

VERSACLOCK® LOW POWER CLOCK GENERATOR

IDT5P49EE601

Description

The IDT5P49EE601 is a programmable clock generator intended for low power, battery operated consumer applications. There are four internal PLLs, each individually programmable, allowing for up to six different output frequencies. The frequencies are generated from a single reference clock. The reference clock can come from either a TCXO or fundamental mode crystal. An additional 32.768kHz crystal oscillator is available to provide a real time clock or non-critical performance MHz processor clock.

The IDT5P49EE601 can be programmed through the use of the I²C interfaces. The programming interface enables the device to be programmed when it is in normal operation or what is commonly known as in system programmable. An internal EEPROM allows the user to save and restore the configuration of the device without having to reprogram it on power-up.

Each of the four PLLs has an 8-bit reference divider and a 11-bit feedback divider. This allows the user to generate four unique non-integer-related frequencies. The PLL loop bandwidth is programmable to allow the user to tailor the PLL response to the application. For instance, the user can tune the PLL parameters to minimize jitter generation or to maximize jitter attenuation.

Spread spectrum generation is supported on one of the PLLs. The device is specifically designed to work with display applications to ensure that the spread profile remains consistent for each HSYNC in order to reduce ROW noise.

There are total six 8-bit output dividers. One output bank can be configured to support LVTTTL or LVDS. All other outputs are always set to LVTTTL. The outputs are connected to the PLLs via the switch matrix. The switch matrix allows the user to route the PLL outputs to any output bank. This feature can be used to simplify and optimize the board layout. In addition, each output's slew rate and enable/disable function can be programmed.

Target Applications

- Smart Mobile Handset
- Personal Navigation Device (PND)
- Camcorder
- DSC
- Portable Game Console
- Personal Media Player

Features

- Four internal PLLs
- Internal non-volatile EEPROM
 - Internal I²C EEPROM master interface
- FAST (400kHz) mode I²C serial interfaces
- Input Frequencies
 - TCXO: 10 MHz to 40 MHz
 - Crystal: 8 MHz to 30 MHz
 - RTC Crystal: 32.768 kHz
- Output Frequency Ranges: kHz to 120 MHz
- Each PLL has an 8-bit reference divider and a 11-bit feedback-divider
- 8-bit output-divider blocks
- One of the PLLs support Spread Spectrum generation capable of configuration to pixel rate, with adjustable modulation rate and amplitude to support video clock with no visible artifacts
- I/O Standards:
 - Outputs - 1.8V/2.5V/3.3 V LVTTTL/ LVCMOS
 - Outputs - 1 pair selectable 3.3V LVDS
- 3 independent adjustable VDDO groups.
- Programmable Slew Rate Control
- Programmable Loop Bandwidth Settings
- Programmable output inversion to reduce bimodal jitter
- Individual output enable/disable
- Power-down/Sleep mode
 - 10μA max in power down mode
 - 32kHz clock output active sleep mode
 - 100μA max in sleep mode
- 1.8V VDD Core Voltage
- Available in 24pin 4x4mm QFN packages
- -40 to +85 C Industrial Temp operation

Functional Block Diagram

Note 1: OUT4A & OUT4B pair can be configured to be LVDS or two single-ended LVTTTL outputs.

Pin Assignment

Pin Descriptions

Pin Name	Pin #	I/O	Pin Type	Pin Description
OUT3	1	O	Adjustable	Configurable clock output 3. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.
OUT2	2	O	Adjustable	Configurable clock output 2. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.
SEL0	3	I	LVTTL	Configuration select pin. Weak internal pull down resistor.
VDDO1	4		Power	Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0-OUT4. VDDO1 must be greater than or equal to both VDDO2 and VDDO3.
X132k	5	I	LVTTL	32kHz CRYSTAL_IN -- Reference crystal input
X232k	6	O	LVTTL	32kHz CRYSTAL_OUT -- Reference crystal feedback.
VDDx	7		Power	Crystal oscillator power supply. Connect to 1.8V. Use filtered analog power supply if available.
GND	8		Power	Connect to Ground.
VDD	9		Power	Device power supply. Connect to 1.8V.
VDDO2	10		Power	Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0-OUT4. VDDO2 must be equal or less than VDDO1.
OUT1	11	O	Adjustable	Configurable clock output 1. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.
SEL1	12	I	LVTTL	Configuration select pin. Weak internal pull down resistor.

