

Diagonal 6mm (Type 1/3) CCD Image Sensor for NTSC Color Video Cameras

Description

The ICX054BK is an interline CCD solid-state image sensor suitable for NTSC color video cameras. Compared with the current product ICX054AK, sensitivity is improved drastically through the adoption of Super HAD CCD technology. Ye, Cy, Mg, and G complementary color mosaic filters are used.

This chip features a field period readout system, and an electronic shutter with variable charge-storage time.

Features

- High sensitivity (+3dB at F5.6, +1.5dB at F1.2 compared with ICX054AK)
- High saturation signal (+1dB compared with ICX054AK)
- Low smear and low dark current
- Excellent antiblooming characteristics
- Continuous variable-speed shutter
- Ye, Cy, Mg and G complementary color mosaic filters on chip
- Horizontal register: 5V drive
- Reset gate: 5V drive

Optical black position
(Top View)

Device Structure

- Interline CCD image sensor
- Image size: Diagonal 6mm (Type 1/3)
- Number of effective pixels: 510 (H) × 492 (V) approx. 250K pixels
- Number of total pixels: 537 (H) × 505 (V) approx. 270K pixels
- Chip size: 6.00mm (H) × 4.96mm (V)
- Unit cell size: 9.6μm (H) × 7.5μm (V)
- Optical black:

Horizontal (H) direction:	Front 2 pixels, Rear 25 pixels
Vertical (V) direction:	Front 12 pixels, Rear 1 pixel
- Number of dummy bits:

Horizontal	16
Vertical	1 (even field only)
- Substrate material: Silicon

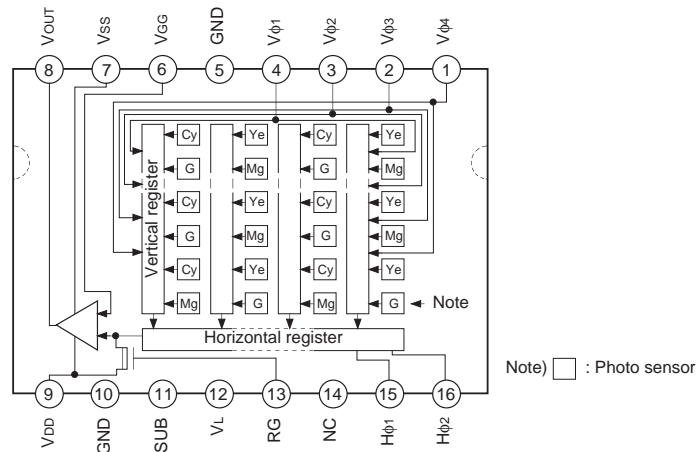

Super HAD CCD®

*Super HAD CCD is a registered trademark of Sony Corporation. Super HAD CCD is a CCD that drastically improves sensitivity by introducing newly developed semiconductor technology by Sony Corporation into Sony's high-performance HAD (Hole-Accumulation Diode) sensor.

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

*1 Indications of substrate voltage (V_{SUB}) · reset gate clock voltage (V_{RGL}) setting value.

The setting values of substrate voltage and reset gate clock voltage are indicated on the back of the image sensor by a special code. Adjust substrate voltage (V_{SUB}) and reset gate clock voltage (V_{RGL}) to the indicated voltage. Fluctuation range after adjustment is ±3%.

V _{SUB} code	one character indication	<input type="checkbox"/>	<input type="checkbox"/>
V _{RGL} code	one character indication	↑	↑
		V _{RGL} code	V _{SUB} code

Code and optimal setting correspond to each other as follows.

V _{RGL} code	1	2	3	4	5	6	7
Optimal setting	1.0	1.5	2.0	2.5	3.0	3.5	4.0

V _{SUB} code	E	f	G	h	J	K	L	m	N	P	Q	R	S	T	U	V	W	X	Y	Z
Optimal setting	9.0	9.5	10.0	10.5	11.0	11.5	12.0	12.5	13.0	13.5	14.0	14.5	15.0	15.5	16.0	16.5	17.0	17.5	18.0	18.5

<Example> “5L” → V_{RGL} = 3.0V
V_{SUB} = 12.0V

*2 V_L setting is the V_{VL} voltage of the vertical transfer clock waveform.

