7.1.5.2. Parallel Interface Pause	39
7.1.6. Data Transfer Mode.....	40
7.1.6.1. Method 1	40
7.1.6.2. Method 2.....	40
7.2. RGB Interface	41
7.2.1. RGB Interface Selection	41
7.2.2. RGB Interface Timing	43
7.3. MIPI – DSI (Mobile Industry Processor Interface – Display Serial Interface)	44
7.3.1. Interface Level Communication – Clock Lanes	45
7.3.1.1. Low Power Mode (LPM)	46
7.3.1.2. Ultra Low Power Mode (ULPM).....	48
7.3.1.3. High-Speed Clocked Mode (HSCM).....	49
7.3.2. Interface Level Communication – Data Lanes	51
7.3.2.1. Escape Modes	52
7.3.2.1.1. Low-Power Data Transmission (LPDT)	54
7.3.2.1.2. Ultra-Low Power State (ULPS)	55
7.3.2.1.3. Remote Application Reset (RAR)	56
7.3.2.1.4. Tearing Effect (TEE).....	57
7.3.2.1.5. Acknowledge (ACK).....	58

7.3.2.2. High-Speed Data Transmission (HSDT).....	59
7.3.2.2.1. Entering High-Speed Data Transmission (TSOT of HSDT).....	59
7.3.2.2.2. Leaving High-Speed Data Transmission (T _{EOT} of HSDT)	60
7.3.2.2.3. Burst of the High-Speed Data Transmission (HSDT)	61
7.3.2.3. Bus Turnaround (BTA).....	62
7.3.3. Packet Level Communication.....	63
7.3.3.1. Short Packet and Long Packet Structures.....	63
7.3.3.1.1. Bit Order of the Byte on Packets	64
7.3.3.1.2. Byte Order of the Multiple Byte Information on Packets.....	64
7.3.3.1.3. Packet Header (PH).....	65
7.3.3.1.3.1. Data Identification (DI)	66
7.3.3.1.3.1.1. Virtual Channel (VC).....	67
7.3.3.1.3.1.2. Data Type (DT)	68
7.3.3.1.3.2. Packet Data on the Short Packet.....	70
7.3.3.1.3.3. Word Count on the Long Packet.....	71
7.3.3.1.3.4. Error Correction Code (ECC).....	72
7.3.3.1.4. Packet Data on the Long Packet	76
7.3.3.1.5. Packet Footer on the Long Packet	77
7.3.3.2. Packet Transmissions.....	79
7.3.3.2.1. Packet form the MCU to ILI9486	79
7.3.3.2.1.1. Display Command Set (DCS).....	79
7.3.3.2.1.2. Display Command Set Write, no Parameter (DCSWN-S).....	80
7.3.3.2.1.3. Display Command Set Write, 1 Parameter (DCSW1-S).....	81
7.3.3.2.1.4. Display Command Set Write Long (DCSW-L).....	82
7.3.3.2.1.5. Display Command Set Read, No Parameter (DCSRN-S).....	87
7.3.3.2.1.6. Null Packet, No Data (NP-L).....	90
7.3.3.2.1.7. End of Transmission Packet (EoTP).....	92
7.3.3.2.2. Packet from ILI9486 to MCU	94
7.3.3.2.2.1. Used Packet Types	94
7.3.3.2.2.2. Acknowledge with Error Report	95
7.3.3.2.2.3. DCS Read Long Response (DCSRR-L).....	98
7.3.3.2.2.4. DCS Read Short Response, 1 Byte Returned (DCSRR1-S).....	100
7.3.3.2.2.5. DCS Read Short Response, 2 Bytes Returned (DCSRR2-S).....	101
7.3.3.3. Communication Sequences.....	102
7.3.3.3.1. DCS Write, 1 Parameter Sequence (DCSRR2-S).....	103
7.3.3.3.2. DCS Write, No Parameter Sequence	104
7.3.3.3.3. DCS Write, No Parameter Sequence	105
7.3.3.3.4. DCS Read, No Parameter Sequence.....	107
7.3.3.3.5. Null Packet, No Data Sequence	109