GND	13		Power	Connect to Ground.
VDD	14		Power	Device power supply. Connect to 1.8V.
OUT0	15	O	Adjustable	Configurable clock output 0. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.
VDDO3	16		Power	Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0-OUT4. VDDO3 must be equal or less than VDDO1.
SCLK	17	I	LVTTL	I ² C clock.
OUT4B	18	O	Adjustable	Configurable clock output 4B. Single-ended or differential when combined with OUT4A. Output voltage levels are controlled by VDDO1.
OUT4A	19	O	Adjustable	Configurable clock output 4A. Single-ended or differential when combined with OUT4B. Output voltage levels are controlled by VDDO1.
SDA	20	I/O	Open Drain	Bidirectional I ² C data.
VDD	21		Power	Device power supply. Connect to 1.8V.
GND	22		Power	Connect to Ground.
XIN/ REF	23	I	LVTTL	MHz CRYSTAL_IN -- Reference crystal input or external reference clock input.
XOUT	24	O	LVTTL	MHz CRYSTAL_OUT -- Reference crystal feedback.

Note 1: Outputs are user programmable to drive single-ended 1.8V/2.5V/3.3V LVTTL. Differential LVDS interface levels can be generated for OUT4A/OUT4B when connected to VDDO1=3.3V and registers configured appropriately. Always completely power up VDD and VDDx prior to applying VDDO power.

Note 2: Default configuration CLK1=Buffered MHz Reference output and CLK2=Buffered 32.768kHz output. All other outputs are off.

PLL Features and Descriptions

PLL Block Diagram

	Ref-Divider (D) Values	Feedback Pre-Divider (XDIV) Values	Feedback (M) Values	Programmable Loop Bandwidth	Spread Spectrum Generation Capability
PLLA	1 - 255	1 or 4 ¹	6 - 2047	Yes	No
PLLB	1 - 255	4	6 - 2047	Yes	Yes
PLLC	1 - 255	1 or 8 bit divide ²	6 - 2047	Yes	No
PLLD	1 - 255	1 or 4 ¹	6 - 2047	Yes	No

1.XDIVA or XDIVD=0, A=1. XDIVA or XDIVD=1, A=4.

2.XDIVC =0, A=1. XDIVC=1 turns on 8 bit predivide multiplier, A=FBC2[7:0]. Total feedback divide equals FBC[10:0] *FBC2[7:0].

Crystal Input (XIN/REF)

The crystal oscillators should be fundamental mode quartz crystals; overtone crystals are not suitable. Crystal frequency should be specified for parallel resonance with 50Ω maximum equivalent series resonance.

Crystal Load Capacitors

The device crystal connections should include pads for small capacitors from X1 to ground and from X2 to ground. These capacitors are used to adjust the stray capacitance of the board to match the nominally required crystal load capacitance. Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal capacitors must be connected from each of the pins X1 and X2 to ground.

The crystal capacitors are internal to the device and have an effective value of 8pF.

Reference Pre-Divider, Reference Divider, Feedback-Divider and Post-Divider

Each PLL incorporates an 8-bit reference-scaler and a 11-bit feedback divider which allows the user to generate four unique non-integer-related frequencies. PLLA and PLLD each have a feedback pre-divider that provides additional multiplication for kHz reference clock applications. Each output divider supports 8-bit post-divider. The following equation governs how the output frequency is calculated.

$$F_{OUT} = \frac{F_{IN} * \left(\frac{A * M}{D} \right)}{ODIV} \quad (\text{Eq. 2})$$

Where F_{IN} is the reference frequency, A is the feedback pre-divider value, M is the feedback-divider value, D is the reference divider value, ODIV is the total post-divider value, and F_{OUT} is the resulting output frequency. Programming any of the dividers may cause glitches on the outputs.

