

### General Description

The IDT8T49N524I is an eight output programmable any-rate dual clock generator with selectable LVDS or LVPECL outputs. Both clock generators use Fractional Output Dividers to be able to generate output frequencies that are independent of each other and independent of the input frequency. Output frequencies for both clock generators are generated from a single crystal or reference clock.

Clock Generator A supports three different factory-programmed default frequencies that can be selected from using only the FSEL control pins. Alternatively any desired output frequency can be programmed over the I<sup>2</sup>C serial port. The chosen output frequency is then driven out the QA0 to QA3 outputs.

Clock Generator B supports a single factory-programmed default frequency. It can also be programmed for any output frequency via the serial port. The output frequency is driven out the QB0 to QB3 outputs.

Some examples of frequency configurations that can be achieved are shown in Table 5A. Please consult IDT for programming software that can be used to determine the required settings for any desired configuration.

Excellent phase noise performance is achieved with IDT's fourth Generation FemtoClock® NG PLL technology, which delivers sub-0.5ps RMS phase jitter in the integer divide mode.

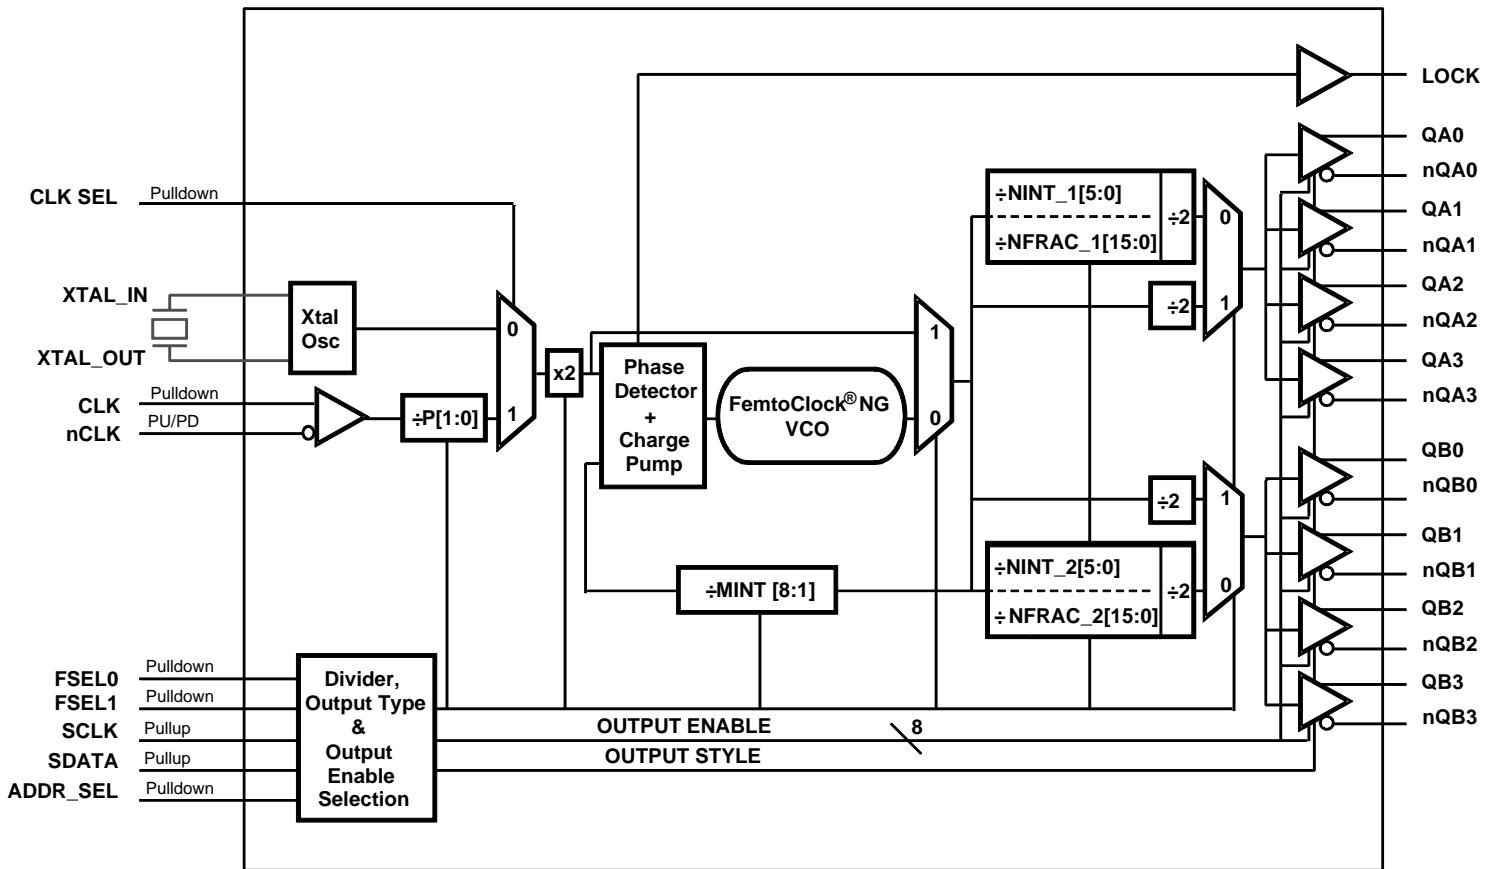

### Features

- Fourth Generation FemtoClock® NG PLL technology
- Eight outputs selectable as LVPECL or LVDS
- Input selectable: fundamental mode crystal or clock reference
- Supports fundamental mode crystals from 10MHz - 40MHz
- CLK, nCLK input pair can accept the following differential input levels: LVPECL, LVDS, HCSL
- Input frequencies from 5MHz up to 800MHz
- Two independent output frequencies can be generated
- Output frequencies independent of each other and of input
- Output frequencies from 15.234MHz - 645MHz, and 975MHz - 1290MHz, (See Table 5D for details)
- RMS phase jitter at 125MHz (12kHz - 20MHz): 0.282ps (typical)
- RMS phase jitter at 156.25MHz (12kHz - 20MHz): 0.278ps (typical)
- Full 2.5V or 3.3V power supply
- I<sup>2</sup>C programming interface
- -40°C to 85°C ambient operating temperature
- Lead-free (RoHS 6) packaging