7.3.3.3.6.	End of Transmission Packet	109
7.4.	CABC (Content Adaptive Brightness Control).....	110
7.5.	MDDI (Mobile Display Digital Interface)	112
7.6.	Display Data RAM (DDRAM)	122
7.7.	Display Data Format	123
7.7.1.	3-line Serial Interface.....	123
7.7.2.	4-line Serial Interface.....	125
7.7.3.	8-bit Parallel MCU Interface	127
7.7.3.1.	8-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color	128
7.7.3.2.	8-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	129
7.7.4.	9-bit Parallel MCU Interface	130
7.7.5.	16-bit Parallel MCU Interface	131
7.7.5.1.	16-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color	132
7.7.5.2.	16-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	133
7.7.6.	18-bit Parallel MCU Interface	134
7.7.6.1.	18-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	135
7.7.7.	16-bit Parallel RGB Interface.....	136
7.7.8.	18-bit Parallel RGB Interface.....	136
7.7.9.	MIPI - DSI	137
7.7.10.	MIPI – 18-bit per Pixel, Long packet, Data Type = 01 1110 (1Eh).....	138
7.7.11.	MIPI – 18-bit per Pixel, Long packet, Data Type = 10 1110 (2Eh).....	139
7.8.	Z-inversion.....	140
7.8.1	Z-inversion concept.....	141
7.8.2	Z-inversion Odd/Even Gate data input method.....	142
7.8.3	Z-inversion data input method.....	143
7.8.3.1	Z-inversion RED Data display	144
7.8.3.2	Z-inversion GREEN Data display	145
7.8.3.3	Z-inversion BLUE Data display	146
8.	Command.....	147
8.1.	Command List	147
8.2.	Command Description.....	152
8.2.1.	NOP (00h).....	152
8.2.2.	Soft Reset (01h)	153
8.2.3.	Read display identification information (04h)	154
8.2.4.	Read Number of the Errors on DSI (05h).....	155
8.2.5.	Read Display Status (09h).....	156
8.2.6.	Read Display Power Mode (0Ah)	158
8.2.7.	Read Display MADCTL (0Bh).....	160
8.2.8.	Read Display Pixel Format (0Ch).....	162

8.2.9. Read Display Image Mode (0Dh)	163
8.2.10. Read Display Signal Mode (0Eh)	165
8.2.11. Read Display Self-Diagnostic Result (0Fh)	167
8.2.12. Sleep IN (10h)	169
8.2.13. Sleep OUT (11h).....	170
8.2.14. Partial Mode ON (12h).....	171
8.2.15. Normal Display Mode ON (13h)	172
8.2.16. Display Inversion OFF (20h).....	173
8.2.17. Display Inversion ON (21h)	174
8.2.18. Display OFF (28h)	175
8.2.19. Display ON (29h)	176
8.2.20. Column Address Set (2Ah)	177
8.2.21. Page Address Set (2Bh)	179
8.2.22. Memory Write (2Ch)	181
8.2.23. Memory Read (2Eh)	183
8.2.24. Partial Area (30h).....	185
8.2.25. Vertical Scrolling Definition (33h)	187
8.2.26. Tearing Effect Line OFF (34h)	190
8.2.27. Tearing Effect Line ON (35h).....	191
8.2.28. Memory Access Control (36h)	193
8.2.29. Vertical Scrolling Start Address (37h)	195
8.2.30. Idle Mode OFF (38h)	197
8.2.31. Idle Mode ON (39h)	198
8.2.32. Interface Pixel Format (3Ah).....	200
8.2.33. Memory Write Continue (3Ch).....	201
8.2.34. Memory Read Continue (3Eh).....	203
8.2.35. Write Tear Scan Line (44h).....	205
8.2.36. Read Scan Line (45h).....	206
8.2.37. Write Display Brightness Value (51h)	207
8.2.38. Read Display Brightness Value (52h).....	208
8.2.39. Write CTRL Display Value (53h).....	209
8.2.40. Read CTRL Display Value (54h)	211
8.2.41. Write Content Adaptive Brightness Control Value (55h).....	212
8.2.42. Read Content Adaptive Brightness Control Value (56h)	213
8.2.43. Write CABC Minimum Brightness (5Eh).....	214
8.2.44. Read CABC Minimum Brightness (5Fh).....	215
8.2.45. Read First Checksum (AAh).....	216
8.2.46. Read Continue Checksum (AFh)	217
8.2.47. Read ID1 (DAh).....	218

8.2.48. Read ID2 (DBh)	219
8.2.49. Read ID3 (DCh)	220
8.2.50. Interface Mode Control (B0h)	221
8.2.51. Frame Rate Control (In Normal Mode/Full Colors) (B1h).....	223
8.2.52. Frame Rate Control (In Idle Mode/8 colors) (B2h)	225
8.2.53. Frame Rate control (In Partial Mode/Full Colors) (B3h).....	226
8.2.54. Display Inversion Control (B4h).....	227
8.2.55. Blanking Porch Control (B5h)	228
8.2.56. Display Function Control (B6h).....	230
8.2.57. Entry Mode Set (B7h)	234
8.2.58. Power Control 1 (C0h).....	237
8.2.59. Power Control 2 (C1h).....	239
8.2.60. Power Control 3 (For Normal Mode) (C2h)	241
8.2.61. Power Control 4 (For Idle Mode) (C3h)	242
8.2.62. Power Control 5 (For Partial Mode) (C4h).....	243
8.2.63. VCOM Control (C5h)	244
8.2.64. CABC Control 9(C6h)	247
8.2.65. CABC Control 1 (C8h)	248
8.2.66. CABC Control 2 (C9h)	249
8.2.67. CABC Control 3 (CAh).....	251
8.2.68. CABC Control 4 (CBh).....	252
8.2.69. CABC Control 5 (CCh)	254
8.2.70. CABC Control 6 (CDh)	255
8.2.71. CABC Control 7 (CEh).....	256
8.2.72. CABC Control 8 (CFh).....	257
8.2.73. NV Memory Write (D0h)	258
8.2.74. NV Memory Protection Key (D1h)	259
8.2.75. NV Memory Status Read (D2h)	260
8.2.76. Read ID4 (D3h)	261
8.2.77. PGAMCTRL(Positive Gamma Control) (E0h)	262
8.2.78. NGAMCTRL (Negative Gamma Correction) (E1h)	263
8.2.79. Digital Gamma Control 1 (E2h)	264
8.2.80. Digital Gamma Control 2 (E3h)	264
8.2.81. SPI Read Command Setting(FBh)	265
9. Display Data RAM	266
9.1. Configuration	266
9.2. Memory to Display Address Mapping	267
9.3. MCU to memory write/read direction	268
10. Tearing Effect Information	271

