

## GENERAL DESCRIPTION

The ICS853006 is a low skew, high performance 1-to-6 Differential-to-2.5V/3.3V LVPECL/ECL Fanout Buffer and a member of the HiPerClockSTM family of High Performance Clock Solutions from ICS. The ICS853006 is characterized to operate from a 2.5V or a 3.3V power supply. Guaranteed output and part-to-part skew characteristics make the ICS853006 ideal for those applications demanding well defined performance and repeatability.

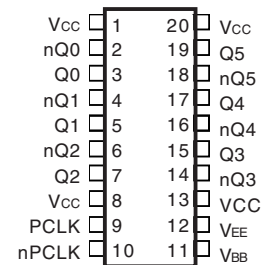

## FEATURES

- 6 differential LVPECL outputs
- 1 differential PCLK, nPCLK input pair
- PCLK, nPCLK pair can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Maximum output frequency: > 2GHz
- Output skew: 30ps (maximum)
- Part-to-part skew: 150ps (maximum)
- Propagation delay: 510ps (maximum)
- LVPECL mode operating voltage supply range:  $V_{CC} = 2.375V$  to  $3.465V$ ,  $V_{EE} = 0V$
- ECL mode operating voltage supply range:  $V_{CC} = 0V$ ,  $V_{EE} = -2.375V$  to  $-3.465V$
- $-40^{\circ}C$  to  $85^{\circ}C$  ambient operating temperature

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{CC}$	4.6V (LVPECL mode, $V_{EE} = 0$ )
Negative Supply Voltage, $V_{EE}$	-4.6V (ECL mode, $V_{CC} = 0$ )
Inputs, $V_I$ (LVPECL mode)	-0.5V to $V_{CC} + 0.5$ V
Inputs, $V_I$ (ECL mode)	0.5V to $V_{EE} - 0.5$ V
Outputs, $I_O$	
Continuous Current	50mA
Surge Current	100mA
$V_{BB}$ Sink/Source, $I_{BB}$	$\pm 0.5$ mA
Operating Temperature Range, $T_A$	-40°C to +85°C
Storage Temperature, $T_{STG}$	-65°C to 150°C
Package Thermal Impedance, $\theta_{JA}$ (Junction-to-Ambient)	73.2°C/W (0 Ifpm)

**NOTE:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

$t_R/t_F$	Output Rise/Fall Time 20% to 80%	95	150	205	95	150	205	95	150	205	ps

All parameters are measured  $\leq 1GHz$  unless otherwise noted.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