- V<sub>CC</sub> / V<sub>CCA</sub> / V<sub>CCO</sub>  
3.3V / 3.3V / 3.3V  
3.3V / 3.3V / 2.5V (LVPECL only)  
2.5V / 2.5V / 2.5V

### Pin Assignment

### Block Diagram

## Pin Description & Characteristics

**Table 1. Pin Descriptions**

Number	Name	Type		Description
1, 2	QA0, nQA0	Output		Clock generator A differential output pair. LVPECL or LVDS interface levels.
3, 4	QA1, nQA1	Output		Clock generator A differential output pair. LVPECL or LVDS interface levels.
5	V <sub>CCO_A</sub>	Power		Clock generator A output supply pin.
6, 7	QA2, nQA2	Output		Clock generator A differential output pair. LVPECL or LVDS interface levels.
8, 9	QA3, nQA3	Output		Clock generator A differential output pair. LVPECL or LVDS interface levels.
10, 13, 18, 21, 31, 34, 37, 40	V <sub>EE</sub>	Power		Negative supply pins.
11, 12	XTAL_IN XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.
14	CLK	Input	Pulldown	Non-inverting differential clock input.
15	nCLK	Input	Pullup/ Pulldown	Inverting differential clock input. Internal resistor bias to V <sub>CC</sub> /2.
16, 20	FSEL0, FSEL1	Input	Pulldown	Frequency select pins. See Table 4A for frequency selection. LVCMOS/LVTTL interface levels.
17	ADDR_SEL	Input	Pulldown	I <sup>2</sup> C Address select pin. LVCMOS/LVTTL interface levels.
19, 38	V <sub>CC</sub>	Power		Core supply pins.
22, 23	nQB3, QB3	Output		Clock generator B differential output pair. LVPECL or LVDS interface levels.
24, 25	nQB2, QB2	Output		Clock generator B differential output pair. LVPECL or LVDS interface levels.
26	V <sub>CCO_B</sub>	Power		Clock generator B output supply pin.
27, 28	nQB1, QB1	Output		Clock generator B differential output pair. LVPECL or LVDS interface levels.
29, 30	nQB0, QB0	Output		Clock generator B differential output pair. LVPECL or LVDS interface levels.
32	SCLK	Input	Pullup	I <sup>2</sup> C Clock Input. LVCMOS/LVTTL interface levels.
33	SDATA	Input/Output	Pullup	I <sup>2</sup> C Data Input. Input: LVCMOS/LVTTL interface levels. Output: Open Drain.
35	V <sub>CCA</sub>	Power		Analog supply pin.
36	LOCK	Output		PLL Lock Indicator.
39	CLK_SEL	Input	Pulldown	Input source control pin. LVCMOS/LVTTL interface levels. 0 = Crystal is input source (default) 1 = CLK, nCLK input reference clock is input source