10.1. Tearing Effect Line	272
10.1.1. Tearing Effect Line Modes	272
10.1.2. Tearing Effect Line Timing	273
10.2. Tearing Effect Bus Trigger	274
10.2.1. Tearing Effect Bus Trigger Enable	274
10.2.2. Tearing Effect Bus Trigger Disable	275
10.2.3. Tearing Effect Bus Trigger Sequences	276
11. Sleep Out – Command and Self-Diagnostic Functions of ILI9486	279
11.1. Register loading Detection	279
11.2. Functionality Detection	280
12. Power ON/OFF Sequence	281
12.1. Case 1 – RESX line is held High or Unstable by Host at Power ON	281
12.2. Case 2 – RESX line is held Low by Host at Power ON	281
12.3. Uncontrolled Power Off	283
13. Power Level Definition	284
13.1. Power Levels	284
13.2. Power Flow Chart	285
13.3. LCM Voltage Generation	286
14. Reset	287
14.1. Registers	287
14.2. Output Pins, I/O Pins	288
14.3. Input Pins	288
14.4. Reset Timing	289
15. NV Memory Programming Flow	290
16. Gamma Correction	291
17. Electrical Characteristics	292
17.1. Absolute Maximum Ratings	292
17.2. DC Characteristics	293
17.2.1. DC characteristics for Power Lines	293
17.2.2. DC characteristics for DSI LP mode	294
17.2.3. Spike / Glitch Rejection	294
17.2.4. DC Characteristics for DSI HS mode	295
17.2.5. DC Characteristics for Panel Driving	297
17.3. AC Characteristics	298
17.3.1. Display Parallel 18/16/9/8-bit Interface Timing Characteristics (8080-series)	298
17.3.2. Display Serial Interface Timing Characteristics (3-line SPI system)	300
17.3.3. Display Serial Interface Timing Characteristics (4-line SPI system)	301
17.3.4. Parallel 18/16-bit RGB Interface Timing Characteristics	302
17.3.5. MDDI Receiver Timing Characteristics	303

17.3.6. DSI.....	304
17.3.6.1. High Speed Mode – Clock Channel Timing	304
17.3.6.2. High Speed Mode – Data Clock Channel Timing	304
17.3.6.3. High Speed Mode – Rise and Fall Timings.....	305
17.3.6.4. Low Speed Mode – Bus Turn Around	306
17.3.6.5. Data Lanes from Low Power Mode to High Speed Mode.....	307
17.3.6.6. Data Lanes from High Speed Mode to Low Power Mode.....	308
17.3.6.7. DSI Clock Burst – High Speed Mode to/from Low Power Mode	309
18. Application Circuit	310
19. Revision History	312

1. Introduction

ILI9486 is a 262,144-color single-chip SoC driver for a-Si TFT liquid crystal display with resolution of 320RGBx480 dots, comprising a 960-channel source driver, a 480-channel gate driver, 345,600bytes GRAM for graphic data of 320RGBx480 dots, and power supply circuit.

The ILI9486 supports parallel CPU 8-/9-/16-/18-bit data bus interface and 3-/4-line serial peripheral interfaces (SPI). The ILI9486 is also compliant with RGB (16-/18-bit) data bus for video image display. For high speed serial interface, the ILI9486 also provides one data and clock lane and supports up to 500Mbps on MIPI DSI link. And also support MDDI interface.