SPREAD SPECTRUM GENERATION (PLL B)

PLL B has spread spectrum generation capability, which users have the option of turning on and off. Spread spectrum profile, frequency, and spread are fully programmable (within limits). The programmable spread spectrum generation parameters are NC[10:0], MOD[12:0], and NSS[10:0] bits. To enable spread spectrum, set SSEN_B=0.

The spread spectrum circuitry was specifically developed to accommodate video display applications. The spread modulation frequency can be defined to exactly equal the horizontal line frequency (HSYNC)

NC[10:0]

These bits are used to determine the number of pulses per spread spectrum cycle. For video applications, NC is the number of pixels on the horizontal display row (or integer multiple of displayed pixels in a row). By matching the spread period to the screen, no tearing or “shimmer” will be apparent.

NC must be an even number to insure that the upward spread transition has the same number of steps as the downward spread transition.

For non-video applications, this can also be seen as the number of clock cycles for a complete spread spectrum period.

MOD[12:0]

These bits relate the VCO frequency to the target average spread output frequency (F_{MID}).

$$F_{MID} = (F_{VCO}) / 8$$

$$F_{MAX} = F_{MID} + (SS\% * F_{MID})$$

$$F_{MIN} = F_{MID} - (SS\% * F_{MID})$$

$$MOD = (F_{REF} * NC) / (2 * F_{MID})$$

NSS[10:0]

These bits control the amplitude of the spread modulation.

$$NSS = (NC / 2) + (NC / 8) * (F_{MAX} - F_{MIN}) / F_{MID}$$

Modulation frequency:

$$F_{MOD} = F_{MID} / NC \text{ (Eq. 11)}$$

Video Example

$F_{REF} = 27 \text{ MHz}$, $F_{OUT} = 27 \text{ MHz}$, 640 pixels per line, center spread of $\pm 1\%$. Using $F_{VCO} = 432 \text{ MHz}$, find the necessary spread spectrum register settings.

$$F_{MID} = F_{VCO} / 8$$

$$NC = 640 \text{ (integer number of spread periods/screen)}$$

$$MOD = (25 \text{ MHz} * 640) / (2 * 54 \text{ MHz}) = 160$$

$$NSS = (640/2) + (640/8) * (27.27 \text{ MHz} - 26.73 \text{ MHz}) / 27 \text{ MHz} = 321.$$

$$F_{MOD} = 27 \text{ MHz} / 640 = 11.8 \text{ kHz}.$$

Non-Video Example

$F_{REF} = 25 \text{ MHz}$, $F_{OUT} = 27 \text{ MHz}$, 31.25 kHz modulation rate, center spread of $\pm 1\%$. Find the necessary spread spectrum register settings.

$$F_{MID} = F_{VCO} / 8$$

$$F_{MOD} = 31.25 \text{ kHz} = 50.625 \text{ MHz} / NC.$$

$$NC = 1620$$

$$MOD = (25 \text{ MHz} * 1620) / (2 * 50.625 \text{ MHz}) = 400$$

$$NSS = (1620/2) + (1620/8) * (27.27 \text{ MHz} - 26.73 \text{ MHz}) / 27 \text{ MHz} = 814.$$

VSYNC, HSYNC, DOT_CLK – Modulation Rate Relationship

Zero capacitor (C_z) = 280pF

Pole capacitor (C_p) = 30pF

Charge pump (I_p) = IP#[2:0] μ A

VCO gain (K_{vco}) = 300MHz/V * 2π

LOOP FILTER

The loop filter for each PLL can be programmed to optimize the jitter performance. The low-pass frequency response of the PLL is the mechanism that dictates the jitter transfer characteristics. The loop bandwidth can be extracted from the jitter transfer. A narrow loop bandwidth is good for jitter attenuation while a wide loop bandwidth is best for low jitter generation. The specific loop filter components that can be programmed are the resistor via the RZ[4:0] bits, zero capacitor via the CZ[2:0] bits, pole capacitor via the CP[1:0] bits, and the charge pump current via the IP#[2:0] bits.