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

**Table 2. Pin Characteristics**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			3.5		pF
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ
R <sub>PULLUP</sub>	Input Pullup Resistor			51		kΩ

## Function Tables

**Table 4A. Frequency Select Table**

FSEL1	FSEL0	Pre-scaler Ratio	Feedback Divider Ratio	QAn Operation		QBn Operation	
0 (default)	0 (default)	P	MINT0	NINTA_0	NFRACA_0	NINTB	NFRACB
0	1	P	MINT1	NINTA_1	NFRACA_1	NINTB	NFRACB
1	0	P	MINT2	NINTA_2	NFRACA_2	NINTB	NFRACB
1	1	Reserved					

**Table 4B. I<sup>2</sup>C Register Function Descriptions**

Bits	Name	Function
MINTn[7:0]	Integer Feedback Divider Register n (n = 0...2)	Sets the integer feedback divider value. See Table 5B for the feedback divider coding.
P[1:0]	Input Divider Register	Sets the PLL input divider. The divider value has the range of 1, 2, 4 and 8. See Table 5C for the divider coding.
NINTA_n[5:0]	Output Divider A - Integer Portion n (n = 0...2)	Sets the integer portion of the output divider A. See Table 5D for the output divider coding.
NFRACA_n[15:0]	Output Divider A - Fractional Portion (n = 0...2)	Sets the fractional portion of the output divider A. See Table 5D for the output divider coding.
NINTB[5:0]	Output Divider B - Integer Portion	Sets the integer portion of the output divider B. See Table 5D for the output divider coding.
NFRACB[15:0]	Output Divider B - Fractional Portion	Sets the fractional portion of the output divider B. See Table 5D for the output divider coding.
CPn[1:0]	PLL Bandwidth n (n = 0...2)	Sets the FemtoClock <sup>®</sup> NG PLL Charge Pump current to support the selected operating frequency. See Table 5E.
OE_Qxx	Output Enable	Sets the desired output to Active or High impedance. 0 = Output is high-impedance (default) 1 = Output is active.
LVDS_SEL	Output Style	Selects differential output style 0 = LVPECL (default) 1 = LVDS
PLL_BYPASS	PLL Bypass	Bypasses PLL. Input to phase detector is routed through output dividers A and B to the output fanout buffers. Dividers should be programmed for integer divide operation (DIVA_INT = DIVB_INT = 0) for proper operation.
DOUBLER_ENABLE	Input Doubler	Enables the input frequency doubler. 0 = Input frequency presented directly to PLL 1 = Input frequency doubled before PLL (default)
DIVA_BYPASS	Bypass Output Divider A	Bypasses output divider A. QAn output frequency is VCO/2.
DIVB_BYPASS	Bypass Output Divider B	Bypasses output divider B. QBn output frequency is VCO/2.
DIVA_INT	Divider A Integer Mode	Disables fractional portion of divider A. Setting this bit will provide better phase noise performance in cases where the fractional portion is 0.
DIVB_INT	Divider B Integer Mode	Disables fractional portion of divider B. Setting this bit will provide better phase noise performance in cases where the fractional portion is 0.

## Frequency Configuration

The IDT8T49N524I is capable of being loaded with up to three different frequency configurations. Use of the FSEL[1:0] inputs allows a user to select from any of those three configurations at any time. The three frequency configurations may be pre-loaded at the factory or can be setup at any time over the I<sup>2</sup>C serial port. Table 5A shows a number of example configurations.

It is recommended to use the IDT8T49N524I Configuration SW to generate the desired configurations for the device.

