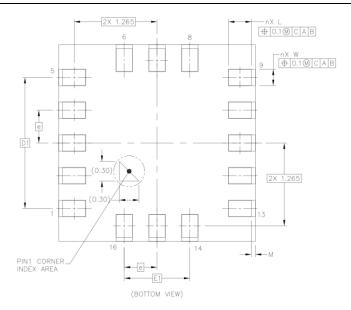

Figure 14. Package Dimensions

|                              |         | DIM  | DIMENSIONS IN MILLIMETERS |      |  |