The following equations govern how the loop filter is set:

PLL Loop Bandwidth:

Charge pump gain ($K\phi$) = $I_p / 2\pi$

VCO gain (K_{VCO}) = $950\text{MHz/V} * 2\pi$

M = Total multiplier value (See the PRE-SCALERS, FEEDBACK-DIVIDERS, POST-DIVIDERS section for more detail)

$$\omega_c = (R_z * K\phi * K_{VCO} * C_z) / (M * (C_z + C_p))$$

$$F_c = \omega_c / 2\pi$$

Note, the phase/frequency detector frequency (F_{PFD}) is typically seven times the PLL closed-loop bandwidth (F_c) but too high of a ratio will reduce your phase margin thus compromising loop stability.

To determine if the loop is stable, the phase margin (ϕ_m) would need to be calculated as follows.

Phase Margin:

$$\omega_z = 1 / (R_z * C_z)$$

$$\omega_p = (C_z + C_p) / (R_z * C_z * C_p)$$

$$\phi_m = (360 / 2\pi) * [\tan^{-1}(\omega_c / \omega_z) - \tan^{-1}(\omega_c / \omega_p)]$$

To ensure stability in the loop, the phase margin is recommended to be $> 60^\circ$ but too high will result in the lock time being excessively long. Certain loop filter parameters would need to be compromised to not only meet a required loop bandwidth but to also maintain loop stability.

Example

$F_c = 150\text{KHz}$ is the desired loop bandwidth. The total $A*M$ value is 160. The ζ (damping factor) target should be 0.7, meaning the loop is critically damped. Given F_c and $A*M$, an optimal loop filter setting needs to be solved for that will meet both the PLL loop bandwidth and maintain loop stability.

Choose a mid-range charge pump from register table

$$I_{cp} = 11.9\mu\text{A}.$$

$$K\phi * K_{VCO} = 300\text{MHz/V} * 40\mu\text{A} = 12000\text{A/Vs}$$

$$\omega_c = 2\pi * F_c = 9.42 \times 10^5 \text{ s}^{-1}$$

$$\omega_p = (C_z + C_p) / (R_z * C_z * C_p) = \omega_z (1 + C_z / C_p)$$

Solving for R_z , the best possible value $R_z = 30\text{k}\Omega$ ($RZ[1:0] = 10$) gives

$$\zeta = 1.2$$

Solving back for the PLL loop bandwidth, $F_c = 149\text{kHz}$.

The phase margin must be checked for loop stability.

$$\phi_m = (360 / 2\pi) * [\tan^{-1}(9.42 \times 10^5 \text{ s}^{-1} / 1.19 \times 10^5 \text{ s}^{-1}) - \tan^{-1}(9.42 \times 10^5 \text{ s}^{-1} / 1.23 \times 10^6 \text{ s}^{-1})] = 45^\circ$$

The phase margin would be acceptable with a fairly stable loop.

SEL[1:0] Function

The IDT5P49EE601 can support up to three unique configurations. Users may pre-programmed all these configurations, and select the configurations using SEL[1:0] pins. Alternatively, users may use I2C interface to configure these registers on- the-fly.

Power Down/Sleep Mode is selected by the No_PD bit.
No_PD=0 enables Power Down mode with no outputs.
No_PD=1 enables sleep mode with 32kHz output on OUT2.

SEL1	SEL0	Configuration Selections
0	0	Power Down/Sleep Mode
0	1	Select CONFIG0
1	0	Select CONFIG1
1	1	Select CONFIG2

Configuration OUTx IO Standard

Users can configure the individual output IO standard from a single 3.3V power supply. Each output can support 1.8V/

2.5V or 3.3V LVCMOS. Output pair OUT4A/OUT4B can be configured to support an LVDS output. For LVDS support, VDDO1 must be set to 3.3V. VDDO1 must have the highest voltage of any pin on the device. VDDO2 and VDDO3 may have any value between 1.8V and VDDO1.