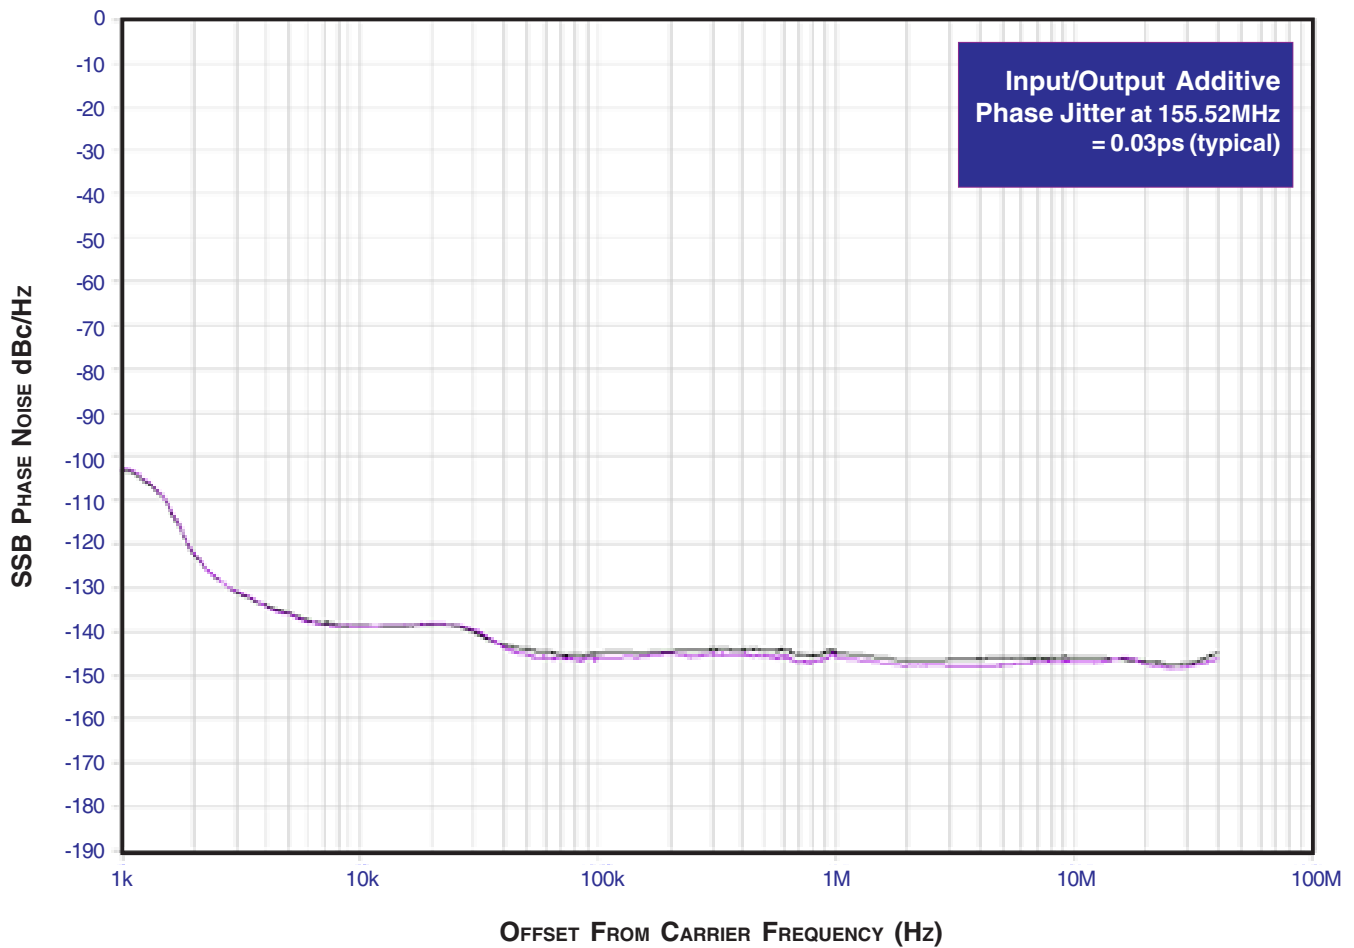

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

### ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in

the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues. The primary issue relates to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The de-

vice meets the noise floor of what is shown, but can actually be lower. The phase noise is dependant on the input source and measurement equipment.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows an example of the differential input that can be wired to accept single ended levels. The reference voltage level  $V_{BB}$  generated from the device is connected to the negative input.

The C1 capacitor should be located as close as possible to the input pin.

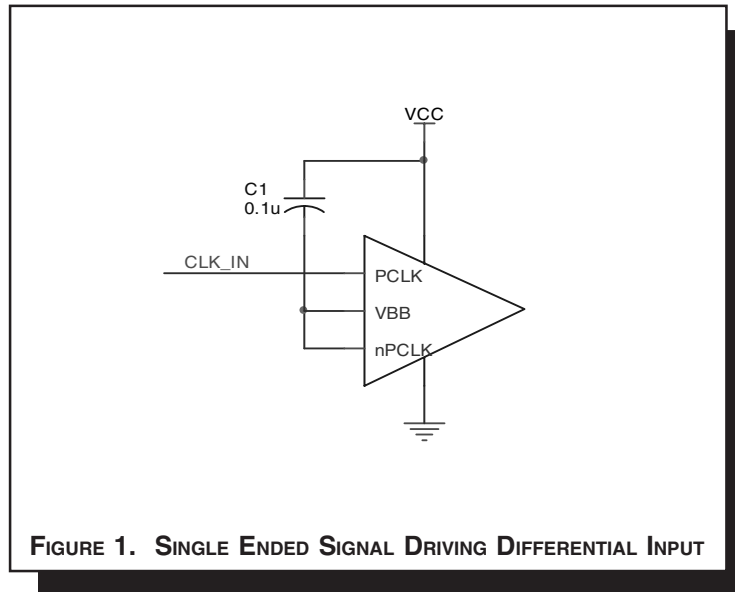

FIGURE 1. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. Figures 2A and 2B show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 2A. LVPECL OUTPUT TERMINATION

