

## 25-Bit Configurable Registered Buffer

### Recommended Application:

- DDR2 Memory Modules
- Provides complete DDR DIMM logic solution with ICS97U877

### Product Features:

- 25-bit 1:1 or 14-bit 1:2 configurable registered buffer with parity check functionality
- Supports SSTL\_18 JEDEC specification on data inputs and outputs
- Supports LVCMOS switching levels on CSR# and RESET# inputs
- Low voltage operation  
V<sub>DD</sub> = 1.7V to 1.9V
- Available in 96 BGA package

**Register B (C0 = 1, C1 = 1)**

## General Description

This 25-bit 1:1 or 14-bit 1:2 configurable registered buffer is designed for 1.7-V to 1.9-V VDD operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL\_18. The control inputs are LVCMOS. All outputs are 1.8-V CMOS drivers that have been optimized to drive the DDR-II DIMM load. **ICSSSTU32866** operates from a differential clock (CK and CK#). Data are registered at the crossing of CK going high, and CK# going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when low) to B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

### A - Pair Configuration (CO<sub>1</sub> = 0, CI<sub>1</sub> = 1 and CO<sub>2</sub> = 0, CI<sub>2</sub> = 1)

Parity that arrives one cycle after the data input to which it applies is checked on the PAR\_IN of the first register. The second register produces PPO and QERR# signals. The QERR# of the first register is left floating. The valid error information is latched on the QERR# output of the second register. If an error occurs QERR# is latched low for two cycles or until Reset# is low.

### B - Single Configuration (CO = 0, C1 = 0)

The device supports low-power standby operation. When the reset input (RST#) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when RST# is low all registers are reset, and all outputs are forced low. The LVCMOS RST# and Cn inputs must always be held at a valid logic high or low level. To ensure defined outputs from the register before a stable clock has been supplied, RST# must be held in the low state during power up.

In the DDR-II RDIMM application, RST# is specified to be completely asynchronous with respect to CK and CK#. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of RST# until the input receivers are fully enabled, the design of the **ICSSSTU32866** must ensure that the outputs will remain low, thus ensuring no glitches on the output.

The device monitors both DCS# and CSR# inputs and will gate the Qn outputs from changing states when both DCS# and CSR# inputs are high. If either DCS# or CSR# input is low, the Qn outputs will function normally. The RST input has priority over the DCS# and CSR# control and will force the outputs low. If the DCS#-control functionality is not desired, then the CSR# input can be hardwired to ground, in which case, the setup-time requirement for DCS# would be the same as for the other D data inputs. Package options include 96-ball LFBGA (MO-205CC).

CO = 1 and CI = 1, Data inputs are D1 - D6, D8 - D10, D12, D13
- PAR\_IN arrives one clock cycle after the data to which it applies when CO = 0.
- PAR\_IN arrives two clock cycles after the data to which it applies when CO = 1.
- Assume QERR# is high at the CK↑ and CK#↓ crossing. If QERR# is low it stays latched low for two clock cycles on until Reset# is low.

Package Thermal Impedance <sup>3</sup>	36°C

**Notes:**

1. The input and output negative voltage ratings may be excluded if the input and output clamp ratings are observed.
2. This current will flow only when the output is in the high state level  $V_0 > V_{DDQ}$ .
3. The package thermal impedance is calculated in accordance with JESD 51.

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.