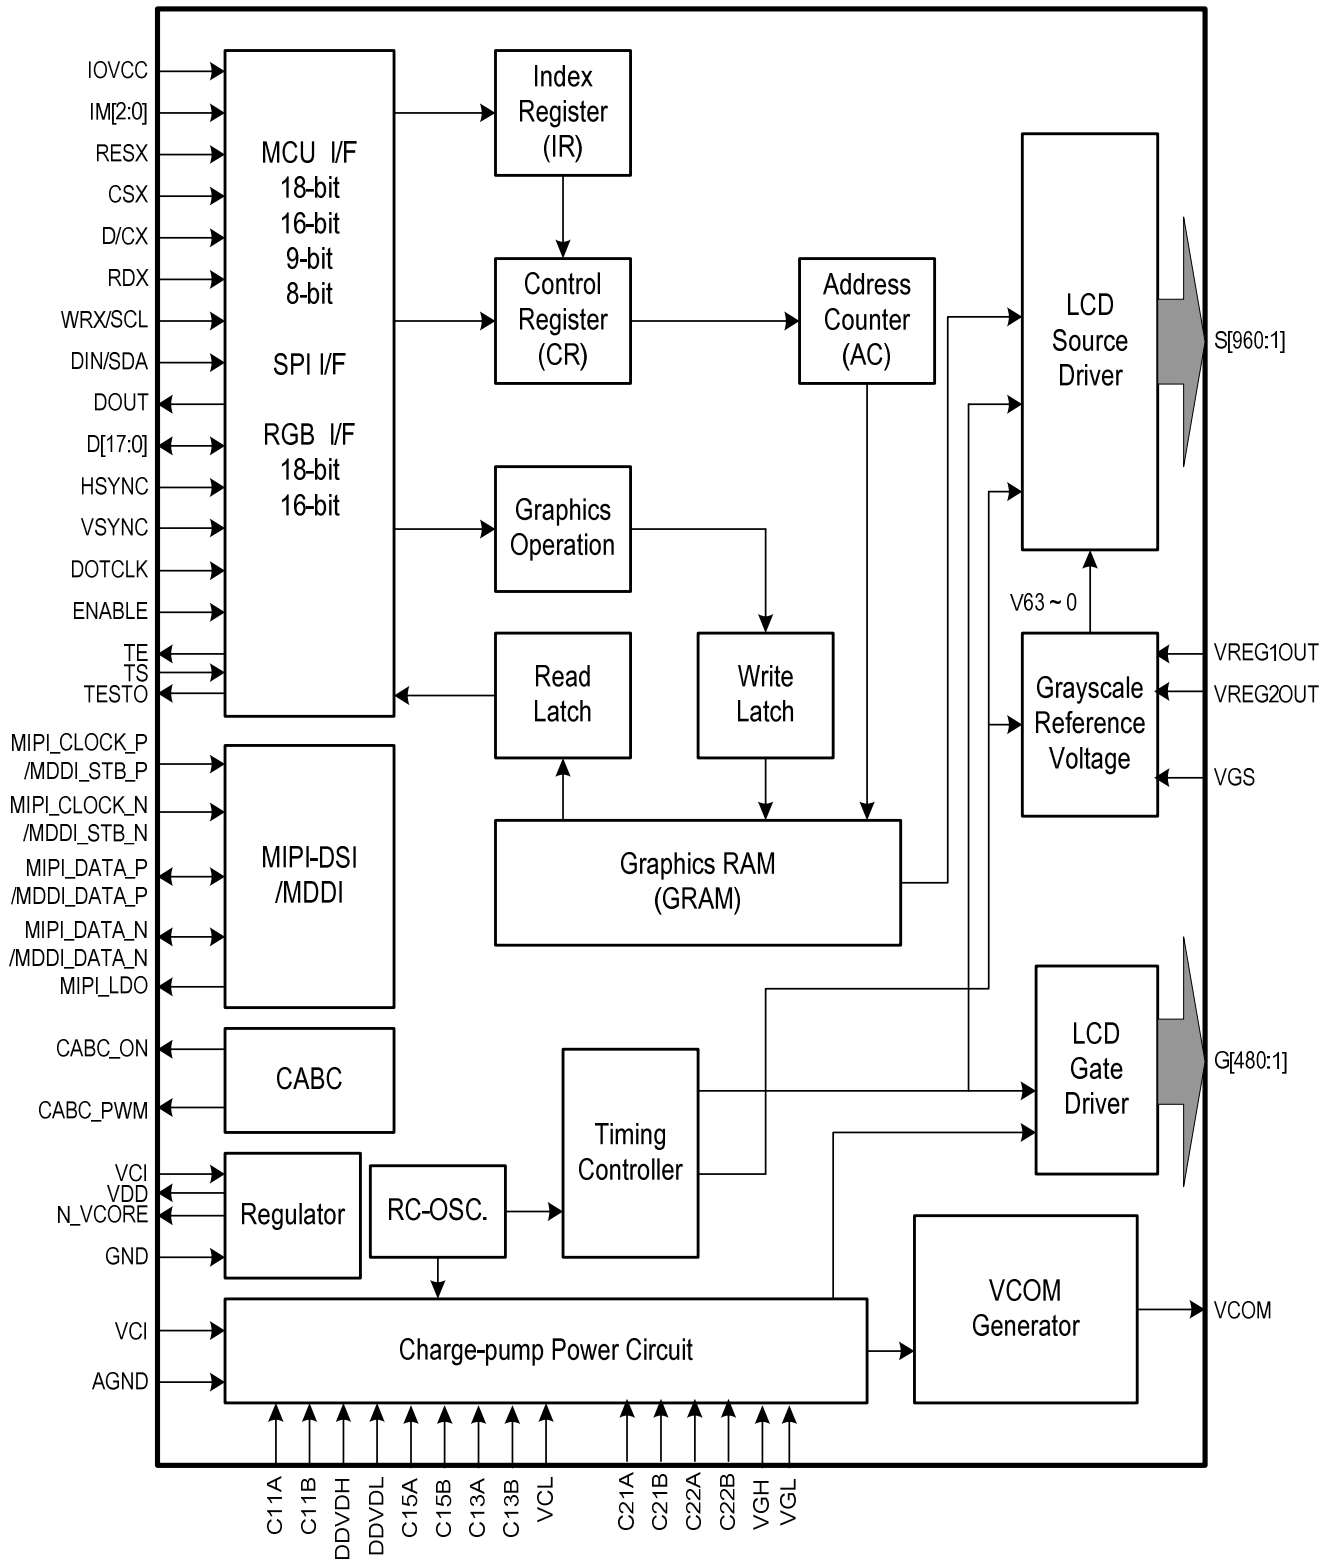

ILI9486 can operate with 1.65V I/O interface voltage and support wide analog power supply range. The ILI9486 also supports a function to display in 8 colors and a sleep mode, allowing for precise power control by software and these features make the ILI9486 as an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP where long battery life is a major concern.

2. Features

- ◆ Display resolution: [320xRGB](H) x 480(V)
- ◆ Output:
 - 960 source outputs
 - 480 gate outputs
 - Common electrode output
- ◆ a-TFT LCD driver with on-chip full display RAM: 345,600 bytes
- ◆ Interface
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 8080-series MCU
 - 16-bits, 18-bits RGB interface with graphic controller
 - 3-line / 4-line serial interface
 - MIPI DSI (DSI v1.01r11, D-PHY v1.0), one lane 500Mbps.
 - MDDI (Mobile Display Digital Interface), one lane 400Mbps, support VESA V1.0/V1.2.
- ◆ Display mode:
 - Full color mode (Idle mode OFF) : 262K-colors, 65K-colors.
 - Reduce color mode (Idle mode ON) : 8-color.
- ◆ Power saving mode:
 - Deep-standby mode
 - Sleep mode
- ◆ On chip functions:
 - DC VCOM generator and adjustment
 - Timing generator
 - Oscillator
 - DC/DC converter
 - Dot/Column/Z inversion
 - Separate RGB Gamma correction
 - CABBC(Content adaptive brightness control)
- ◆ MTP (4 times):
 - 8-bits for ID1
 - 8-bits for ID2
 - 8-bits for ID3
 - 7-bits for VCOM adjustment

- ◆ Low -power consumption architecture
 - Low operating power supplies:
 - IOVCC = 1.65V ~ 3.6V (Digital)
 - VCI = 2.5V ~ 3.6V (Analog)
- ◆ LCD Voltage drive:
 - Source/VCOM power supply voltage
 - DDVDH - GND = 4.5V ~ 6.0V
 - VCL - GND = -2.0~-3.0V
 - VCI1 - VCL 6.0V
 - Gate driver output voltage
 - VGH - GND = 10.0V ~ 20.0V
 - VGL - GND = -5.0V ~ -15.0V
 - VGH - VGL 32.0V
 - VCOM driver output voltage
 - VCOM = 0~2.0V
- ◆ Operate temperature range: -40°C to 85°C
- ◆ a-Si TFT LCD storage capacitor : Cst on Common structure only

3. Block Diagram