Programming the Device

I²C may be used to program the IDT5P49EE601.

– Device (slave) address = 7'b1101010

I²C Programming

The IDT5P49EE601 is programmed through an I2C-Bus serial interface, and is an I2C slave device. The read and write transfer formats are supported. The first byte of data after a write frame to the correct slave address is interpreted as the register address; this address auto-increments after each byte written or read.

The frame formats are shown in the following illustration.

Framing

R/W
0 - Slave will be written by master
1 - Slave will be read by master

ACK from Slave

The first byte transmitted by the Master is the Slave Address followed by the R/W bit. The Slave acknowledges by sending a "1" bit.

First Byte Transmitted on I²C Bus

External I²C Interface Condition

KEY:

☐ From Master to Slave

☒ From Master to Slave, but can be omitted if followed by the correct sequence

Normally data transfer is terminated by a STOP condition generated by the Master. However, if the Master still wishes to communicate on the bus, it can generate a repeated START condition, and address another Slave address without first generating a STOP condition.

☐ From Slave to Master

SYMBOLS:

ACK - Acknowledge (SDA LOW)

NACK - Not Acknowledge (SDA HIGH)

Sr - Repeated Start Condition

S - START Condition

P - STOP Condition

EEPROM Interface

The IDT5P49EE601 can store its configuration in an internal EEPROM. The contents of the device's internal programming registers can be saved to the EEPROM by issuing a save instruction (ProgSave) and can be loaded back to the internal programming registers by issuing a restore instruction (ProgRestore).

To initiate a save or restore using I²C, only two bytes are transferred. The Device Address is issued with the read/write bit set to "0", followed by the appropriate command code. The save or restore instruction executes

after the STOP condition is issued by the Master, during which time the IDT5P49EE601 will not generate Acknowledge bits. The IDT5P49EE601 will acknowledge the instructions after it has completed execution of them. During that time, the I²C bus should be interpreted as busy by all other users of the bus.

On power-up of the IDT5P49EE601, an automatic restore is performed to load the EEPROM contents into the internal programming registers. The IDT5P49EE601 will be ready to accept a programming instruction once it acknowledges its 7-bit I²C address.

Progwrite

S	Address	R/W	ACK	Command Code	ACK	Register	ACK	Data	ACK	P
	7-bits	0	1-bit	8-bits: xxxxxx00	1-bit	8-bits	1-bit	8-bits	1-bit	

Progwrite Command Frame

Writes can continue as long as a Stop condition is not sent and each byte will increment the register address.

Progreed

Note: If the expected read command is not from the next higher register to the previous read or write command, then set a known “read” register address prior to a read operation by issuing the following command:

S	Address	R/W	ACK	Command Code	ACK	Register	ACK	P
	7-bits	0	1-bit	8-bits: xxxxxx00	1-bit	8-bits	1-bit	

Prior to Progreed Command Set Register Address

The user can ignore the STOP condition above and use a repeated START condition instead, straight after the slave acknowledgement bit (i.e., followed by the Progreed command):

Sr	Address	R/W	ACK	ID Byte	ACK	Data_1	ACK	Data_2	ACK	Data_last	NACK	P
	7-bits	1	1-bit	8 bits	1-bit	8-bits	1-bit	8-bits	1-bit	8-bits	1-bit	

Progreed Command Frame

Progsave

S	Address	R/W	ACK	Command Code	ACK	P
	7-bits	0	1-bit	8-bits:xxxxxx01	1-bit	

Note:

PROGWRITE is for writing to the IDT5P49EE601 registers.

PROGREAD is for reading the IDT5P49EE601 registers.

PROGSAVE is for saving all the contents of the IDT5P49EE601 registers to the EEPROM.