- *3 1) Current to each pin when 18V is applied to V_{DD}, V_{OUT}, V_{SS} and SUB pins, while pins that are not tested are grounded.
- 2) Current to each pin when 20V is applied sequentially to V_{φ1}, V_{φ2}, V_{φ3} and V_{φ4} pins, while pins that are not tested are grounded. However, 20V is applied to SUB pin.
- 3) Current to each pin when 15V is applied sequentially to RG, H_{φ1}, H_{φ2} and V_{GG} pins, while pins that are not tested are grounded. However, 15V is applied to SUB pin.
- 4) Current to V_L pin when 30V is applied to V_{φ1}, V_{φ2}, V_{φ3}, V_{φ4}, V_{DD} and V_{OUT} pins or when, 24V is applied to RG pin or when, 20V is applied to V_{GG}, V_{SS}, H_{φ1} and H_{φ2} pins, while V_L pin is grounded. However, GND and SUB pins are left open.

*4 Current to SUB pin when 55V is applied to SUB pin, while pins that are not tested are grounded.

Clock Voltage Conditions

Item	Symbol	Min.	Typ.	Max.	Unit	Waveform diagram	Remarks
Readout clock voltage	V_{VT}	14.55	15.0	15.45	V	1	
Vertical transfer clock voltage	V_{VH1}, V_{VH2}	-0.05	0	0.05	V	2	$V_{VH} = (V_{VH1} + V_{VH2}) / 2$
	V_{VH3}, V_{VH4}	-0.2	0	0.05	V	2	
	$V_{VL1}, V_{VL2}, V_{VL3}, V_{VL4}$	-9.0	-8.5	-8.0	V	2	$V_{VL} = (V_{VL3} + V_{VL4}) / 2$
	$V_{\phi V}$	7.8	8.5	9.05	V	2	$V_{\phi V} = V_{VHn} - V_{VLn} (n = 1 \text{ to } 4)$
	$ V_{VH1} - V_{VH2} $			0.1	V	2	
	$V_{VH3} - V_{VH}$	-0.25		0.1	V	2