4. Pin Descriptions

Bus Interface Pins							
Pin Name	I/O	Type	Descriptions				
IM2,IM1,IM0	I	MPU IOVCC/DGND	- Select the interface mode				
			IM2	IM1	IM0	Interface	Data Pin in Use
			0	0	0	8080 18-bit bus interface	DB[17:0]
			0	0	1	8080 9-bit bus interface	DB[8:0]
			0	1	0	8080 16-bit bus interface	DB[15:0]
			0	1	1	8080 8-bit bus interface	DB[7:0]
			1	0	0	MDDI	MDDI_DATA_P MDDI_DATA_N MDDI_STB_P MDDI_STB_N
			1	0	1	3-line SPI	SDA
			1	1	0	MIPI DSI	MIPI_DATA_P, MIPI_DATA_N MIPI_CLOCK_P MIPI_CLOCK_N
1	1	1	4-line SPI	SDA			
RESX	I	MPU/ Reset circuit	- The external reset input. - Initializes the chip with a low input. Be sure to execute a power-on reset after supplying power.				
CSX	I	MPU	- A chip select signal. Low: the chip is selected and accessible High: the chip is not selected and not accessible Fix to IOVCC or DGND level when not in use.				
D/CX	I	MPU	- Parallel interface (D/CX): The signal for command or parameter select. Low: Command. High: Parameter. Fix to IOVCC or DGND level when not in use.				
WRX/SCL	I	MPU IOVCC	- 8080 system (WRX): Serves as a write signal and writes data at the rising edge. - 3/4-line serial interface (SCL): The pin used as serial clock pin. Fix to IOVCC or DGND level when not in use.				
RDX	I	MPU	- 8080 system (RDX): Serves as a read signal and read data at the rising edge. Fix to IOVCC or DGND level when not in use.				
DIN/SDA	I/O	MPU	- Serial data input / output. Fix to IOVCC or DGND level when not in use.				
DOUT	O	MCU	- Serial data output Leave the pin to open when not in use.				
TE	O	MPU	- Tearing effect output. Leave the pin to open when not in use.				
CABC_PWM	O	VCI	- Back light control pin. Leave the pin to open when not in use.				
CABC_ON	O	VCI	- Back light control pin. Leave the pin to open when not in use.				
MIPI_CLOCK_P /MDDI_STB_P	I	MIPI	- Positive polarity of low voltage differential clock signal				
MIPI_CLOCK_N /MDDI_STB_N	I	MIPI	- Negative polarity of low voltage differential clock signal				