PROGRESTORE is for loading the entire EEPROM contents to the IDT5P49EE601 registers.

Progrestore

S	Address	R/W	ACK	Command Code	ACK	P
	7-bits	0	1-bit	8-bits:xxxxxx10	1-bit	

During PROGRESTORE, outputs will be turned off to ensure that no improper voltage levels are experienced before initialization.

I²C Bus DC Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V _{IH}	Input HIGH Level		0.7xVDD		5.5	V
V _{IL}	Input LOW Level				0.3xVDD	V
V _{HYS}	Hysteresis of Inputs		0.05xVDD			V
I _{IN}	Input Leakage Current	V _{DD} = 0V			±1.0	μA
V _{OL}	Output LOW Voltage	I _{OL} = 3 mA			0.4	V

I²C Bus AC Characteristics for Standard Mode¹

Symbol	Parameter	Min	Typ	Max	Unit
F _{SCLK}	Serial Clock Frequency (SCL)	0		100	kHz
t _{BUF}	Bus free time between STOP and START	4.7			μs
t _{SU:START}	Setup Time, START	4.7			μs
t _{HD:START}	Hold Time, START	4			μs
t _{SU:DATA}	Setup Time, data input (SDA)	250			ns
t _{HD:DATA}	Hold Time, data input (SDA) ¹	0			μs
t _{OVD}	Output data valid from clock			3.45	μs
C _B	Capacitive Load for Each Bus Line			400	pF
t _R	Rise Time, data and clock (SDA, SCLK)			1000	ns
t _F	Fall Time, data and clock (SDA, SCLK)			300	ns
t _{HIGH}	HIGH Time, clock (SCLK)	4			μs
t _{LOW}	LOW Time, clock (SCLK)	4.7			μs
t _{SU:STOP}	Setup Time, STOP	4			μs

1) No activity is allowed on I²C lines until VDD>1.62V.

2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IH}MIN of the SCLK signal) to bridge the undefined region of the falling edge of SCLK.

I²C Bus AC Characteristics for Fast Mode¹

Symbol	Parameter	Min	Typ	Max	Unit
F _{SCLK}	Serial Clock Frequency (SCL)	0		400	kHz
t _{BUF}	Bus free time between STOP and START	1.3			μs
t _{SU:START}	Setup Time, START	0.6			μs
t _{HD:START}	Hold Time, START	0.6			μs
t _{SU:DATA}	Setup Time, data input (SDA)	100			ns
t _{HD:DATA}	Hold Time, data input (SDA) ¹	0			μs
t _{OVD}	Output data valid from clock			0.9	μs
C _B	Capacitive Load for Each Bus Line			400	pF
t _R	Rise Time, data and clock (SDA, SCL)	20 + 0.1xC _B		300	ns
t _F	Fall Time, data and clock (SDA, SCL)	20 + 0.1xC _B		300	ns
t _{HIGH}	HIGH Time, clock (SCL)	0.6			μs
t _{LOW}	LOW Time, clock (SCL)	1.3			μs
t _{SU:STOP}	Setup Time, STOP	0.6			μs

1) No activity is allowed on I²C lines until VDD>1.62V.

2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IH}MIN of the SCL signal) to bridge the undefined region of the falling edge of SCL.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the IDT5P49EE601. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Symbol	Description	Max	Unit
V _{DD}	Internal Power Supply Voltage	-0.5 to +4.6	V
V _I	Input Voltage	-0.5 to +4.6	V
V _O	Output Voltage (not to exceed 4.6 V)	-0.5 to V _{DD} +0.5	V
T _J	Junction Temperature	150	°C
T _{STG}	Storage Temperature	-65 to +150	°C