Vertical transfer clock equivalent circuit

Horizontal transfer clock equivalent circuit

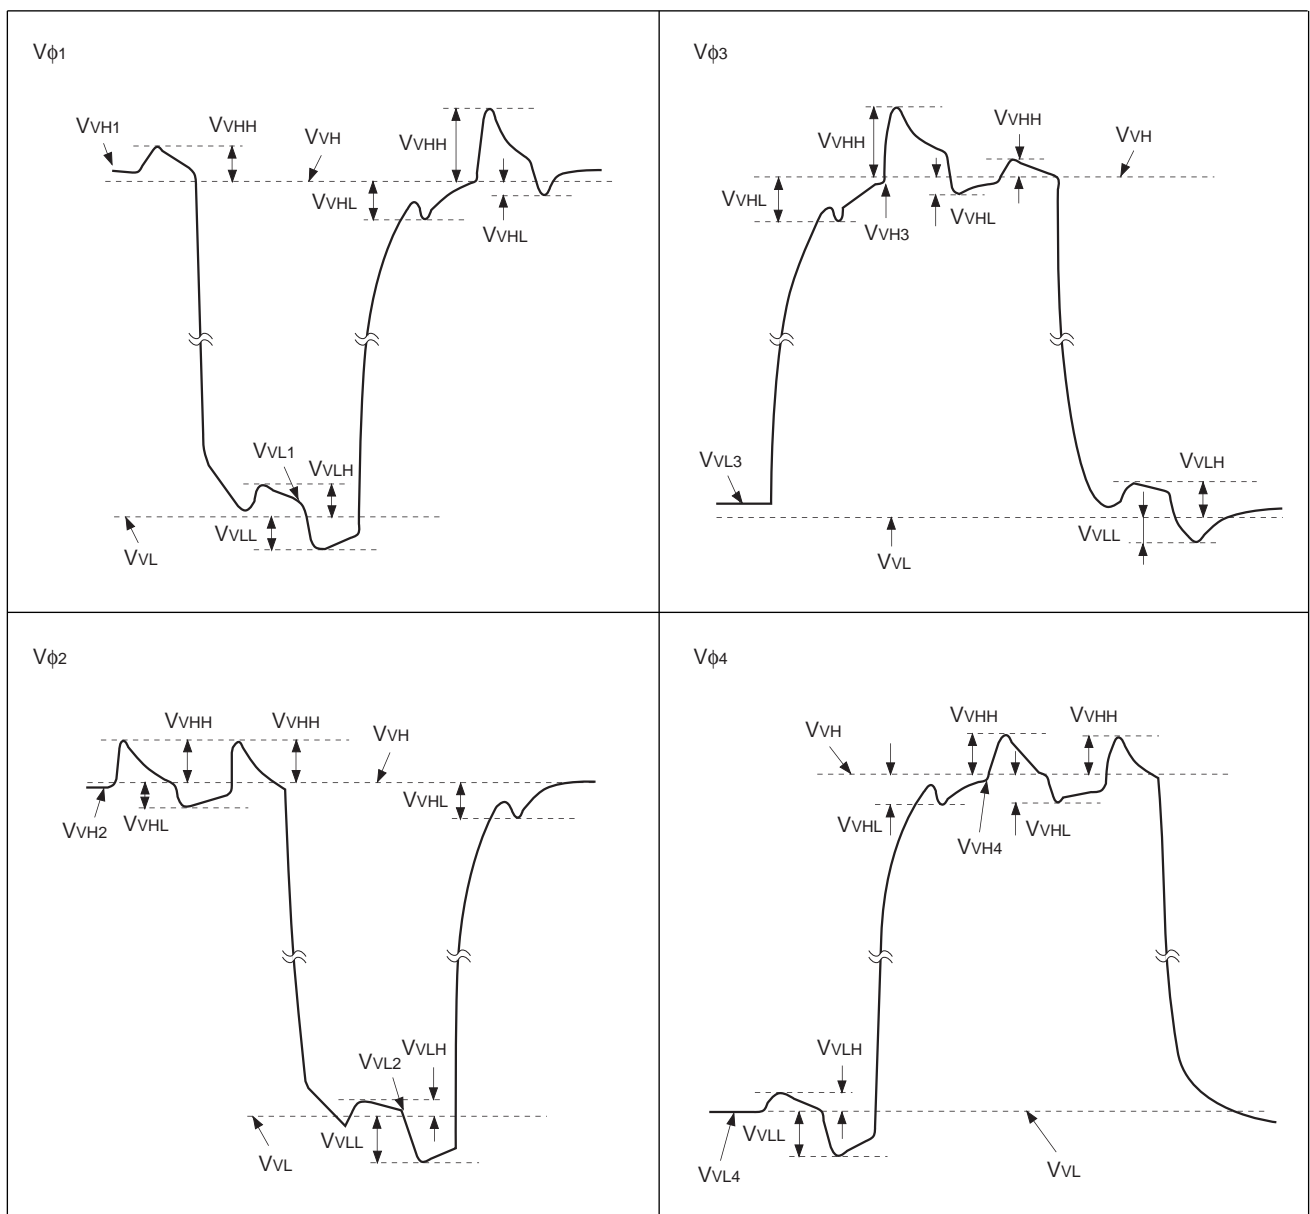

Reset gate clock equivalent circuit

Drive Clock Waveform Conditions

(1) Readout clock waveform

(2) Vertical transfer clock waveform

$$V_{VH} = (V_{VH1} + V_{VH2})/2$$

$$V_{VL} = (V_{VL3} + V_{VL4})/2$$

$$V\phi_n = V_{VHn} - V_{VVLn} \quad (n = 1 \text{ to } 4)$$

(3) Horizontal transfer clock waveform

(4) Reset gate clock waveform

V_{RGLH} is the maximum value and V_{RGLL} is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG.

In addition, V_{RGL} is the average value of V_{RGLH} and V_{RGLL} .

