ICS844003I-01
FEMTOCLOCKS™ CRYSTAL-TO-LVDS
FREQUENCY SYNTHESIZER

GENERAL DESCRIPTION

The ICS844003I-01 is a 3 differential output LVDS Synthesizer designed to generate Ethernet reference clock frequencies and is a member of the HiPerClocks™ family of high performance clock solutions from ICS. Using a 19.53125MHz or 25MHz, 18pF parallel resonant crystal, the following frequencies can be generated based on the settings of 4 frequency select pins (DIV_SEL[A1:A0], DIV_SEL[B1:B0]): 625MHz, 312.5MHz, 156.25MHz, and 125MHz. The 844003I-01 has 2 output banks, Bank A with 1 differential LVDS output pair and Bank B with 2 differential LVDS output pairs.

The two banks have their own dedicated frequency select pins and can be independently set for the frequencies mentioned above. The ICS844003I-01 uses ICS' 3rd generation low phase noise VCO technology and can achieve 1ps or lower typical rms phase jitter, easily meeting Ethernet jitter requirements. The ICS844003I-01 is packaged in a small 24-pin TSSOP package.

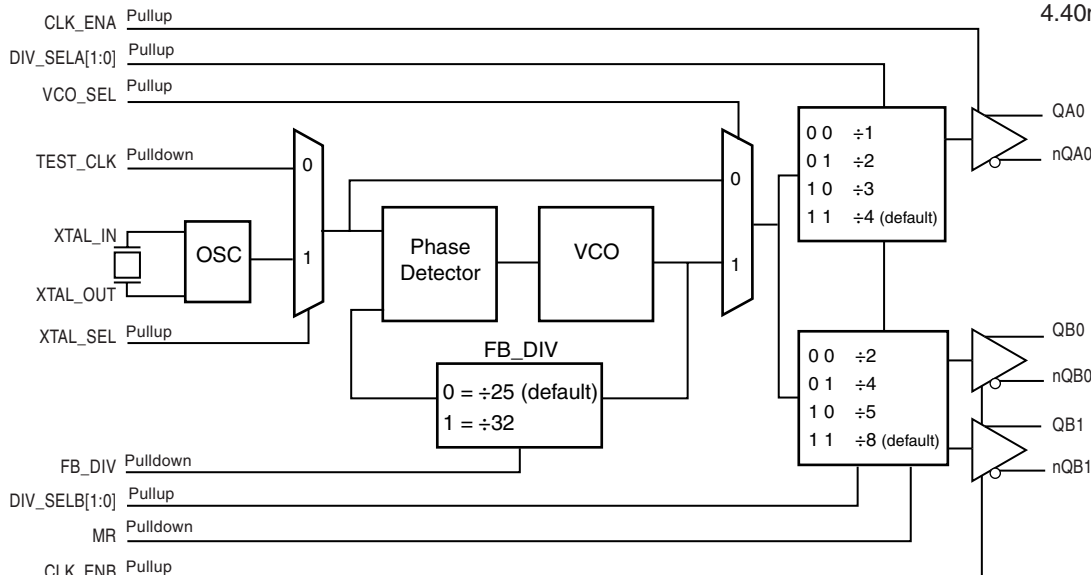

FEATURES

- Three LVDS outputs on two banks, A Bank with one LVDS pair and B Bank with 2 LVDS output pairs
- Using a 19.53125MHz or 25MHz crystal, the two output banks can be independently set for 625MHz, 312.5MHz, 156.25MHz or 125MHz
- Selectable crystal oscillator interface or LVCMOS/LVTTL single-ended input
- VCO range: 490MHz to 680MHz
- RMS phase jitter @ 156.25MHz (1.875MHz - 20MHz): 0.56ps (typical)
- 3.3V output supply mode
- -40°C to 85°C ambient operating temperature

