LED Driver IC

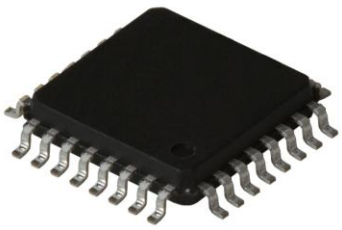
IK6208

Description

The IK6028 are anode-grid LED display drives 5.0V~18.0V with output size – 8 digits x 9 segments and addition key scan function.
Serial interface(UART) provides connection with microprocessor.
PWM for Buzzer driving.

Features

- Operation voltage for digital part: 3.0V ~ 3.6V
- Operation voltage for output LEDs: 5.0V ~ 18.0V
- 7-step individual dimming control for each grid
- OSC: built in (with external resistor) 500kHz @ R=12.1kΩ
- Pulse segment current: 27mA-39mA @ 8 digits x 9 segments
- Key scanning: 7x2 matrix
- Serial Interface(UART). Up to 57,600bps
- 2 Channel PWM
- Operation Temperature : -40 ~ 85°C



LQFP-32

Application

- Home Appliance : Washing machine, Refregerator, Bidet, Air Conditioner

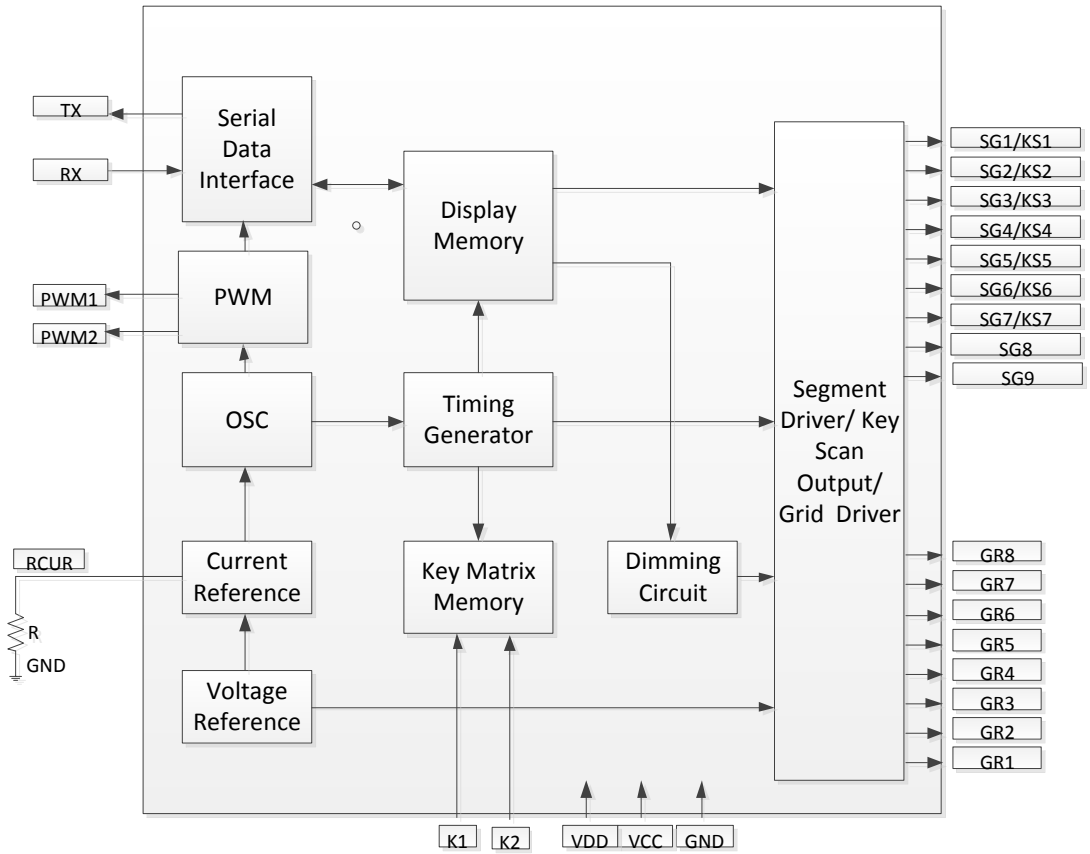
Pin Description IK6208

Pin Name	I/O	Description	Pin №
RCUR	I/O	A resistor is connected to this pin to determine the output currents and oscillation frequency.	4
TX	O	Data Output Pin This pin output serial data by UART	6
RX	I	Data Input Pin This pin receive serial data by UART.	5
PWM1/2	O	8/16 bit PWM out put.	8/9
K1/K2	I	Key Data Input Pins The data sent to these pins are latched at the end of the display cycle. (Internal Pull-Up Resistor)	14/15
VDD1/2	-	Power Supply for Digital Part	11/16
VCC	-	Power Supply for Output Part	27
SG1/KS1 to SG9	O	Segment Output Pins (N-channel open drain) Also acts as the Key Source	18-26
GR1 to GR8	O	Grid Output Pins (P-Channel, Open Drain)	1-3,28-32
GND1/2	-	Ground.	10/17
T1	-	Reserved.	7

