

# LOW VOLTAGE, LVCMOS/LVPECL-TO LVPECL/ECL CLOCK GENERATOR

ICS873991-147

## GENERAL DESCRIPTION

The ICS873991-147 is a low voltage, low skew, 3.3V LVPECL or ECL Clock Generator and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The ICS873991-147 has two selectable clock inputs. The PCLK, nPCLK pair can accept an LVPECL input and the REF\_CLK pin can accept a LVCMOS or LVTTTL input. This device has a fully integrated PLL along with frequency configurable outputs. An external feedback input and output regenerates clocks with “zero delay”.

The four independent banks of outputs each have their own output dividers, which allow the device to generate a multitude of different bank frequency ratios and output-to-input frequency ratios. The output frequency range is 25MHz to 500MHz and the input frequency range is 6.25MHz to 125MHz. The PLL\_SEL input can be used to bypass the PLL for test and system debug purposes. In bypass mode, the input clock is routed around the PLL and into the internal output dividers.

The ICS873991-147 also has a SYNC output which can be used for system synchronization purposes. It monitors Bank A and Bank C outputs for coincident rising edges and signals a pulse per the timing diagrams in this data sheet. This feature is used primarily in applications where Bank A and Bank C are running at different frequencies, and is particularly useful when they are running at non-integer multiples of each other.

### Example Applications:

1. Line Card Multiplier: Multiply 19.44MHz from a back-plane to 77.76MHz on the line card ASIC and Serdes.
2. Zero Delay Buffer: Fan out up to thirteen 100MHz copies from a reference clock to multiple processing units on an embedded system.

## FEATURES

- Fourteen differential 3.3V LVPECL/ECL outputs
- Selectable differential LVPECL or REF\_CLK inputs
- PCLK, nPCLK can accept the following input levels: LVPECL, CML, SSTL
- REF\_CLK accepts the following input levels: LVCMOS, LVTTTL
- Input clock frequency range: 6.25MHz to 125MHz
- Maximum output frequency: 500MHz
- VCO range: 200MHz to 1GHz
- Output skew: 70ps (typical)
- Cycle-to-cycle jitter: 35ps (typical)
- LVPECL mode operating voltage supply range:  $V_{CC} = 3.135V$  to  $3.465V$ ,  $V_{EE} = 0V$
- ECL mode operating voltage supply range:  $V_{CC} = 0V$ ,  $V_{EE} = -3.465V$  to  $-3.135V$
- 0°C to 70°C ambient operating temperature
- Available in lead-free (RoHS 6) package
- Industrial temperature available upon request

## PIN ASSIGNMENT

The Preliminary Information presented herein represents a product in pre-production. The noted characteristics are based on initial product characterization and/or qualification. Integrated Device Technology, Incorporated (IDT) reserves the right to change any circuitry or specifications without notice.

# BLOCK DIAGRAM

TABLE 1. PIN DESCRIPTIONS

| Number               | Name                             | Type   |                     | Description   |
|----------------------|----------------------------------|--------|---------------------|---|
| 1                    | V <sub>EE</sub>                  | Power  |                     | Negative supply pin.  |
| 2                    | MR                               | Input  | Pulldown            | Active High Master Reset. When logic HIGH, the internal dividers are reset causing the true outputs (Qx) to go low and the inverted outputs (nQx) to go high. When logic LOW, the internal dividers and the outputs are enabled. LVCMOS/LVTTL interface levels. |
| 3                    | PLL_EN                           | Input  | Pulldown            | PLL enable pin. When logic LOW, PLL is enabled. When logic HIGH, PLL is in bypass mode. LVCMOS/LVTTL interface levels.  |
| 4                    | REF_SEL                          | Input  | Pulldown            | Selects between the different reference inputs as the PLL reference source. When logic LOW, selects PCLK/nPCLK. When logic HIGH, selects REF_CLK. LVCMOS/LVTTL interface levels.  |
| 5                    | FSEL_FB2                         | Input  | Pulldown            | Feedback frequency select pins. LVCMOS/LVTTL interface levels.  |
| 6                    | FSEL_FB1                         |        |                     |   |
| 7                    | FSEL_FB0                         |        |                     |   |
| 8                    | REF_CLK                          | Input  | Pulldown            | Reference clock input. LVCMOS/LVTTL interface levels.   |
| 9                    | PCLK                             | Input  | Pulldown            | Non-inverting differential LVPECL clock input.  |
| 10                   | nPCLK                            | Input  | Pullup/<br>Pulldown | Inverting differential LVPECL clock input. V <sub>CC</sub> /2 default when left floating.   |
| 11                   | V <sub>CC</sub>                  | Power  |                     | Core supply pin.  |
| 12                   | EXT_FB                           | Input  | Pulldown            | Non-inverting external feedback input.  |
| 13                   | nEXT_FB                          | Input  | Pullup/<br>Pulldown | Inverting external feedback input. V <sub>CC</sub> /2 default when left floating.   |
| 14                   | V <sub>CCA</sub>                 | Power  |                     | Analog supply pin.  |
| 15<br>16             | nQFB<br>QFB                      | Output |                     | Differential feedback output pair. LVPECL Interface levels.   |
| 17, 22, 30, 42       | V <sub>CCO</sub>                 | Power  |                     | Output supply pins.   |
| 18, 19               | nQD0, QD0                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 20, 21               | nQD1, QD1                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 23, 24               | nQC0, QC0                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 25, 26               | nQC1, QC1                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 27<br>33<br>36<br>39 | FSEL3<br>FSEL2<br>FSEL1<br>FSEL0 | Input  | Pulldown            | Frequency select pins. LVCMOS/LVTTL interface levels.   |
| 28, 29               | nQC2, QC2                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 31, 32               | nQB0, QB0                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 34, 35               | nQB1, QB1                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 37, 38               | nQB2, QB2                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 40, 41               | nQB3, QB3                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 43, 44               | nQA0, QA0                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 45, 46               | nQA1, QA1                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 47, 48               | nQA2, QA2                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 49, 50               | nQA3, QA3                        | Output |                     | Differential output pair. LVPECL interface levels.  |
| 51                   | SYNC_SEL                         | Input  | Pulldown            | SYNC output select pin. When LOW, the SYNC output follows the timing diagram (page 5). When HIGH, QD output follows QC output LVCMOS/LVTTL interface levels..   |
| 52                   | VCO_SEL                          | Input  | Pulldown            | Selects VCO range. LVCMOS/LVTTL interface levels.   |