MIPI_DATA_P /MDDI_DATA_P	I/O	MIPI	- Positive polarity of low voltage differential data signal														
MIPI_DATA_N /MDDI_DATA_N	I/O	MIPI	- Negative polarity of low voltage differential data signal														
DB[17:0]	I/O	MPU	- A 18-bit parallel bi-directional data bus for MCU system <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Interface Mode</th> <th>Data Pin in Use</th> </tr> </thead> <tbody> <tr> <td>8-bit MCU System Interface Mode</td> <td>DB[7:0]</td> </tr> <tr> <td>9-bit MCU System Interface Mode</td> <td>DB[8:0]</td> </tr> <tr> <td>16-bit MCU System Interface Mode</td> <td>DB[15:0]</td> </tr> <tr> <td>18-bit MCU System Interface Mode</td> <td>DB[17:0]</td> </tr> <tr> <td>16-bit RGB Interface Mode</td> <td>DB[15:0]</td> </tr> <tr> <td>18-bit RGB Interface Mode</td> <td>DB[17:0]</td> </tr> </tbody> </table> <p>Fix to DGND level when not in use.</p>	Interface Mode	Data Pin in Use	8-bit MCU System Interface Mode	DB[7:0]	9-bit MCU System Interface Mode	DB[8:0]	16-bit MCU System Interface Mode	DB[15:0]	18-bit MCU System Interface Mode	DB[17:0]	16-bit RGB Interface Mode	DB[15:0]	18-bit RGB Interface Mode	DB[17:0]
Interface Mode	Data Pin in Use																
8-bit MCU System Interface Mode	DB[7:0]																
9-bit MCU System Interface Mode	DB[8:0]																
16-bit MCU System Interface Mode	DB[15:0]																
18-bit MCU System Interface Mode	DB[17:0]																
16-bit RGB Interface Mode	DB[15:0]																
18-bit RGB Interface Mode	DB[17:0]																
VSYNC	I	MPU	- Frame synchronizing signal for RGB interface operation. Fix to DGND level when not in use.														
HSYNC	I	MPU	- Line synchronizing signal for RGB interface operation. Fix to DGND level when not in use.														
ENABLE	I	MPU	- Data enable signal for RGB interface operation. Low : access enabled. High : access inhibited. Fix to DGND level when not in use.														
DOTCLK	I	MPU	- Dot clock signal for RGB interface operation. Fix to IOVCC level when not in use.														

LCD Driving Signals			
Pin Name	I/O	Type	Descriptions
S961~S1	O	LCD	- Source output voltage signals applied to liquid crystal. Leave the pin to open when not in use.
G480~G1	O	LCD	- Gate line output signals. VGH: the level selecting gate lines VGL: the level not selecting gate lines Leave the pin to open when not in use.
VCOM	O	-	- The power supply of common voltage in DC VCOM driving. - The voltage range is set between -2V to 0V.
VREG1OUT	O	-	- Internal generated stable power for source driver unit. - The voltage level can be set by VRH1[4:0]. - VREG1OUT is a positive grayscale reference voltage of source driver. - VREG1OUT =3.6~5.5V
VREG2OUT	O	-	- Internal generated stable power for source driver unit. - The voltage level can be set by VRH2[4:0]. - VREG2OUT is a negative grayscale reference voltage of source driver. - VREG2OUT =-3.6~-5.5V
VGS	I	-	Reference level for grayscale generating circuit.

Charge-pump and Regulator Circuit			
Pin Name	I/O	Type	Descriptions
VCI	P	Power supply	- A supply voltage to the analog circuit. Connect to an external power supply of 2.5 ~ 3.6V.
DDVDH	O	Stabilizing capacitor	- Power supply for the source driver and VCOM driver. - Connect to a stabilizing capacitor between DDVDH and GND.
DDVDL	O	Stabilizing capacitor	- Power supply for the source driver and VCOM driver. - Connect to a stabilizing capacitor between DDVDL and

			GND.
VGH	O	Stabilizing capacitor	- Power supply for the gate driver. - Connect to a stabilizing capacitor between VGH and GND.
VGL	O	Stabilizing capacitor	- Power supply for the gate driver. . - Connect to a stabilizing capacitor between VGL and GND.
VCL	O	Stabilizing capacitor	- VCOML driver power supply. - VCL = 0.5 ~ -VCI, place a stabilizing capacitor between VCL and GND.
C11A, C11B C15A, C15B	O	Step-up capacitor	- Capacitor connection pins for the step-up circuit 1
C13A, C13B C21A, C21B C22A, C22B	O	Step-up capacitor	- Capacitor connection pins for the step-up circuit 2.