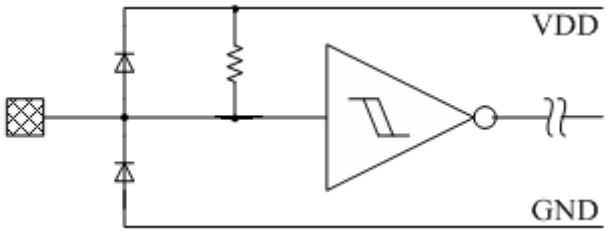
BLOCK DIAGRAM



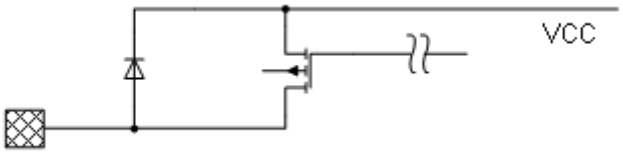
INPUT / OUTPUT CONFIGURATIONS

The schematic diagrams of the input and output circuits of the logic section are shown below.

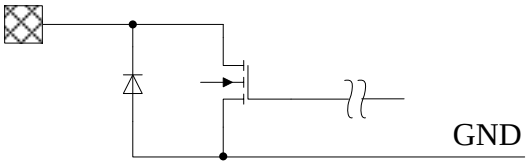
Input Pins: K1/K2



Output Pins: GR1 to GR8

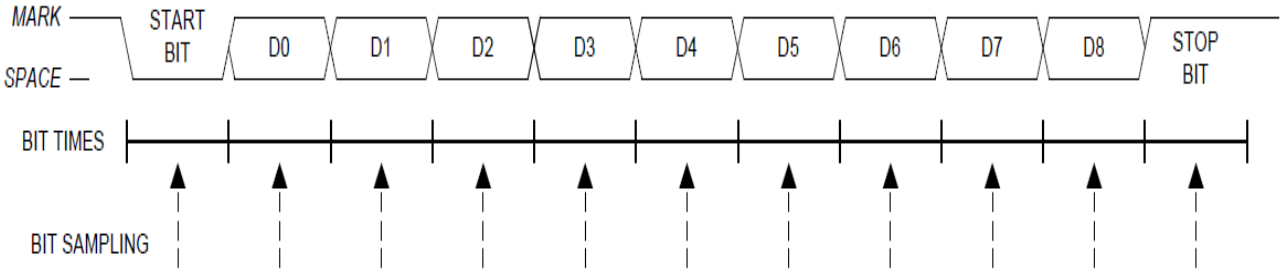


Output Pins: SG1/KS1 to SG9



UART

UART uses a total of eleven bits per data byte: a start bit, 8 data bits (LSB first), a parity bit, and a stop bit.



FUNCTIONAL DESCRIPTION

COMMANDS

A command is the first byte (b0 to b7) inputted to IK6208 via DI/O Pin after STB Pin has changed from ”HIGH” to “LOW” state. If for some reason the STB Pin is set “HIGH” while data or commands are being transmitted, the serial communication is initialized, and the data commands being transmitted are considered invalid.

