Advance Information

25-Bit Configurable Registered Buffer for DDR2

Recommended Application:

- DDR2 Memory Modules
- Provides complete DDR DIMM solution with ICS97ULP877
- Ideal for DDR2 667, and 800

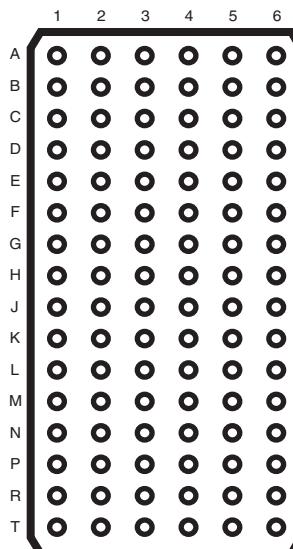

Product Features:

- 25-bit 1:1 or 14-bit 1:2 configurable registered buffer with parity check functionality
- Supports SSTL_18 JEDEC specification on data inputs and outputs
- Supports LVCMS switching levels on $\overline{\text{CSR}}$ and $\overline{\text{RESET}}$ inputs
- Low voltage operation $V_{DD} = 1.7V$ to $1.9V$
- Available in 96 BGA package
- Drop-in replacement for ICSSSTUA32864
- Green packages available

Register B (C0 = 1, C1 = 1)

General Description

This 25-bit 1:1 or 14-bit 1:2 configurable registered buffer is designed for 1.7-V to 1.9-V VDD operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVCMOS. All outputs are 1.8-V CMOS drivers that have been optimized to drive the DDR-II DIMM load. **ICSSSTUBF32866A** operates from a differential clock (CK and \bar{CK}). Data are registered at the crossing of CK going high, and \bar{CK} going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when low) to B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

A - Pair Configuration (CO₁ = 0, CI₁ = 1 and CO₂ = 0, CI₂ = 1)

Parity that arrives one cycle after the data input to which it applies is checked on the PAR_IN of the first register. The second register produces to PPO and QERR signals. The QERR of the first register is left floating. The valid error information is latched on the QERR output of the second register. If an error occurs QERR is latched low for two cycles or until Reset is low.

B - Single Configuration (CO = 0, C1 = 0)

The device supports low-power standby operation. When the reset input (\bar{RST}) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when \bar{RST} is low all registers are reset, and all outputs are forced low. The LVCMOS RST and Cn inputs must always be held at a valid logic high or low level. To ensure defined outputs from the register before a stable clock has been supplied, \bar{RST} must be held in the low state during power up.

In the DDR-II RDIMM application, \bar{RST} is specified to be completely asynchronous with respect to CK and \bar{CK} . Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of \bar{RST} until the input receivers are fully enabled, the design of the **ICSSSTUBF32866A** must ensure that the outputs will remain low, thus ensuring no glitches on the output.

The device monitors both \bar{DCS} and \bar{CSR} inputs and will gate the Qn outputs from changing states when both \bar{DCS} and \bar{CSR} inputs are high. If either \bar{DCS} or \bar{CSR} input is low, the Qn outputs will function normally. The \bar{RST} input has priority over the \bar{DCS} and \bar{CSR} control and will force the outputs low. If the \bar{DCS} -control functionality is not desired, then the \bar{CSR} input can be hardwired to ground, in which case, the setup-time requirement for DCS would be the same as for the other D data inputs. Package options include 96-ball LFBGA (MO-205CC).

Parity and Standby Functionality Truth Table

Inputs					Outputs			
Rst	DCS	CSR	CK	\bar{CK}	Sum of Inputs = H (D1 - D25)	PAR_IN	PPO	QERR
H	L	X	↑	↓	Even	L	L	H

H	L	X	↑	↓	Even	H	H	L
H	L	X	↑	↓	Odd	H	L	H
H	H	L	↑	↓	Even	L	L	H
H	H	L	↑	↓	Odd	H	H	L
H	H	H	↑	↓	X	X	PPO ₀	QERR ₀
H	X	X	L or H	L or H	X	X	PPO ₀	QERR ₀
L	X or Floating	X or Floating	L	H				

1. CO = 0 and CI = 0, Data inputs are D2, D3, D5, D6, D8 - D25.
CO = 0 and CI = 1, Data inputs are D2, D3, D5, D6, D8 - D14
CO = 1 and CI = 1, Data inputs are D1 - D6, D8 - D10, D12, D13
2. PAR_IN arrives one clock cycle after the data to which it applies when CO = 0.
3. PAR_IN arrives two clock cycles after the data to which it applies when CO = 1.
4. Assume QERR is high at the CK↑ and CK↓ crossing. If QERR is low it stays latched low for two clock cycles on until Rst is low.