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 24	DIV_SELB0, DIV_SELB1	Input	Pullup	Division select pin for Bank B. Default = HIGH. LVCMOS/LVTTL interface levels. See Table 3C.
2	VCO_SEL	Input	Pullup	VCO select pin. When Low, the PLL is bypassed and the crystal reference or TEST_CLK (depending on XTAL_SEL setting) are passed directly to the output dividers. Has an internal pullup resistor so the PLL is not bypassed by default. LVCMOS/LVTTL interface levels.
3	MR	Input	Pulldown	Active HIGH Master Reset. When logic HIGH, the internal dividers are reset causing the true outputs Qx to go low and the inverted outputs nQx to go high. When logic LOW, the internal dividers and the outputs are enabled. Has an internal pulldown resistor so the power-up default state of outputs and dividers are enabled. LVCMOS/LVTTL interface levels.
4	V _{DDO_A}	Power		Output supply pin for Bank A outputs.
5, 6	QA0, nQA0	Output		Differential output pair. LVDS interface levels.
7	CLK_ENB	Input	Pullup	Synchronizing clock enable for Bank B outputs. Active High output enable. When logic HIGH, the output pair in Bank B is enabled. When logic LOW, the QB outputs are LOW and nQB outputs are HIGH. Has an internal pullup resistor so the default power-up state of output is enabled. LVCMOS/LVTTL interface levels. See Figure 1.
8	CLK_ENA	Input	Pullup	Synchronizing clock enable for Bank A outputs. Active High output enable. When logic HIGH, the output pair in Bank A is enabled. When logic LOW, the QA output is LOW and nQA output is HIGH. Has an internal pullup resistor so the default power-up state of output is enabled. LVCMOS/LVTTL interface levels. See Figure 1.
9	FB_DIV	Input	Pulldown	Feedback divide select. When Low (default), the feedback divider is set for ÷25. When HIGH, the feedback divider is set for ÷32. LVCMOS/LVTTL interface levels. See Table 3D.
10	V _{DDA}	Power		Analog supply pin.
11	V _{DD}	Power		Core supply pin.
12, 13	DIV_SELA0, DIV_SELA1	Input	Pullup	Division select pin for Bank A. Default = HIGH. LVCMOS/LVTTL interface levels. See Table 3C.
14	GND	Power		Power supply ground.
15, 16	XTAL_OUT, XTAL_IN	Input		Parallel resonant crystal interface. XTAL_OUT is the output, XTAL_IN is the input. XTAL_IN is also the overdrive pin if you want to overdrive the crystal circuit with a single-ended reference clock.
17	TEST_CLK	Input	Pulldown	Single-ended reference clock input. Has an internal pulldown resistor to pull to low state by default. Can leave floating if using the crystal interface. LVCMOS/LVTTL interface levels.
18	XTAL_SEL	Input	Pullup	Crystal select pin. Selects between the single-ended TEST_CLK or crystal interface. Has an internal pullup resistor so the crystal interface is selected by default. LVCMOS/LVTTL interface levels.
19, 20	nQB1, QB1	Output		Differential output pair. LVDS interface levels.
21, 22	nQB0, QB0	Output		Differential output pair. LVDS interface levels.
23	V _{DDO_B}	Power		Output supply pin for Bank B outputs.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

TABLE 2. PIN CHARACTERISTICS

APPLICATION INFORMATION

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS844003I-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} , V_{DDA} , and V_{DDOX} should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 2* illustrates how a 10Ω resistor along with a $10\mu\text{F}$ and a $.01\mu\text{F}$ bypass capacitor should be connected to each V_{DDA} pin.

FIGURE 2. POWER SUPPLY FILTERING

CRYSTAL INPUT INTERFACE

The ICS844003I-01 has been characterized with 18pF parallel resonant crystals. The capacitor values shown in *Figure 3* below

were determined using a 19.53125MHz or 25MHz 18pF parallel resonant crystal and were chosen to minimize the ppm error.

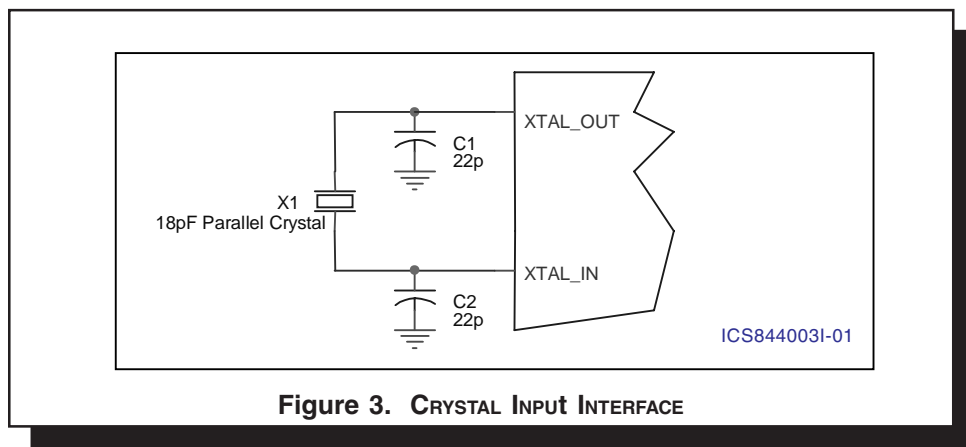

Figure 3. CRYSTAL INPUT INTERFACE

3.3V LVDS DRIVER TERMINATION

A general LVDS interface is shown in *Figure 4*. In a 100Ω differential transmission line environment, LVDS drivers require a matched load termination of 100Ω across near

the receiver input. For a multiple LVDS outputs buffer, if only partial outputs are used, it is recommended to terminate the unused outputs.

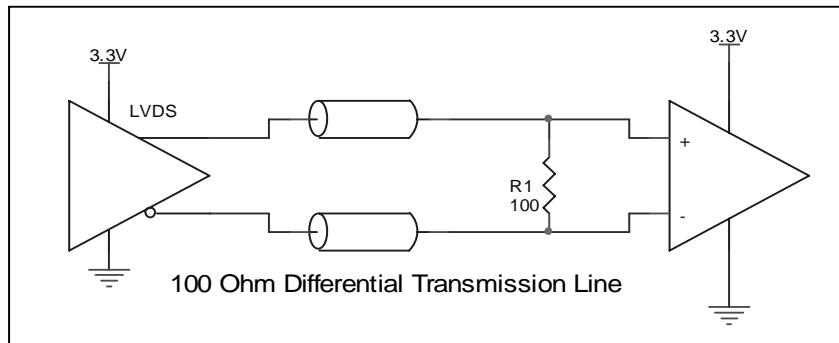

FIGURE 4. TYPICAL LVDS DRIVER TERMINATION