Recommended Operation Conditions

Symbol	Parameter	Min	Typ	Max	Unit
V _{DD}	Power supply voltage for VDD closest to LVTTTL and core	3	3.3	3.6	V
	Power supply voltage for VDD closest to LVDS outputs	3.135	3.3	3.465	
T _A	Operating temperature, ambient	-40		+85	°C
C _{LOAD_OUT}	Maximum load capacitance (3.3V LVTTTL only)			15	pF
C _{LOAD_OUT}	Maximum load capacitance (1.8V or 2.5V LVTTTL only)			8	pF
F _{IN}	External reference crystal	8		30	MHz
	External reference clock CLKIN	1		40	
t _{PU}	Power up time for all V _{DD} s to reach minimum specified voltage (power ramps must be monotonic)	0.05		5	ms

Capacitance (T_A = +25 °C, f = 1 MHz, V_{IN} = 0V)

Symbol	Parameter	Min	Typ	Max	Unit
C _{IN}	Input Capacitance		3		pF
Crystal Specifications					
XTAL_FREQ	Crystal frequency	8		30	MHz
XTAL_MIN	Minimum crystal load capacitance		TBD		pF

ΔV_{OS}	Change in V_{OS} between Complimentary Output States			50	mV
I_{OS}	Outputs Short Circuit Current, V_{OUT+} or $V_{OUT-} = 0V$ or V_{DD}		TBD	TBD	mA
I_{OSD}	Differential Outputs Short Circuit Current, $V_{OUT+} = V_{OUT-}$		TBD	TBD	mA

Power Supply Characteristics for LVDS Outputs ¹

Symbol	Parameter	Test Conditions ²	Typ	Max	Unit
I_{DDQ}	Quiescent VDD Power Supply Current	REF = LOW Outputs enabled, all outputs unloaded	TBD	TBD	mA
I_{DDD}	Dynamic VDD Power Supply Current per Output	VDD = Max., $C_L = 0pF$	TBD	TBD	$\mu A/MHz$
I_{TOT}	Total Power VDD Supply Current	$F_{REFERENCE\ CLOCK} = 25\ MHz$, $C_L = 5\ pF$	TBD	TBD	mA

1) OUT4A and OUT4B are toggling. Other outputs are powered down.

2) The termination resistors are excluded from these measurements.

AC Timing Electrical Characteristics

(Spread Spectrum Generation = OFF)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Units
f_{IN}	Input Frequency	Input Frequency Limit (CLKIN)	1 ¹		40	MHz
1 / t1	Output Frequency	Single Ended Clock output limit (LVTTL) 3.3V	0.001		120	MHz
		Single Ended Clock output limit (LVTTL) 2.5V			110	MHz
		Single Ended Clock output limit (LVTTL) 1.8V			100	MHz
		Differential Clock output limit (LVDS)			150	MHz
f_{VCO}	VCO Frequency	VCO operating Frequency Range	100		500	MHz
f_{PFD}	PFD Frequency	PFD operating Frequency Range	0.5 ¹		20	MHz
f_{BW}	Loop Bandwidth	Based on loop filter resistor and capacitor values	0.01		10	MHz
t2	Input Duty Cycle	Duty Cycle for Input	40		60	%
t3	Output Duty Cycle	Measured at VDD/2	45		55	%
t4	Slew Rate, SLEWx(bits) = 00	Single-Ended 3.3V LVCMOS Output clock rise and fall time, 20% to 80% of VDD (Output Load = 7 pF)		3.5		V/ns
	Slew Rate, SLEWx(bits) = 01	Single-Ended 3.3V LVCMOS Output clock rise and fall time, 20% to 80% of VDD (Output Load = 7 pF)		2.75		
	Slew Rate, SLEWx(bits) = 10	Single-Ended 3.3V LVCMOS Output clock rise and fall time, 20% to 80% of VDD (Output Load = 7 pF)		2		
	Slew Rate, SLEWx(bits) = 11	Single-Ended 3.3V LVCMOS Output clock rise and fall time, 20% to 80% of VDD (Output Load = 7 pF)		1.25		
t5	Rise Times	LVDS, 20% to 80%		600		ps
	Fall Times			600		
t7	Clock Jitter	Peak-to-peak period jitter, CLK outputs measured at VDD/2; $f_{PFD} \geq 10$ MHz Single output frequency only.			100	ps
		Peak-to-peak period jitter, CLK outputs measured at VDD/2; $f_{PFD} \geq 10$ MHz Multiple output frequencies switching.			200	ps
t6	Output Skew	Skew between any output (Same freq and IO type, FOUT >10MHz)			200	ps
t7	Lock Time	PLL Lock Time from Power-up (using MHz reference clock) ²		5	20	ms
		PLL Lock Time from Power-up using 32.768kHz reference clock)		1	3	s