Power Pads			
Pin Name	I/O	Type	Descriptions
IOVCC	P	Power supply	- A supply voltage to the digital circuit. Connect to an external power supply of 1.65 ~ 3.6V.
VDD	O	Power	- Digital circuit power pad. Connect these pins with the 1uF capacitor.
N_VCORE	O	Power	- Digital circuit negative power pad. Connect these pins with the 1uF capacitor.
DGND	P	Power supply	- DGND for the digital side: DGND = 0V. In case of COG, connect to GND on the FPC to prevent noise.
AGND	P	Power supply	- AGND for the analog side: AGND = 0V. In case of COG, connect to GND on the FPC to prevent noise.
VPG	P	Power supply	- Power supply pin for the NV memory programming. Please provide 7 volt to this pin for NV memory programming.
MIPI_LDO	P	Stabilizing capacitor	- MIPI core power pad. - Connect to a stabilizing capacitor between MIPI_LDO and GND.

Test Pads			
Pin Name	I/O	Type	Descriptions
DUMMY	-	-	-- Dummy pad. Leave the pin to be open when not in use.
TS[2:0]	I	IOGND	- Test pins These pins are internal pulled low. Please leave these pins as open.
TEST[5:0] CABC_ON/TEST6 CABC_PWM/TEST7	O	-	-TEST[7:0]: When set in test mode, the pin are test pins. -CABC_ON: In normal mode, it's a LED driver control pin which Used for turning ON/OFF LED backlight. -CABC_PWM: In normal mode the PWM frequency output for LED driver control. Leave these pins to be open when not in use.
V1T V62T VWT	I	-	- Test pins. Leave these pins to be open when not in use.

Liquid crystal power supply specifications Table

No.	Item	Description	
1	TFT Source Driver	960 pins (320 x RGB)	
2	TFT Gate Driver	480 pins	
3	TFT Display's Capacitor Structure	Cst structure only (Cs on Common)	
4	Liquid Crystal Drive Output	S1 ~ S960	V0 ~ V63 grayscales
		G1 ~ G480	VGH – VGL
		VCOM	0~-2.0V
5	Input Voltage	IOVCC	1.65 ~ 3.60V
		VCI	2.50 ~ 3.60V
6	Liquid Crystal Drive Voltages	DDVDH	4.5V ~ 6.5V
		DDVDL	-6.5V ~ -4.5V
		VGH	10.0V ~ 20.0V
		VGL	-5.0V ~ -15.0V
		VCL	-1.9 ~ -3.0V
7	Internal Step-up Circuits	VGH – VGL	Max. 32.0V
		DDVDH	VCI1 X2
		DDVDL	-(VCI1-VCL)
		VGH	VCI1 x4, x5, x6
		VGL	VCI1 x-3, x-4, x-5
	VCL	VCI1 x-1	

5. Pad Arrangement and Coordination

- Chip Size: 22850um x 850um
- Chip thickness : 280um (typ.)
- Pad Location: Pad Center.
- Coordinate Origin: Chip center
- Au bump height: 15um (typ.)
- Au Bump Size:
 1. 15um x 110um
Gate: G1 ~ G480
Source: S1 ~ S961
 2. 50um x 70um
Input Pads
Pad 1 to 320.

6. Block Function Description

MCU System Interface

The ILI9486 supplies four kinds of MCU system interface with 8080-series parallel interface, 3-/4-line serial interface, MIPI DSI interface and MDDI interface. The selection of the given interfaces are done by external IM [2:0] pins and shown as below:

IM2	IM1	IM0	Interface	Data Pin in Use
0	0	0	8080 18-bit bus interface	DB[17:0]
0	0	1	8080 9-bit bus interface	DB[8:0]
0	1	0	8080 16-bit bus interface	DB[15:0]
0	1	1	8080 8-bit bus interface	DB[7:0]
1	0	0	MDDI	MDDI_DATA_P MDDI_DATA_N MDDI_STB_P MDDI_STB_N
1	0	1	3-line SPI	SDA
1	1	0	MIPI DSI	MIPI_DATA_P, MIPI_DATA_N MIPI_CLOCK_P MIPI_CLOCK_N
1	1	1	4-line SPI	SDA

ILI9486 has a 16-bit index register (IR), a 18-bit write-data register (WDR), and an 18-bit read-data register (RDR). The IR is the register to store index information from control registers and the internal GRAM. The WDR is the register to temporarily store data to be written to control registers and the internal GRAM. The RDR is the register to temporarily store data read from the GRAM. Data from the MPU to be written to the internal GRAM are first written to the WDR and then automatically written to the internal GRAM in internal operation. Data are read via the RDR from the internal GRAM. Therefore, invalid data are read out to the data bus when the ILI9486 read the first data from the internal GRAM. Valid data are read out after the ILI9486 performs the second read operation.