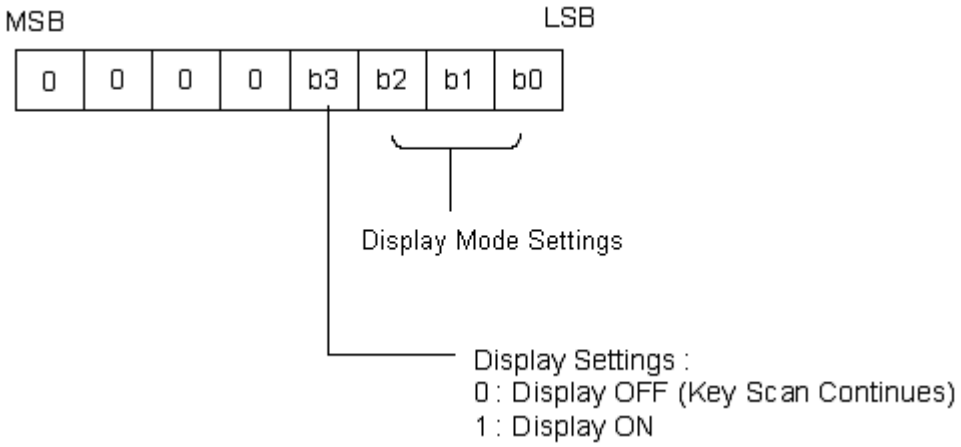
COMMAND 1: DISPLAY MODE SETTING COMMANDS

IK6208 provides 5 display modes setting as shown in the diagram below. As stated earlier a command is the first one byte (b0 to b7) transmitted to IK6208 via the DI/O Pin when STB is “LOW”. However, for these commands, Bit 5 to Bit 8 (b4 to b7) are given a value of “0”.

The Display Mode Setting Commands determine the number of segments and grids are used (9 segments, 8 grids). A display commands “ON” must be executed in order to resume display. If the same mode setting is selected, no command execution is take place, therefore, nothing happens.

The Display Mode Setting Commands are also used to turn ON or OFF the display. Please refer to the diagram below.

When the power is turned ON, the display is turned OFF (b3 is “0”) and the mode 111 is selected (b2 to b0 are “1”).

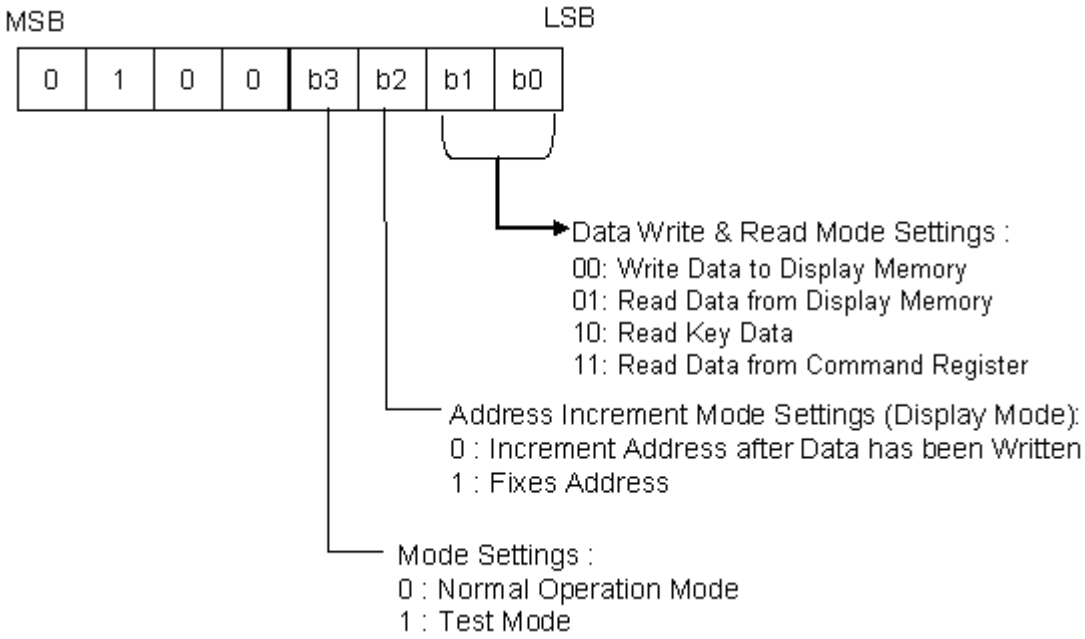


Display Mode Settings 111: 8 Grids (9 Segments)

COMMAND 2: DATA SETTING COMMANDS

The Data Setting Commands executes the Data Write Mode for IK6208. The Data Setting Command, the bits5 and 6 (b4, b5) are given the value of “0”. , bit7 (b6) is given the value of “1” while bit8 (b7) is given the value of “0”. Please refer to the diagram below.

When power is turned ON, bit 4 to bit 1 (b3 to b0) are given the value of “0”.