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2$$

Assuming V_{RGH} is the minimum value during the interval t_{wh} , then:

$$V_{\phi RG} = V_{RGH} - V_{RGL}$$

(5) Substrate clock waveform

Zone Definition of Video Signal Shading

Measurement System

Note) Adjust the amplifier gain so that the gain between [*A] and [*Y] and between [*A] and [*C] equal 1.

Image Sensor Characteristics Measurement Method

◎ **Measurement conditions**

- 1) In the following measurements, the substrate voltage and the reset gate clock voltage are set to the values indicated on the device, and the device drive conditions are at the typical values of the bias and clock voltage conditions.
- 2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black level (OB) is used as the reference for the signal output, which is taken as the value of Y signal output or chroma signal output of the measurement system.

◎ **Color coding of this image sensor & Composition of luminance (Y) and chroma (color difference) signals**

As shown in the left figure, fields are read out. The charge is mixed by pairs such as A1 and A2 in the A field. (pairs such as B in the B field)
 As a result, the sequence of charges output as signals from the horizontal shift register (Hreg) is, for line A1, (G + Cy), (Mg + Ye), (G + Cy), and (Mg + Ye).

Color Coding Diagram

These signals are processed to form the Y signal and chroma (color difference) signal. The Y signal is formed by adding adjacent signals, and the chroma signal is formed by subtracting adjacent signals. In other words, the approximation:

$$Y = \{(G + Cy) + (Mg + Ye)\} \times 1/2$$

$$= 1/2 \{2B + 3G + 2R\}$$

is used for the Y signal, and the approximation:

$$R - Y = \{(Mg + Ye) - (G + Cy)\}$$

$$= \{2R - G\}$$

is used for the chroma (color difference) signal. For line A2, the signals output from Hreg in sequence are

$$(Mg + Cy), (G + Ye), (Mg + Cy), (G + Ye).$$

The Y signal is formed from these signals as follows:

$$Y = \{(G + Ye) + (Mg + Cy)\} \times 1/2$$

$$= 1/2 \{2B + 3G + 2R\}$$

This is balanced since it is formed in the same way as for line A1.

In a like manner, the chroma (color difference) signal is approximated as follows:

$$-(B - Y) = \{(G + Ye) - (Mg + Cy)\}$$

$$= -\{2B - G\}$$

In other words, the chroma signal can be retrieved according to the sequence of lines from R - Y and - (B - Y) in alternation. This is also true for the B field.

© Definition of standard imaging conditions

1) Standard imaging condition I:

Use a pattern box (luminance 706cd/m², color temperature of 3200K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

2) Standard imaging condition II:

Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

1. Sensitivity

Set to standard imaging condition I. After selecting the electronic shutter mode with a shutter speed of 1/250s, measure the Y signal (Ys) at the center of the screen and substitute the value into the following formula.

$$S = Y_s \times \frac{250}{60} \text{ [mV]}$$

2. Saturation signal

Set to standard imaging condition II. After adjusting the luminous intensity to 10 times the intensity with average value of the Y signal output, 200mV, measure the minimum value of the Y signal.

3. Smear

Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity to 500 times the intensity with average value of the Y signal output, 200mV. When the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value YSm [mV] of the Y signal output and substitute the value into the following formula.

$$S_m = \frac{Y_{Sm}}{200} \times \frac{1}{500} \times \frac{1}{10} \times 100 \text{ [%]} \text{ (1/10V method conversion value)}$$

4. Video signal shading

Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity so that the average value of the Y signal output is 200mV. Then measure the maximum (Ymax [mV]) and minimum (Ymin [mV]) values of the Y signal and substitute the values into the following formula.

$$SH_y = (Y_{max} - Y_{min})/200 \times 100 \text{ [%]}$$

5. Uniformity between video signal channels

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then measure the maximum (Crmax, Cbmax [mV]) and minimum (Crmin, Cbmin [mV]) values of the R – Y and B – Y channels of the chroma signal and substitute the values into the following formula.

$$\Delta S_r = | (C_{rmax} - C_{rmin})/200 | \times 100 \text{ [%]}$$

$$\Delta S_b = | (C_{bmax} - C_{bmin})/200 | \times 100 \text{ [%]}$$

6. Dark signal

Measure the average value of the Y signal output (Ydt [mV]) with the device ambient temperature 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

