

### GENERAL DESCRIPTION

The ICS840001 is a Fibre Channel Clock Generator and a member of the HiPerClocks™ family of high performance devices from ICS. The ICS840001 uses a 26.5625MHz crystal to synthesize either 106.25MHz or 212.5MHz, using the FREQ\_SEL pin. The ICS840001 has excellent phase jitter performance, over the 637KHz – 10MHz integration range. The ICS840001 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS840001 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{DD}$ , and  $V_{DDA}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a  $10\Omega$  resistor along with a  $10\mu\text{F}$  and a  $.01\mu\text{F}$  bypass capacitor should be connected to each  $V_{DDA}$  pin.

FIGURE 1. POWER SUPPLY FILTERING

### CRYSTAL INPUT INTERFACE

The ICS840001 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 26.5625MHz, 18pF par-

allel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

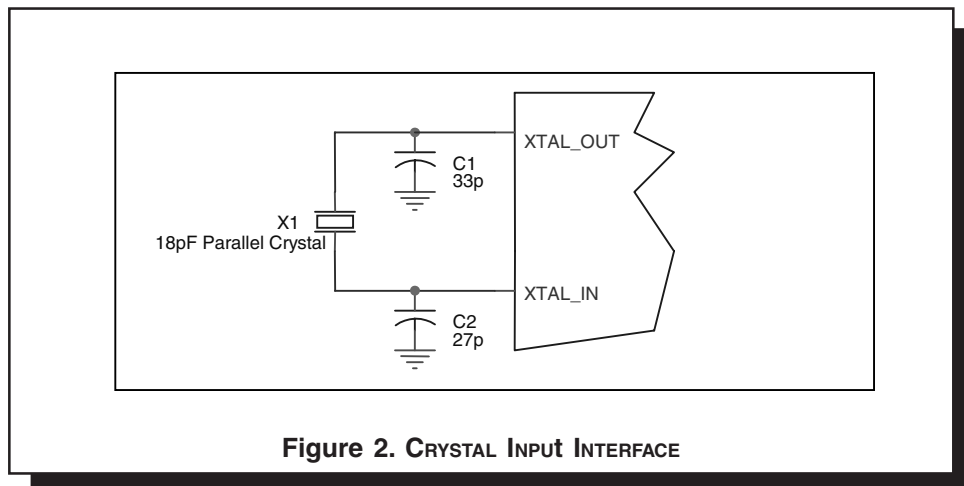

Figure 2. CRYSTAL INPUT INTERFACE

### LAYOUT GUIDELINE

Figure 3A shows a schematic example of the ICS840001. An example of LVCMOS termination is shown in this schematic. Additional LVCMOS termination approaches are shown in the LVCMOS Termination Application Note. In this example, an 18 pF parallel resonant 26.5625MHz crystal is used. The C1=27pF and C2=33pF are recommended for frequency accuracy. For

different board layout, the C1 and C2 may be slightly adjusted for optimizing frequency accuracy. The output frequency can be set at either 106.25MHz or 212.5MHz. Leaving the R1 un-installed (or install 1 KΩ pull-down) will set the output frequency at 106.25MHz. Installing the R1 pull up will set the output frequency at 212.5MHz.

### PC BOARD LAYOUT EXAMPLE

Figure 3B shows an example of P.C. board layout. The crystal X1 footprint in this example allows either surface mount (HC49S) or through hole (HC49) package. C3 is 0805. C1 and C2 are

0402. Other resistors and capacitors are 0603. This layout assumes that the board has clean analog power and ground planes.