FIGURE 2B. LVPECL OUTPUT TERMINATION

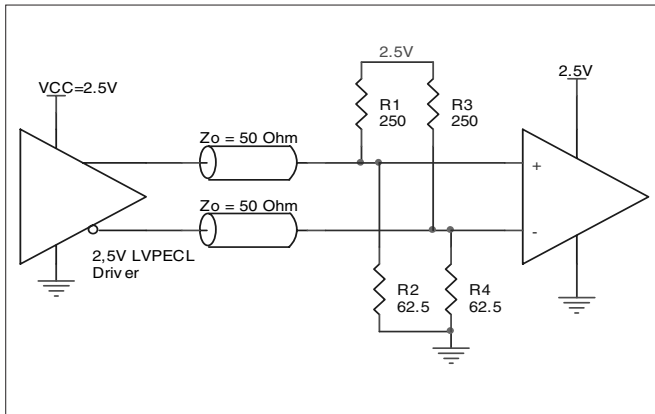

**TERMINATION FOR 2.5V LVPECL OUTPUT**

Figure 3A and Figure 3B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to  $V_{CC} - 2V$ . For  $V_{CC} = 2.5V$ , the  $V_{CC} - 2V$  is very close to

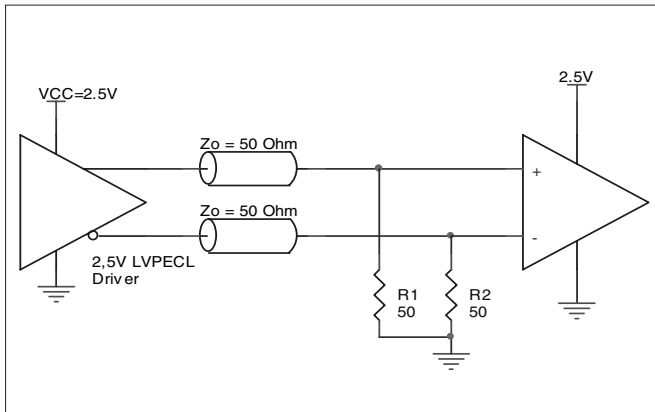

ground level. The R3 in Figure 3B can be eliminated and the termination is shown in Figure 3C.

**FIGURE 3A. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 3B. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 3C. 2.5V LVPECL TERMINATION EXAMPLE**

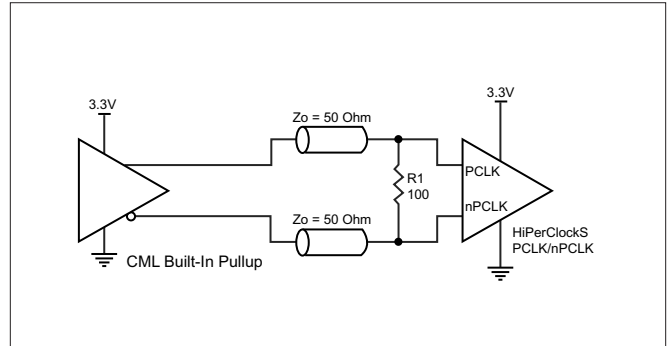

**LVPECL CLOCK INPUT INTERFACE**

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 4A to 4F show interface examples for the HiPerClockS PCLK/nPCLK input driven by the most common driver types. The input interfaces suggested

here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

**SCHEMATIC EXAMPLE**

Figure 5 shows a schematic example of ICS853006. The ICS853006 input can accept various types of differential input signal. In this example, the inputs are driven by an LVPECL drivers. For the ICS853006 LVPECL output driver, an example of LVPECL driver termination approach is shown in this schematic.

Additional LVPECL driver termination approaches are shown in the LVPECL Termination Application Note. It is recommended at least one decoupling capacitor per power pin. The decoupling capacitors should be physically located near the power pins. For ICS853006, the unused output can be left floating.

**FIGURE 5. ICS853006 LVPECL CLOCK OUTPUT BUFFER SCHEMATIC EXAMPLE**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853006. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS853006 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 115mA = 398.48mW$
- Power (outputs)<sub>MAX</sub> = **30.94mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $6 * 30.94mW = 185.64mW$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $398.48mW + 185.64mW = 584.12mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 66.6°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$85^\circ C + 0.584W * 66.6^\circ C/W = 123.9^\circ C$ . This is below the limit of 125°C

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 20-PIN TSSOP, FORCED CONVECTION**

<b><math>\theta_{JA}</math> by Velocity (Linear Feet per Minute)</b>			
	<b>0</b>	<b>200</b>	<b>500</b>
Single-Layer PCB, JEDEC Standard Test Boards	114.5°C/W	98.0°C/W	88.0°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	73.2°C/W	66.6°C/W	63.5°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### 3. Calculations and Equations.

LVPECL output driver circuit and termination are shown in *Figure 6*.

**FIGURE 6. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.935V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.935V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.67V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.67V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V)) / R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX})) / R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.935V) / 50\Omega] * 0.935V = 19.92mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V)) / R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX})) / R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.67V) / 50\Omega] * 1.67V = 11.02mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30.94mW$

## RELIABILITY INFORMATION