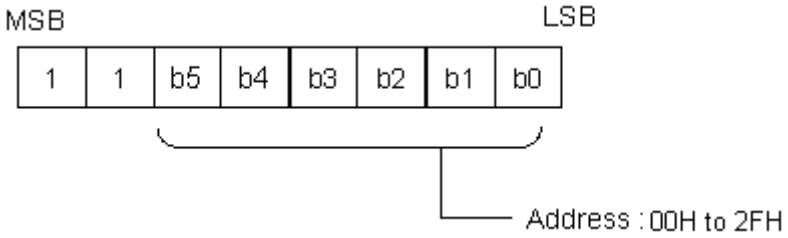
Read Data from Command Register:

	1st byte								2nd byte							
DOUT	b0	b1	b2	b3	b4	b5	b6	b7	b0	b1	b2	b3	b4	b5	b6	b7
	b0-b3 of command1				b0-b3 of command2				b0-b5 of command3						don’t care	

COMMAND 3: ADDRESS SETTING COMMANDS

Address Setting Commands are used to set the address of the display memory. The address is considered valid if it has a value of “00H” to 2FH”. If the address is set to 30H or higher, the data is ignored until a valid address is set. When power is turned ON, the address is set at “00H”.

Please refer to the diagram below.



DISPLAY MODE AND RAM ADDRESS

Data transmitted from an external device to IK6208 via the serial interface are stored in the Display RAM and are assigned addresses. When the power is turned ON, the memory is set at “0”. The RAM Addresses of IK6208 are given below in 8 bit unit.

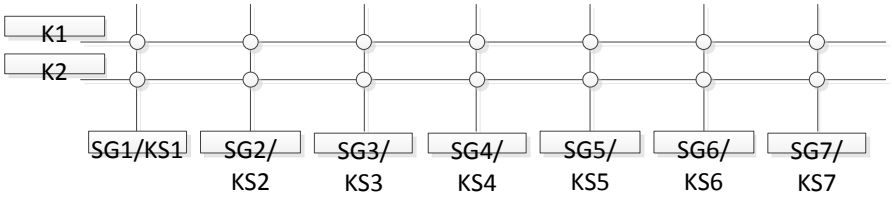
KEY MATRIX & KEY INPUT DATA STORAGE RAM

Key Matrix consists of 7 x 2 array as shown below:



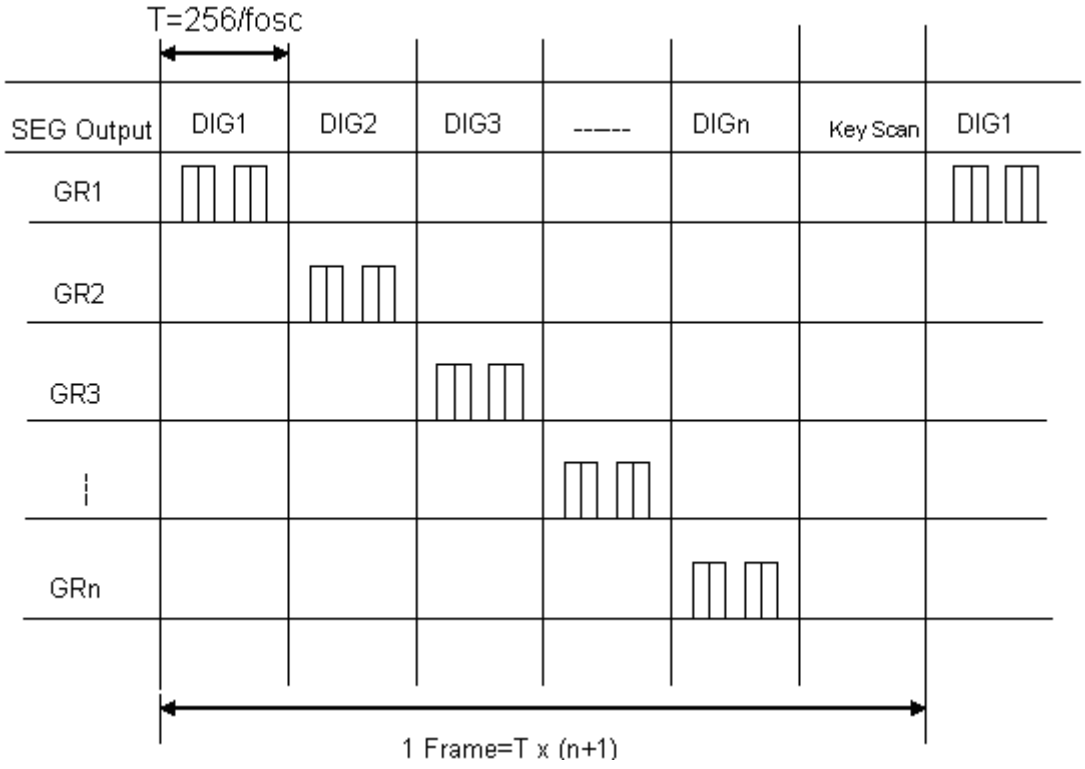
Each data entered by each key (or any combination of keys) is stored as follows and read by a READ Command, starting from the last significant bit. When the most significant bit of the data (b0) has been read, the least significant bit of the next data (b7) is read.