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

TABLE 2. PIN CHARACTERISTICS

| Symbol         | Parameter               | Test Conditions | Minimum | Typical | Maximum | Units      |

FIGURE 1. TIMING DIAGRAMS

**ABSOLUTE MAXIMUM RATINGS**

|  |                           |
|--|---------------------------|
| Supply Voltage, $V_{CC}$                 | 4.6V                      |
| Inputs, $V_I$                            | -0.5V to $V_{CC} + 0.5 V$ |
| Outputs, $I_O$                           |                           |
| Continuous Current                       | 50mA                      |
| Surge Current                            | 100mA                     |
| Package Thermal Impedance, $\theta_{JA}$ | 63.7°C/W (0 mps)          |
| Storage Temperature, $T_{STG}$           | -65°C to 150°C            |

**NOTE:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

All parameters measured at  $f_{MAX}$  unless noted otherwise.

NOTE 1: SYNC output (QD when SYNC\_SEL = 0) operation guaranteed to 800MHz maximum VCO frequency.

NOTE 2: Defined as the time difference between the input reference clock and the average feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 3: Static phase offset is specified for an input frequency of 50MHz with feedback in  $\div 8$ .

NOTE 4: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 5: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 6: Defined as skew across banks of outputs switching in the same direction operating at different frequencies with the same supply voltages and equal load conditions. Measured at  $V_{CCO}/2$ .

NOTE 7: When VCO\_SEL = 0, the PLL will be unstable with feedback configurations of  $\div 2$ ,  $\div 4$  and some  $\div 6$ .

When VCO\_SEL = 1, the PLL will be unstable with a feedback configuration of  $\div 2$ .

## APPLICATIONS INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS873991-147 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$ ,  $V_{CCA}$  and  $V_{CCO}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 2* illustrates how a  $10\Omega$  resistor along with a  $10\mu\text{F}$  and a  $0.01\mu\text{F}$  bypass capacitor should be connected to each  $V_{CCA}$  pin.

FIGURE 2. POWER SUPPLY FILTERING

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

*Figure 3* shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{CC}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3\text{V}$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 3. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### LVPECL CLOCK INPUT INTERFACE

The PCLK/nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 4A to 4E show interface examples for the HiPerClockS PCLK/nPCLK input driven by the most common driver types. The input interfaces suggested

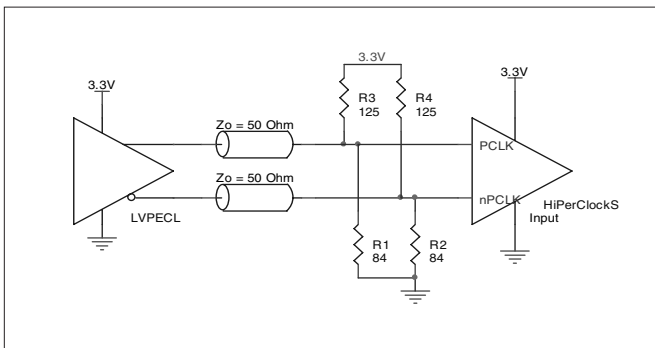

here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

## RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

### INPUTS:

#### PCLK/nPCLK INPUTS

For applications not requiring the use of a differential input, both the PCLK and nPCLK pins can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from PCLK to ground.

#### LVCMOS CONTROL PINS

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

### OUTPUTS:

#### LVPECL OUTPUTS

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 5A and 5B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 5B. LVPECL OUTPUT TERMINATION

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS873991-147. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS873991-147 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC,MAX} * I_{EE,MAX} = 3.465V * 150mA = 519.75mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $14 * 30mW = 420mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 519.75mW + 420mW = 939.75mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd_{total} + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 55.5°C/W per Table 7 below.

Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ\text{C} + 0.940\text{W} * 55.5^\circ\text{C/W} = 122.2^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 7. THERMAL RESISTANCE  $\theta_{JA}$  FOR 52-PIN LQFP FORCED CONVECTION**

|   | $\theta_{JA}$ by Velocity (Meters per Second) |          |          |
|---|---|----------|----------|
|   | 0   | 1        | 2.5      |
| Multi-Layer PCB, JEDEC Standard Test Boards | 63.7°C/W                                      | 55.5°C/W | 52.4°C/W |

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

**FIGURE 6. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CCO} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CCO\_MAX} - 0.9V$

$$(V_{CCO\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CCO\_MAX} - 1.7V$

$$(V_{CCO\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30mW$