**Table 5A. Frequency Configuration Examples**

Output Frequencies (MHz)	Input or Crystal Frequency (MHz)	Input Divider P	Effective Feedback Divider Ratio M	VCO Frequency (MHz) $f_{VCO}$	Effective Output Divider Ratio N
62.5	25	1	100	2500	40

**Table 5B. Feedback Divider MINT<sub>n</sub> Coding**

Register Bit	Feedback Divide Ratio M
MINT <sub>n</sub> [7:0]	
000000xx	Do Not Use
0000100	8
0000101	10
0000110	12
0000111	14
00001000 thru 11111111	16 thru 510

**Table 5C. Input Pre-scaler (P) Coding**

Register Bit		Input Pre-scaler Divide Ratio P
P1	P0	
0	0	1
0	1	2
1	0	4
1	1	8

**Table 5D. Output Divider NINT<sub>x</sub> and NFRAC<sub>x</sub> Coding**

Frequency Divider N	Output Frequency		Register Bit
	f <sub>MIN</sub> (MHz)	f <sub>MAX</sub> (MHz)	NINT <sub>x</sub> [5:0]
	Do Not Use		00000x
2	975	1290	xxxxxx (NOTE 2)
4	487.5	645	000010
6	325	430	000011
8 – 9.99999999 (NOTE 1)	195	322.5	000100
N – N + 1.99999999	1950 / (N + 1.99999999)	2580 / N	...
126 - 127.99999999	15.234	20.476	111111

NOTE: When operating in Integer-mode, set NFRAC<sub>x</sub> = 0, DIVA\_INT = 1, and NINT<sub>x</sub> to desired output frequency configurations.

NOTE 1: When operating in fractional-mode, output frequency is limited to 322.5MHz. NFRAC<sub>x</sub> must be set to 0 if NINT<sub>x</sub> = 000010 or 000011.

NOTE 2: The output divider is bypassed to generate frequencies in this range on the output. Set DIV<sub>x</sub>\_INT and DIV<sub>x</sub>\_BYPASS bits for the desired output divider (A or B) for a ÷2 operation on that output bank.

**Table 5E. Charge Pump CP<sub>n</sub>[1:0] Settings**

Register Bit		Feedback Divider (M) Value Range	
CP <sub>n</sub> [1]	CP <sub>n</sub> [0]	Minimum	Maximum
0	0	16	48
0	1	49	100
1	0	101	192
1	1	193	510

NOTE: FemtoClock<sup>®</sup> NG PLL stability is only guaranteed over the feedback divider ranges listed in Table 5B.

## Power-up Default Configuration Description

The IDT8T49N524I supports a variety of options such as different output styles, number of programmed default frequencies, output enable and operating temperature range. The device options and default frequencies must be specified at the time of order and are programmed by IDT prior to shipment. The document, *Programmable FemtoClock® NG Product Ordering Guide* specifies the available order codes.

Other order codes with respective programmed frequencies are available from IDT upon request. After power-up changes to the output frequencies, and state of outputs, active or high impedance, are controlled by FSEL[1:0] or the I<sup>2</sup>C interface.

## Serial Interface Configuration Description

The IDT8T49N524I has an I<sup>2</sup>C-compatible configuration interface to access any of the internal registers (Table 3) for frequency and PLL parameter programming. The IDT8T49N524I acts as a slave device on the I<sup>2</sup>C bus and has the address 0b110111x, where x is set by the value on ADDR\_SEL input. (See Tables 6A & 6B). The interface accepts byte-oriented block write and block read operations. An address byte (P) specifies the register address (Table 3) as the byte position of the first register to write or read. Data bytes (registers) are accessed in sequential order from the lowest to the highest byte

(most significant bit first, see Table 6C, 6D). Read and write block transfers can be stopped after any complete byte transfer. It is recommended to terminate the I<sup>2</sup>C read or write transfer after accessing byte #23 by sending a stop command.

For full electrical I<sup>2</sup>C compliance, it is recommended to use external pull-up resistors for SDATA and SCLK. The internal pull-up resistors have a size of 50KΩ typical.

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltages, $V_{CC}$ , $V_{CCA}$ , $V_{CCO\_A}$ , $V_{CCO\_B}$	3.6V
Inputs, $V_I$ XTAL_IN Other Input	0V to 2V -0.5V to $V_{CC} + 0.5V$
Outputs, $I_O$ (LVPECL) Continuous Current Surge Current	50mA 100mA
Outputs, $I_O$ (LVDS) Continuous Current Surge Current	10mA 15mA
Outputs, $I_O$ (LVCMOS) Continuous Current (LOCK) Continuous Current (SDATA) Surge Current (all)	12mA 10mA 22mA
Package Thermal Impedance, $\theta_{JA}$	32.4°C/W (0 mps)
Storage Temperature, $T_{STG}$	-65°C to 150°C

### Recommendations for Unused Input and Output Pins

#### Inputs:

##### Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL\_IN and XTAL\_OUT can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from XTAL\_IN to ground.