K1 K2	K1 K2		
SG1/KS1	SG2/KS2	x	1’st byte read
SG3/KS3	SG4/KS4	x	2’nd byte read
SG5/KS5	SG6/KS6	x	3’rd byte read
SG7/KS7		x	4’th byte read

b0 b1 b2 b3 b4 b5 b6 b7

Key press=”1”, Key no press=”0” read.

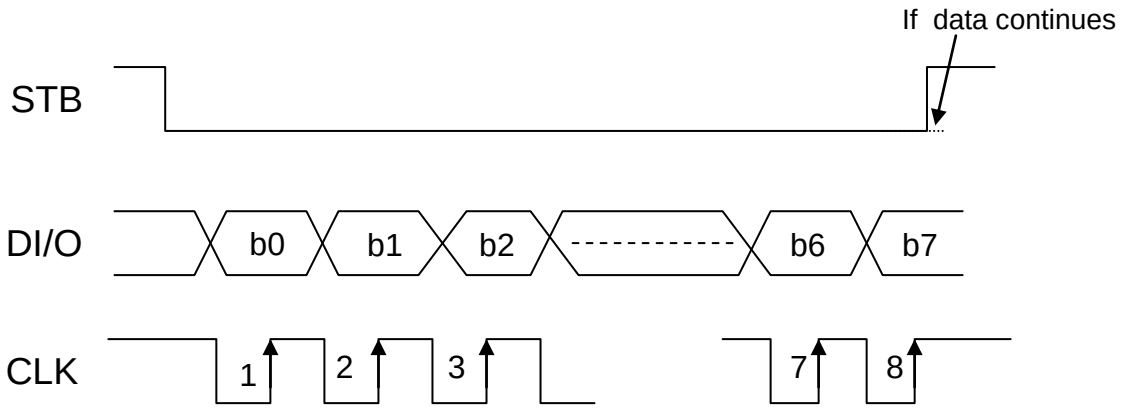
SCANNING AND DISPLAY TIMING



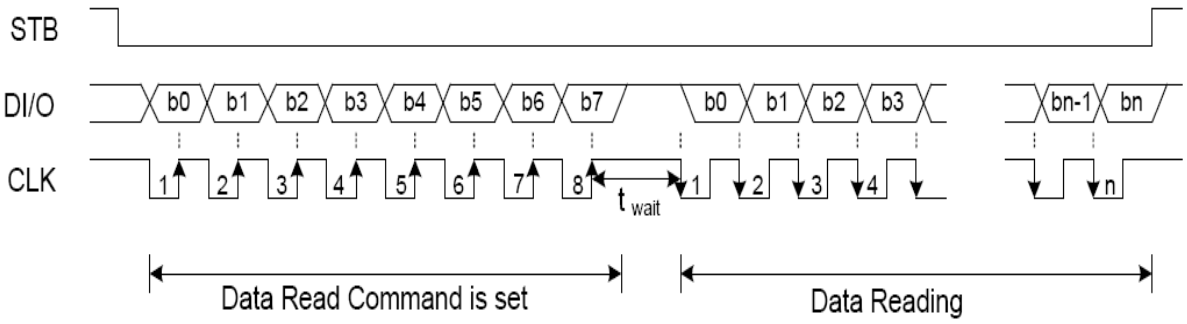
SERIAL COMMUNICATION FORMAT

The following diagram shows the serial communication format.

Reception (Data/Command Write)