Absolute Maximum Ratings

Storage Temperature	-65°C to +150°C
Supply Voltage.....	-0.5V to 2.5V
Input Voltage ^{1,2}	-0.5V to +2.5V
Output Voltage ^{1,2}	-0.5V to VDD + 0.5V
Input Clamp Current	±50 mA
Output Clamp Current.....	±50mA
Continuous Output Current.....	±50mA
VDD or GND Current/Pin	±100mA
Package Thermal Impedance ³	36°C

Notes:

1. The input and output negative voltage ratings may be excluded if the input and output clamp ratings are observed.
2. This value is limited to 2.5V maximum.
3. The package thermal impedance is calculated in accordance with JESD 51.

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Recommended Operating Conditions

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNITS

All input pulses are supplied by generators having the following characteristics: PRR $\leq 10 \text{ MHz}$; $Z_o = 50\Omega$; input slew rate = $1 \text{ V/ns} \pm 20\%$, unless otherwise specified.

LOAD CIRCUIT – HIGH-TO-LOW SLEW-RATE MEASUREMENT

(1) C_L includes probe and jig capacitance.

Figure 28 — Load circuit, error output measurements

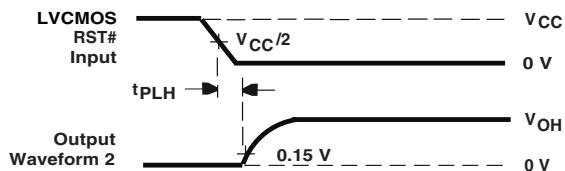

Figure 29 — Voltage waveforms, open-drain output low-to-high transition time with respect to reset input

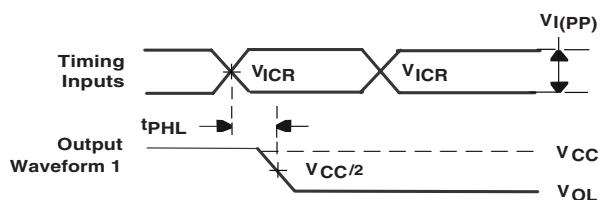

Figure 30 — Voltage waveforms, open-drain output high-to-low transition time with respect to clock inputs

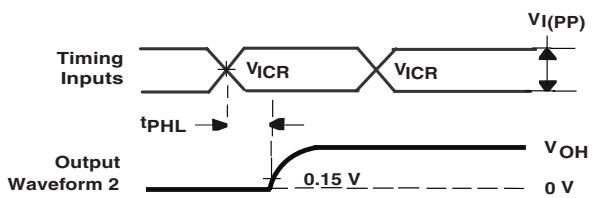

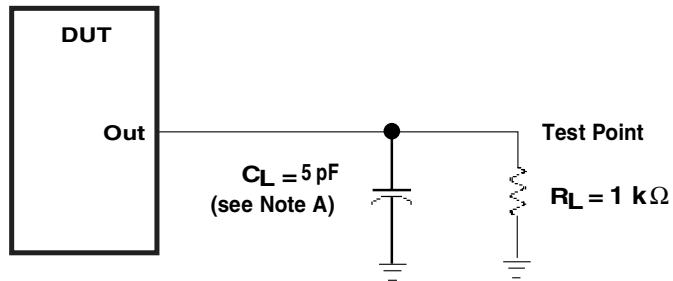

Figure 31 — Voltage waveforms, open-drain output low-to-high transition time with respect to clock inputs

Test circuits and switching waveforms (cont'd)

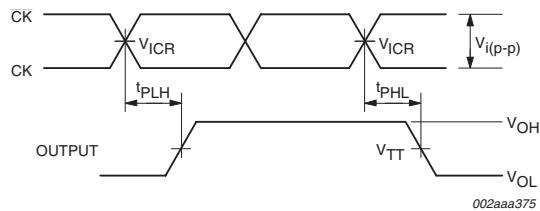

3.4 Partial-parity-out load circuit and voltage measurement information ($V_{DD} = 1.8 \text{ V} \pm 0.1 \text{ V}$)

All input pulses are supplied by generators having the following characteristics: PRR $\leq 10 \text{ MHz}$; $Z_o = 50\Omega$ input slew rate = $1 \text{ V/ns} \pm 20\%$, unless otherwise specified.