7. Dark signal shading

After measuring 6, measure the maximum (Y_{dmax} [mV]) and minimum (Y_{dmin} [mV]) values of the Y signal output and substitute the values into the following formula.

$$\Delta Y_{dt} = Y_{dmax} - Y_{dmin} \text{ [mV]}$$

8. Flicker

1) F_y

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then measure the difference in the signal level between fields (ΔY_f [mV]). Then substitute the value into the following formula.

$$F_y = (\Delta Y_f / 200) \times 100 \text{ [%]}$$

2) F_{cr} , F_{cb}

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, insert an R or B filter, and then measure both the difference in the signal level between fields of the chroma signal (ΔC_r , ΔC_b) as well as the average value of the chroma signal output (C_{Ar} , C_{Ab}). Substitute the values into the following formula.

$$F_{ci} = (\Delta C_i / C_{Ai}) \times 100 \text{ [%]} \text{ (i = r, b)}$$

9. Line crawls

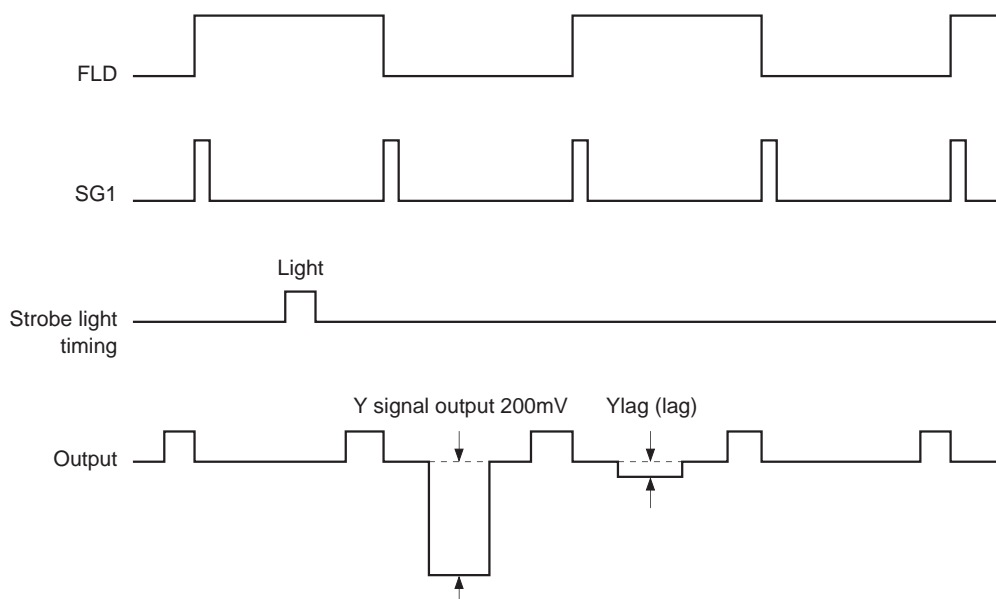

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then insert a white subject and R, G, and B filters and measure the difference between Y signal lines for the same field (ΔY_{lw} , ΔY_{lr} , ΔY_{lg} , ΔY_{lb} [mV]). Substitute the values into the following formula.

$$L_{ci} = (\Delta Y_{li} / 200) \times 100 \text{ [%]} \text{ (i = w, r, g, b)}$$