##### CLK/nCLK Inputs

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from CLK to ground. It is recommended that CLK, nCLK be left unconnected in frequency synthesizer mode.

##### LVC MOS Control Pins

All control pins have internal pullup or pulldown resistors; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

#### Outputs:

##### LVPECL Outputs

All unused LVPECL output pairs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

##### LVDS Outputs

All unused LVDS output pairs can be either left floating or terminated with 100 $\Omega$  across. If they are left floating there should be no trace attached.

## Wiring the Differential Input to Accept Single-Ended Levels

Figure 1 shows how a differential input can be wired to accept single ended levels. The reference voltage  $V_1 = V_{CC}/2$  is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the  $V_1$  in the center of the input voltage swing. For example, if the input clock swing is 2.5V and  $V_{CC} = 3.3V$ , R1 and R2 value should be adjusted to set  $V_1$  at 1.25V. The values below are for when both the single ended swing and  $V_{CC}$  are at the same voltage. This configuration requires that the sum of the output impedance of the driver ( $R_o$ ) and the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission line impedance.

For most 50Ω applications, R3 and R4 can be 100Ω. The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however  $V_{IL}$  cannot be less than -0.3V and  $V_{IH}$  cannot be more than  $V_{CC} + 0.3V$ . Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

Figure 1. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

## Overdriving the XTAL Interface

The XTAL\_IN input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XTAL\_OUT pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/nS. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise. *Figure 2A* shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver ( $R_o$ ) and the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This

can be done in one of two ways. First,  $R_1$  and  $R_2$  in parallel should equal the transmission line impedance. For most 50 $\Omega$  applications,  $R_1$  and  $R_2$  can be 100 $\Omega$ . This can also be accomplished by removing  $R_1$  and changing  $R_2$  to 50 $\Omega$ . The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver. *Figure 2B* shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XTAL\_IN input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

**Figure 2A. General Diagram for LVCMOS Driver to XTAL Input Interface**

**Figure 2B. General Diagram for LVPECL Driver to XTAL Input Interface**

### 3.3V Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. *Figures 3A to 3E* show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only. Please consult

with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 3A, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

**Figure 3A. CLK/nCLK Input Driven by an IDT Open Emitter LVHSTL Driver**

**Figure 3D. CLK/nCLK Input Driven by a 3.3V LVDS Driver**

**Figure 3E. CLK/nCLK Input Driven by a 3.3V HCSL Driver**

## 2.5V Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. *Figures 4A to 4E* show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only. Please consult

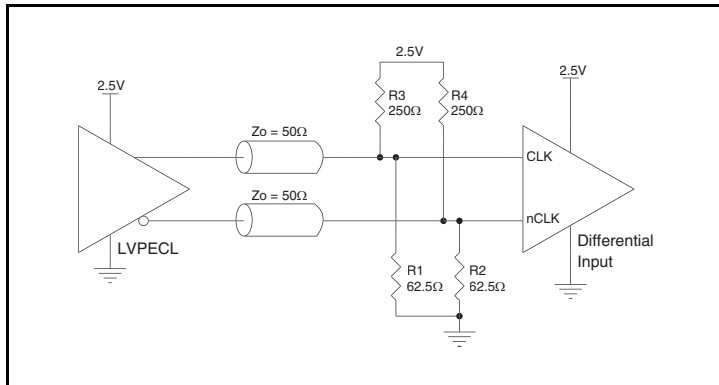

with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 4A, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