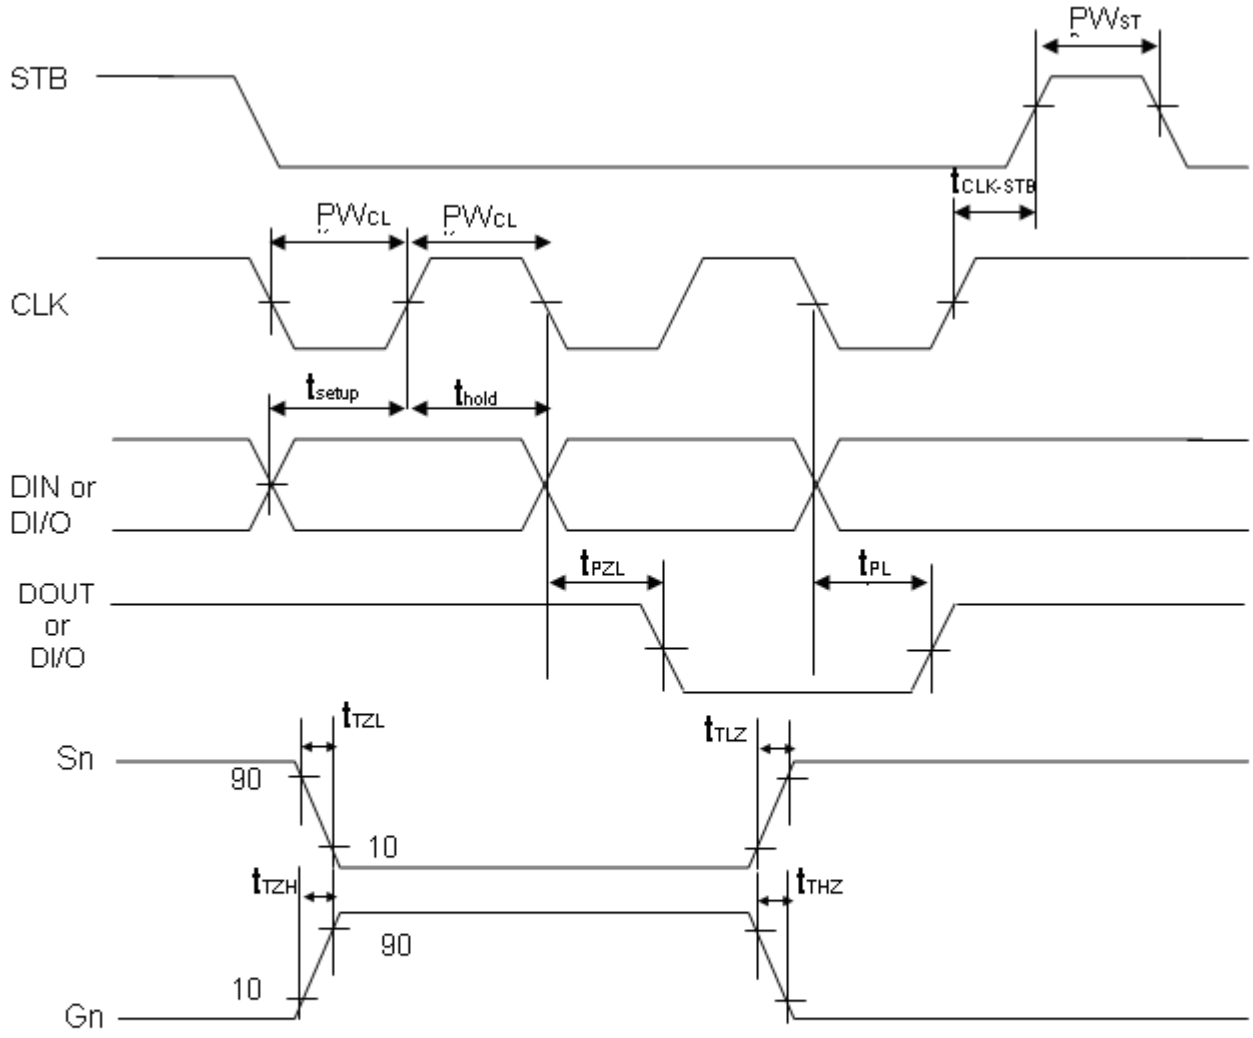
Transmission (Data Read)



Where: t_{wait} (waiting time) ≥ 1μs

SWITCHING CHARACTERISTIC WAVEFORM

Switching Characteristics Waveform is given below.

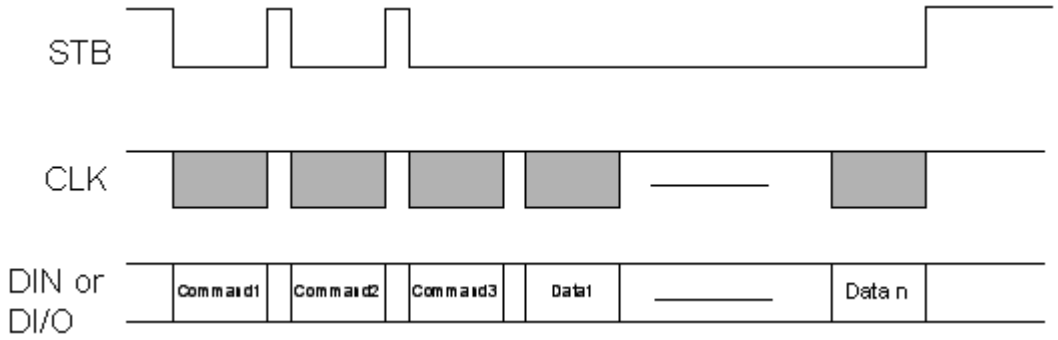


PW $_{CLK}$ (Clock Pulse Width) ≥400ns
t setup (Data Setup Time) ≥ 100ns
t $_{CLK-STB}$ (Clock - Strobe Time) ≥ 1μs
t $_{TZH}$ (Rise Time) ≤ 1μs
t $_{TZL}$ <1μs