10. Lag

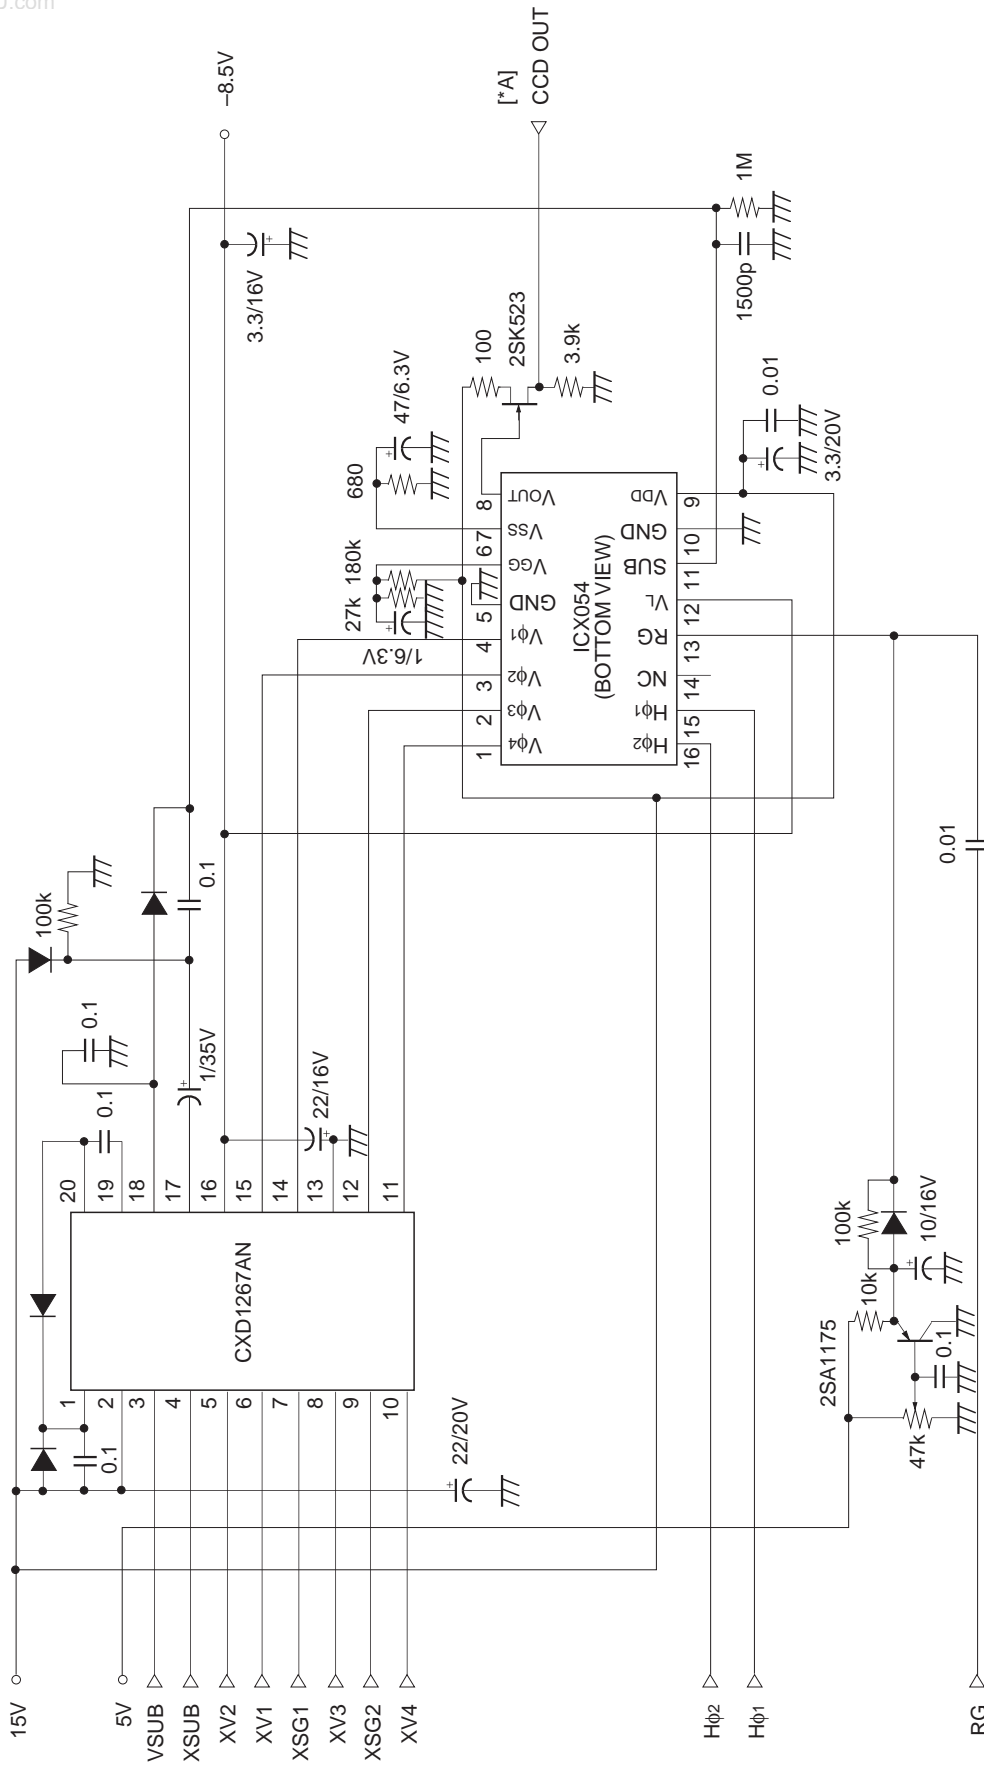

Adjust the Y signal output value generated by strobe light to 200mV. After setting the strobe light so that it strobos with the following timing, measure the residual signal (Y_{lag}). Substitute the value into the following formula.

$$Lag = (Y_{lag} / 200) \times 100 \text{ [%]}$$

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- a) Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- b) When handling directly use an earth band.
- c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- d) Ionized air is recommended for discharge when handling CCD image sensor.
- e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

2) Soldering

- a) Make sure the package temperature does not exceed 80°C.
- b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero cross On/Off type and connect it to ground.

3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operation as required, and use them.

- a) Perform all assembly operations in a clean room (class 1000 or less).
- b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)
- c) Clean with a cotton bud and ethyl alcohol if the grease stained. Be careful not to scratch the glass.
- d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Installing (attaching)

- a) Remain within the following limits when applying a static load to the package. Do not apply any load more than 0.7mm inside the outer perimeter of the glass portion, and do not apply any load or impact to limited portions. (This may cause cracks in the package.)

- b) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.

- c) The adhesive may cause the marking on the rear surface to disappear, especially in case the regulated voltage value is indicated on the rear surface. Therefore, the adhesive should not be applied to this area, and indicated values should be transferred to the other locations as a precaution.
- d) The notch of the package is used for directional index, and that can not be used for reference of fixing. In addition, the cover glass and seal resin may overlap with the notch of the package.