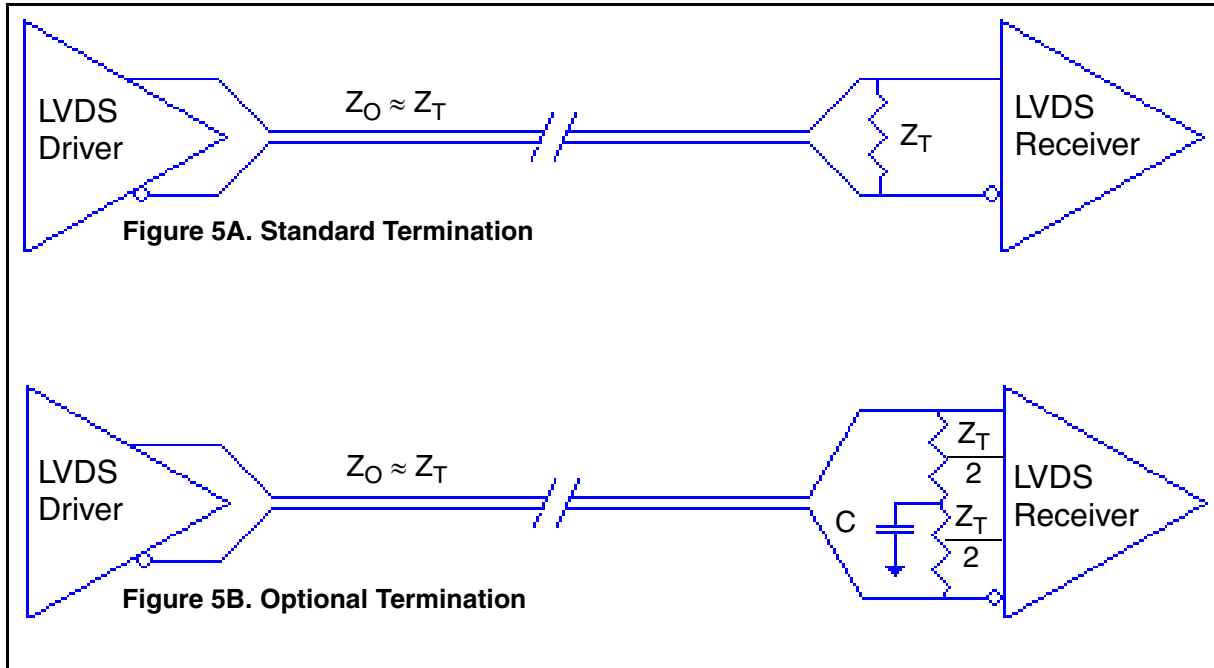

**Figure 4E. CLK/nCLK Input Driven by a 2.5V LVDS Driver**

## LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance ( $Z_T$ ) is between  $90\Omega$  and  $132\Omega$ . The actual value should be selected to match the differential impedance ( $Z_0$ ) of your transmission line. A typical point-to-point LVDS design uses a  $100\Omega$  parallel resistor at the receiver and a  $100\Omega$  differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source. The standard termination schematic as

shown in *Figure 5A* can be used with either type of output structure. *Figure 5B*, which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately  $50\text{pF}$ . If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

### LVDS Termination

### Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for

functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 6A and 6B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 6A. 3.3V LVPECL Output Termination

Figure 6B. 3.3V LVPECL Output Termination

### Termination for 2.5V LVPECL Outputs

Figure 7A and Figure 7B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to  $V_{CC0} - 2V$ . For  $V_{CC0} = 2.5V$ , the  $V_{CC0} - 2V$  is very close to ground

level. The R3 in Figure 7B can be eliminated and the termination is shown in Figure 7C.

## VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 8*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific and de-

pendent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/ Electrically Enhance Lead frame Base Package, Amkor Technology.

**Figure 8. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)**

## Schematic Layout

Figure 9 (next page) shows an example IDT8T49N524I application schematic that focuses on functional connections and is not configuration specific. Refer to the pin description and functional tables in the datasheet to ensure the logic control inputs are properly set. In this example, the input reference is LVDS and the outputs have all been configured for LVPECL.

In this example a 12pF parallel resonant Fox FX325BS 25MHz crystal is used with load caps  $C1 = C2 = 10\text{pF}$ . The load caps are recommended for frequency accuracy, but these may be adjusted for different board layouts. Crystals with different load capacities may be used, but the load capacitors will have to be changed accordingly. If different crystal types are used, please consult IDT for recommendations.

As with any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The IDT8T49N524I provides separate power supplies to isolate any high switching noise from coupling into the internal PLL.