PW$_{STB}$ (Strobe Pulse Width) ≥ 1μs
thold (Data Hold Time) ≥ 100ns
t $_{THZ}$ (Fall Time) ≤ 10μs
fosc = Oscillation Frequency
t $_{TIZ}$ <10μs

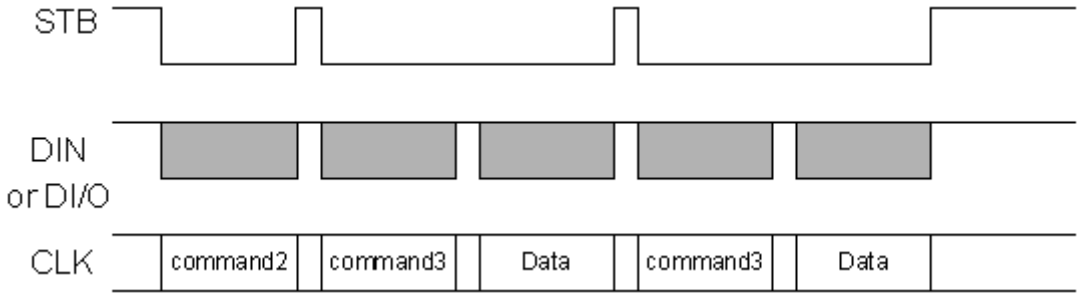
APPLICATIONS

Display memory is updated by incrementing addresses. Please refer to the following diagram.



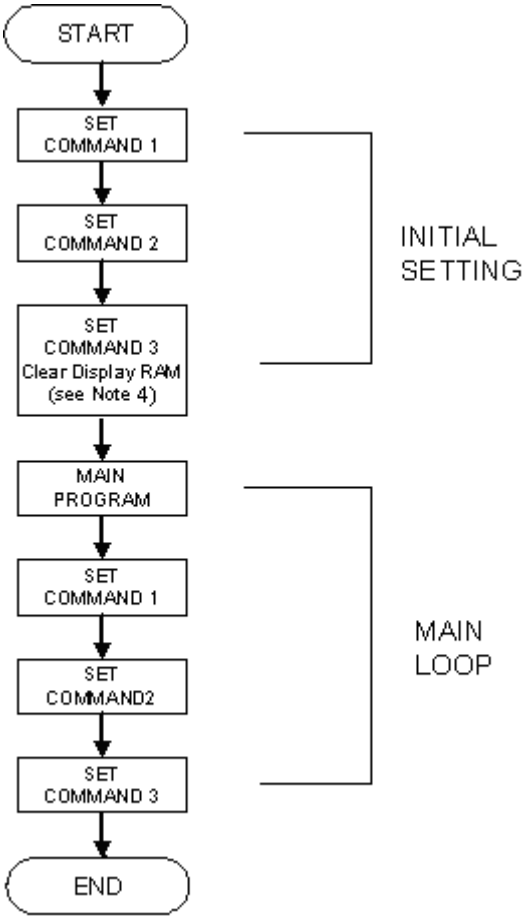
Where: Command 1: Display Mode Setting
Command 2: Data Setting Command
Command 3: Address Setting Command
Data 1 to n : Transfer Display Data (48 Bytes max.)

The following diagram shows the waveforms when updating specific addresses.



Where: Command 2 -- Data Setting Command
Command 3 -- Address Setting Command
Data -- Display Data

RECOMMENDED SOFTWARE PROGRAMMING FLOWCHART



Note: 1. Command 1: Display Mode Setting
2. Command 2: Data Setting Commands
3. Command 3: Address Setting Commands
4. When IC power is applied for the first time, the contents of the Display RAM are not defined: thus, it is strongly suggested that the contents of the Display RAM must be cleared during the initial setting.