1) Input clock (square wave) may be used at 1 MHz.

2) Time from supply voltage crosses VDD=1.62V to PLLs are locked.

Spread Spectrum Generation Specifications

Symbol	Parameter	Description	Min	Typ	Max	Unit
f _{IN}	Input Frequency	Input Frequency Limit	1 ¹		40	MHz
f _{MOD}	Mod Frequency	Modulation Frequency	32		120	kHz
f _{SPREAD}	Spread Value	Amount of Spread Value (programmable) - Down Spread	Programmable			%f _{OUT}
		Amount of Spread Value (programmable) - Center Spread	Programmable			

Note 1: Practical lower frequency is determined by loop filter settings.

Test Circuits and Conditions ¹

NOTE:

1. All VDD pins must be tied together.

Test Circuits for DC Outputs

Other Termination Scheme (Block Diagram)

LVTTTL: ~7pF for each output

LVDS: 100Ω between differential outputs with 5pF

Marking Diagram (NL24)

Notes:

1. "Z" is the device step (1 to 2 characters).
2. YYWW is the last two digits of the year and week that the part was assembled.
3. "\$" is the assembly mark code.
4. "G" after the two-letter package code designates RoHS compliant package.
5. "I" at the end of part number indicates industrial temperature range.
6. Bottom marking: country of origin if not USA.

Thermal Characteristics for 24QFN

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Units
Thermal Resistance Junction to Ambient	θ_{JA}	Still air		29.1		°C/W
	θ_{JA}	1 m/s air flow		22.8		°C/W
	θ_{JA}	2.5 m/s air flow		21.0		°C/W
Thermal Resistance Junction to Case	θ_{JC}			41.8		°C/W

Package Outline and Package Dimensions (24-pin 4mm x 4mm QFN)

Package dimensions are kept current with JEDEC Publication No. 95

Symbol	Millimeters	
	Min	Max
A	0.80	1.00
A1	0	0.05
A3	0.25 Reference	
b	0.18	0.30
e	0.50 BASIC	
N	24	
N_D	6	
N_E	6	
D x E BASIC	4.00 x 4.00	
D2	2.3	2.55
E2	2.3	2.55
L	0.30	0.50

Ordering Information

Part / Order Number	Marking	Shipping Packaging	Package	Temperature
5P49EE601NLGI	See Page 23	Tubes	24pin VFQFPN	-40 to +85° C
5P49EE601NLGI8	See Page 23	Tape and Reel	24pin VFQFPN	-40 to +85° C

Parts that are ordered with a "G" after the two-letter package code are the Pb-Free configuration and are RoHS compliant.

While the information presented herein has been checked for both accuracy and reliability, Integrated Device Technology (IDT) assumes no responsibility for either its use or for the infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial applications. Any other applications such as those requiring extended temperature range, high reliability, or other extraordinary environmental requirements are not recommended without additional processing by IDT. IDT reserves the right to change any circuitry or specifications without notice. IDT does not authorize or warrant any IDT product for use in life support devices or critical medical instruments.

Revision History

Rev.	Originator	Date	Description of Change
--	R.Willner	10/29/09	Preliminary Datasheet release.
A	R.Willner	11/20/09	No_PD bit inclusion - 32kHz clock on/off in Config 00.
B	R.Willner	3/25/10	Typographical changes. Correct spread spectrum calculations.
C	R.Willner	6/11/10	Typographical changes. Default configuration.