(1) C_L includes probe and jig capacitance.

Figure 32 — Partial-parity-out load circuit,

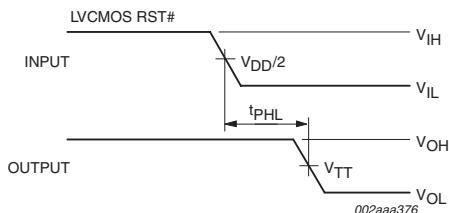

$$V_{TT} = V_{DD}/2$$

t_{PLH} an t_{PHL} are the same as t_{PD} .

$$V_{I(P)P} = 600 \text{ mV}$$

Figure 33 — Partial-parity-out voltage waveforms; propagation delay times with respect to clock inputs

$$V_{TT} = V_{DD}/2$$

t_{PLH} an t_{PHL} are the same as t_{PD} .

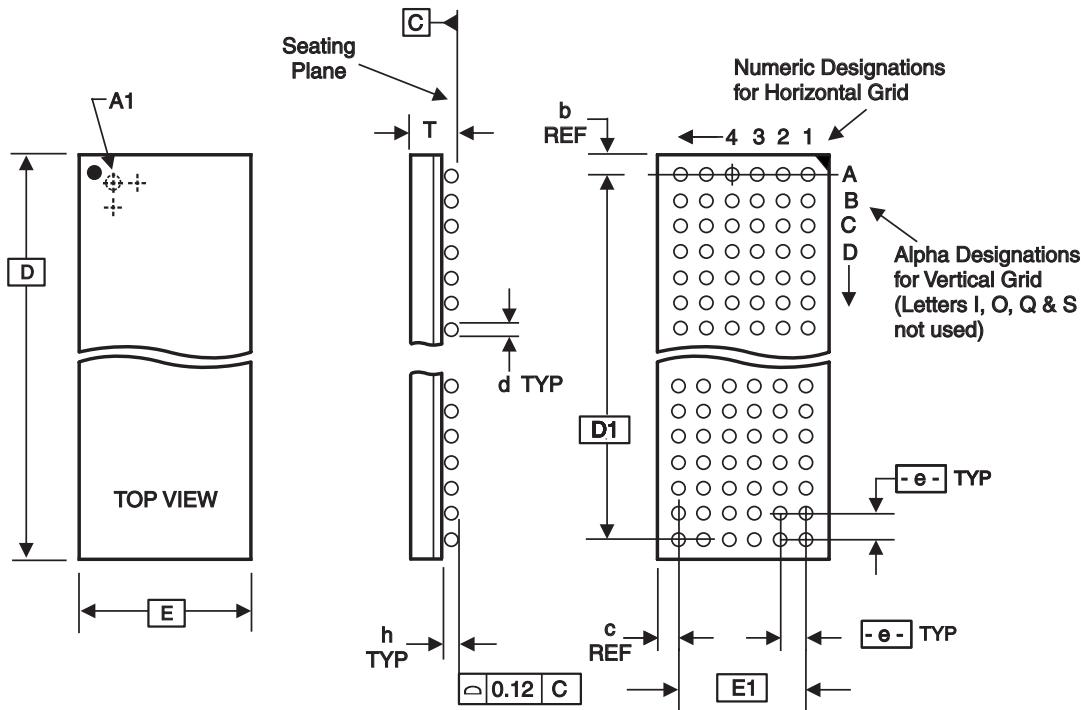

$$V_{IH} = V_{REF} + 250 \text{ mV}$$
 (AC voltage levels for differential inputs. $V_{IH} = V_{DD}$ for LVCMS inputs.

$$V_{IL} = V_{REF} - 250 \text{ mV}$$
 (AC voltage levels for differential inputs. $V_{IL} = V_{DD}$ for LVCMS inputs.

Figure 34 — Partial-parity-out voltage waveforms; propagation delay times with respect to reset input

ICSSSTUBF32866A Advance Information

ALL DIMENSIONS IN MILLIMETERS

D	E	T	e	---- BALL GRID -----			Max. TOTAL	d	h	REF. DIMENSIONS

Ordering Information

ICSSSTUBF32866Az(LF)T

Example:

ICS XXXX y z (LF) T

Designation for tape and reel packaging

Lead Free, RoHS Compliant (Optional)

Package Type

H = LFBGA (standard size: 5.5 x 13.50)

HM = TFBGA (reduced size: 5.0 x 11.50)

Revision Designator (will not correlate with datasheet revision)

Device Type

Prefix

ICS = Standard Device