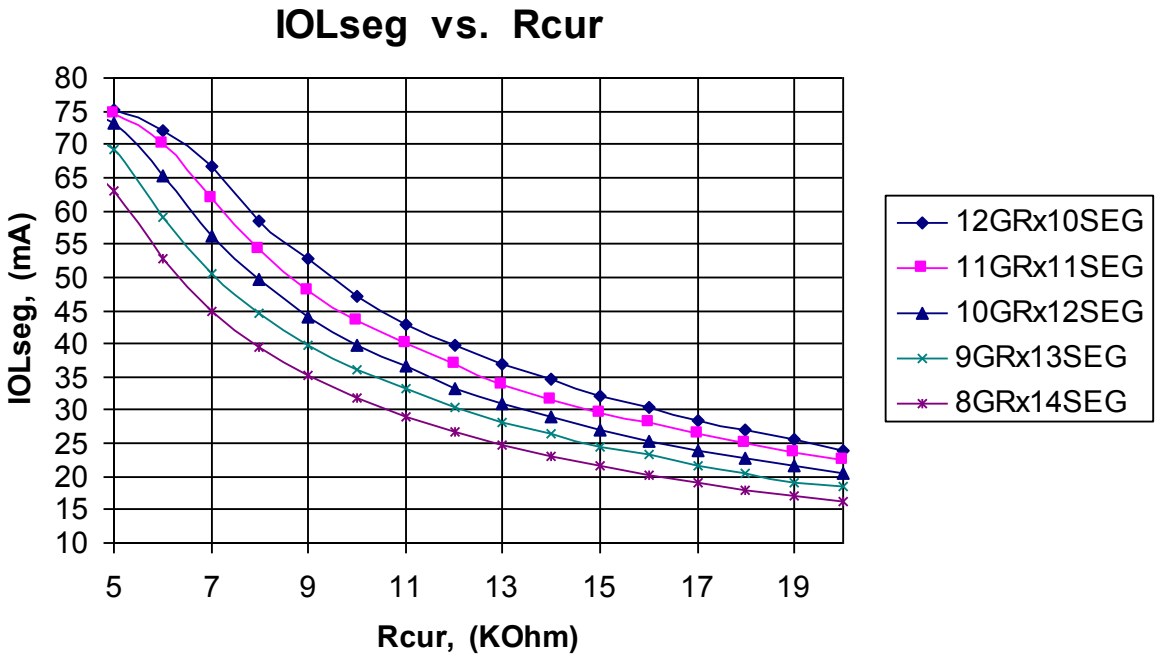
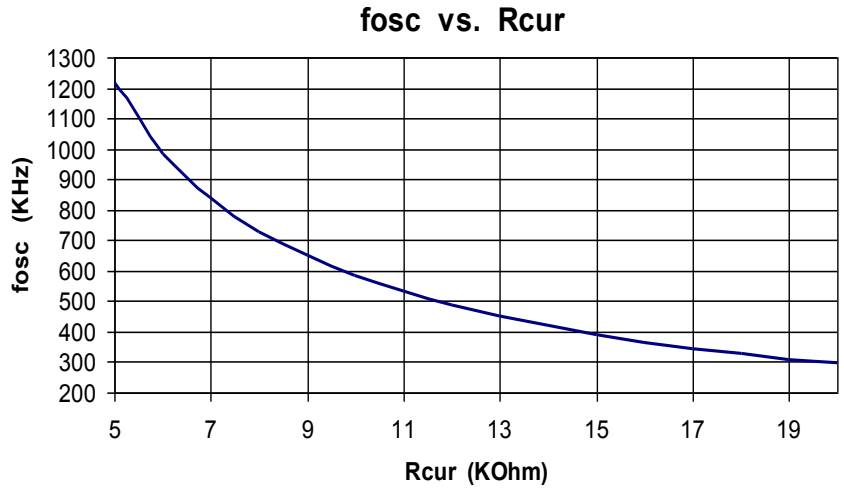
APPLICATION NOTE





1. The graph of I_{OLSG} vs. R_{CUR} is given for the case when only one segment is turn on. Choosing the external resistor R_{CUR} for the setting I_{OLSG}, make sure, that current

$$I_{OHGR}=(\text{number of segments})*I_{OLSG} \leq 390mA$$

2. The cell of Display Memory has a dead time zone. If the software program is not correct, it is possible the blinking of display. The blinking frequency for the single segment is:

$$F_{BLINK}^{MAX} = \frac{F_{COMMAND2}}{256*G}(1+0.5*\frac{F_{OSC}}{F_{CLK}})$$, (less value is better),

where $F_{COMMAND2}$ – frequency of the use of the command2 (Write Data to Display Memory);

G– number of grids in used mode;

F_{OSC} – frequency of internal OSC;

F_{CLK} – clock frequency.

So, main rule for update the Display Memory is do it if it really need. Don't do it continually with high speed, but if it something like movie you can. Or another way is turn off the display while the command of Write Data to Display Memory is executed.