- e) If the lead bend repeatedly and the metal, etc., clash or rub against the package, the dust may be generated by the fragments of resin.
- f) Acrylate anaerobic adhesives are generally used to attach CCD image sensors. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives. (reference)

5) Others

- a) Do not expose to strong light (sun rays) for long periods, color filters will be discolored. When high luminance objects are imaged with the exposure level control by electronic-iris, the luminance of the image-plane may become excessive and discolor of the color filter will possibly be accelerated. In such a case, it is advisable that taking-lens with the automatic-iris and closing of the shutter during the power-off mode should be properly arranged. For continuous using under cruel condition exceeding the normal using condition, consult our company.
- b) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.
- c) The brown stain may be seen on the bottom or side of the package. But this does not affect the CCD characteristics.

Package Outline Unit: mm

16pin DIP (450mil)

1. "A" is the center of the effective image area.
2. The two points "B" of the package are the horizontal reference. The point "B" of the package is the vertical reference.
3. The bottom "C" of the package, and the top of the cover glass "D" are the height reference.
4. The center of the effective image area relative to "B" and "B'" is $(H, V) = (6.1, 5.7) \pm 0.15$ mm.
5. The rotation angle of the effective image area relative to H and V is $\pm 1^\circ$.
6. The height from the bottom "C" to the effective image area is 1.41 ± 0.10 mm. The height from the top of the cover glass "D" to the effective image area is 1.94 ± 0.15 mm.
7. The tilt of the effective image area relative to the bottom "C" is less than $50\mu\text{m}$. The tilt of the effective image area relative to the top "D" of the cover glass is less than $50\mu\text{m}$.
8. The thickness of the cover glass is 0.75mm, and the refractive index is 1.5.
9. The notches on the bottom of the package are used only for directional index, they must not be used for reference of fixing.