In order to achieve the best possible filtering, it is recommended that the placement of the filter components be on the device side of the PCB as close to the power pins as possible. If space is limited, the  $0.1\mu\text{F}$  capacitor in each power pin filter and the resistor of the  $V_{\text{DDA}}$  power filters should be placed on the device side of the PCB and the other components can be placed on the opposite side.

Power supply filter recommendations are a general guideline to be used for reducing external noise from coupling into the devices. The filter performance is designed for wide range of noise frequency. This low-pass filter starts to attenuate noise at approximately 10kHz. If a specific frequency noise component with high amplitude interference is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally general design practice for power plane voltage stability suggests adding bulk capacitances in the general area of all devices.

Figure 9. IDT8T49N524I Application Schematic

## LVPECL Power Considerations

This section provides information on power dissipation and junction temperature for the IDT8T49N524I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the IDT8T49N524I is the sum of the core power plus the power dissipated due to loading. The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated due to loading.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 300mA = \mathbf{1039.5mW}$
- Power (outputs)<sub>MAX</sub> = **31.6mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $8 * 31.6mW = \mathbf{252.8mW}$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $1039.5mW + 252.8mW = \mathbf{1292.3mW}$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 27.9°C/W per Table 10 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 1.292\text{W} * 27.9^\circ\text{C/W} = 121.1^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 10. Thermal Resistance  $\theta_{JA}$  for 40 Lead VFQFN, Forced Convection**

Meters per Second	$\theta_{JA}$ by Velocity		
	0	1	2
Multi-Layer PCB; NOTE 1	27.9°C/W	21.6°C/W	19.1°C/W
Multi-Layer PCB, JEDEC Standard	NOTE 2	25.7°C/W	23.4°C/W

NOTE 1:  $\theta_{JA}$  simulation is performed with 4-layers, 8in. x 8in. PCB.

NOTE 2: JEDEC Standard requires air flow.

### 3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation for the LVPECL output pairs.

LVPECL output driver circuit and termination are shown in *Figure 10*.

**Figure 10. LVPECL Driver Circuit and Termination**

To calculate power dissipation per output pair due to loading, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CCO} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CCO\_MAX} - 0.75V$   
( $V_{CCO\_MAX} - V_{OH\_MAX}$ ) = **0.75V**
- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CCO\_MAX} - 1.6V$   
( $V_{CCO\_MAX} - V_{OL\_MAX}$ ) = **1.6V**

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - 0.75V)/50\Omega] * 0.75V = \mathbf{18.75mW}$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - 1.6V)/50\Omega] * 1.6V = \mathbf{12.8mW}$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = \mathbf{31.6mW}$

## LVDS Power Considerations

This section provides information on power dissipation and junction temperature for the IDT8T49N524I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the IDT8T49N524I is the sum of the core power plus the analog power plus the power dissipated due to the load. The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * (I_{CC\_MAX} + I_{CCA\_MAX}) = 3.465V * (212mA + 18mA) = 796.95mW$
- Power (outputs)<sub>MAX</sub> =  $V_{CCO\_MAX} * I_{CCO\_MAX} = 3.465V * 167mA = 578.66mW$

**Total Power<sub>MAX</sub> = 796.95mW + 578.66mW = 1375.61mW**

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 27.9°C/W per Table 11 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 1.376\text{W} * 27.9^\circ\text{C}/\text{W} = 123.40^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 11. Thermal Resistance  $\theta_{JA}$  for 40 Lead VFQFN, Forced Convection**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2
Multi-Layer PCB; NOTE 1	27.9°C/W	21.6°C/W	19.1°C/W
Multi-Layer PCB, JEDEC Standard	NOTE 2	25.7°C/W	23.4°C/W

NOTE 1:  $\theta_{JA}$  simulation is performed with 4-layers, 8in. x 8in. PCB.

NOTE 2: JEDEC Standard requires air flow.

## Reliability Information

**Table 12.  $\theta_{JA}$  vs. Air Flow Table for a 40 Lead VFQFN**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2
Multi-Layer PCB; NOTE 1	27.9°C/W	21.6°C/W	19.1°C/W
Multi-Layer PCB, JEDEC Standard	NOTE 2	25.7°C/W	23.4°C/W

NOTE 1:  $\theta_{JA}$  simulation is performed with 4-layers, 8in. x 8in. PCB.

NOTE 2: JEDEC Standard requires air flow.

## Transistor Count

The transistor count for IDT8T49N524I is: 35,322