Register are written consecutively as the register execution time except starting oscillator takes 0 clock cycle.

8080-Series			Operation
D/CX	RDX	WRX	
"L"	"H"		Write command
"H"		"H"	Read parameter
"H"	"H"		Write parameter

Address Counter (AC)

The address counter (AC) gives an address to the internal GRAM. When the index of the register for setting a RAM address in the AC is written to the IR, the address information is sent from the IR to the AC. As writing data to the internal GRAM, the address in the AC is automatically updated plus or minus 1. The window address function enables writing data only in the rectangular area arbitrarily set by users on the GRAM.

Graphic RAM (GRAM)

The GRAM is graphics RAM storing bit-pattern data of 345,600 bytes with 18 bits per pixel, enabling a maximum 320(RGB) x480 dot graphic display.

Grayscale Voltage Generating Circuit

Grayscale voltage generating circuit generates a liquid crystal drive voltage, which corresponds to grayscale level set in the Gamma correction register. The ILI9486 can display 262k colors at the maximum.

Power Supply Circuit

The LCD drive power supply circuit generates the voltage levels as VREG1OUT, VGH, VGL and VCOM for driving TFT LCD panel.

Timing Generating

The timing generator generates timing signals for internal circuits such as the internal GRAM. The timing for display operation such as RAM read operation and the timing for internal operation such as RAM access by MPU is outputted separately so that they do not interfere with each other.

Oscillator

The ILI9486 incorporates RC oscillator circuit. The frame frequency is changeable by command settings.

Panel Driver Circuit

The liquid crystal display driver circuit consists of a 960-output source drivers (S1~S960) and a 480-output gate driver (G1~G480).

MIPI Controller Circuit

The MIPI controller circuit consists of D-PHY controller, protocol control unit (PCU), packet processing unit (PPU), ECC generating circuit, Internal data / command buffer and analog transceiver. The D-PHY controller is in charge of the communication with the analog block and ECC generating circuit will generate the ECC for outgoing data stream to accuracy of receiving data packet. The PCU is used to handle of outgoing and incoming data stream and PPU is charge of the transmitting packet distribution and merging. The internal data and command buffer is used as temporary storage for incoming command and display data.

7. Function Description

7.1. MCU interfaces

ILI9486 provides the 18-/16-/9-/8-bit parallel system interface for 8080 series, and 3-/4-line serial system interface for serial data input. The input system interface is selected by external pins as IM [2:0] and the bit format per pixel color order is selected by DBI [2:0] bits.

7.1.1. MCU interface selection

The selection of a given interfaces are done by setting external pins IM [2:0] as show in the following table.

IM2	IM1	IM0	Interface	Data Pin in Use
0	0	0	8080 18-bit bus interface	DB[17:0]
0	0	1	8080 9-bit bus interface	DB[8:0]
0	1	0	8080 16-bit bus interface	DB[15:0]
0	1	1	8080 8-bit bus interface	DB[7:0]
1	0	0	MDDI	MDDI_DATA_P MDDI_DATA_N MDDI_STB_P MDDI_STB_N
1	0	1	3-line SPI	SDA
1	1	0	MIPI DSI	MIPI_DATA_P, MIPI_DATA_N MIPI_CLOCK_P MIPI_CLOCK_N
1	1	1	4-line SPI	SDA

7.1.2. 8080-Series Parallel Interface

ILI9486 can be accessed via 8-/9-/16-/18-bit MCU 8080-series parallel interface. The chip-select CSX (active low) is used to enable or disable ILI9486 chip. The RESX (active low) is an external reset signal. WRX is the parallel data write strobe, RDX is the parallel data read strobe and DB[17:0] is parallel data bus.

The MCU latches the input data at the rising edge of WRX signal. The D/CX is the signal of data/command selection. When D/CX='1', DB[17:0] bits are display RAM data or command parameters. When D/CX='0', DB[17:0] bits are commands.

The 8080-series bi-directional interface can be used for communication between the MCU controller and LCD driver chip. The selection of 8080-series parallel interface is shown as the table in the following.

IM2	IM1	IM0	MPU-Interface Mode	WRX	RDX	D/CX	Function
0	0	0	8080 MCU 18-bit bus interface		"H"	"L"	Write command code.
				"H"		"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
				"H"		"H"	Reads parameter or display data.
0	0	1	8080 MCU 9-bit bus interface		"H"	"L"	Write command code.
				"H"		"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
				"H"		"H"	Reads parameter or display data.
0	1	0	8080 MCU 16-bit bus interface		"H"	"L"	Write command code.
				"H"		"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
				"H"		"H"	Reads parameter or display data.
0	1	1	8080 MCU 8-bit bus interface		"H"	"L"	Write command code.
				"H"		"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
				"H"		"H"	Reads parameter or display data.

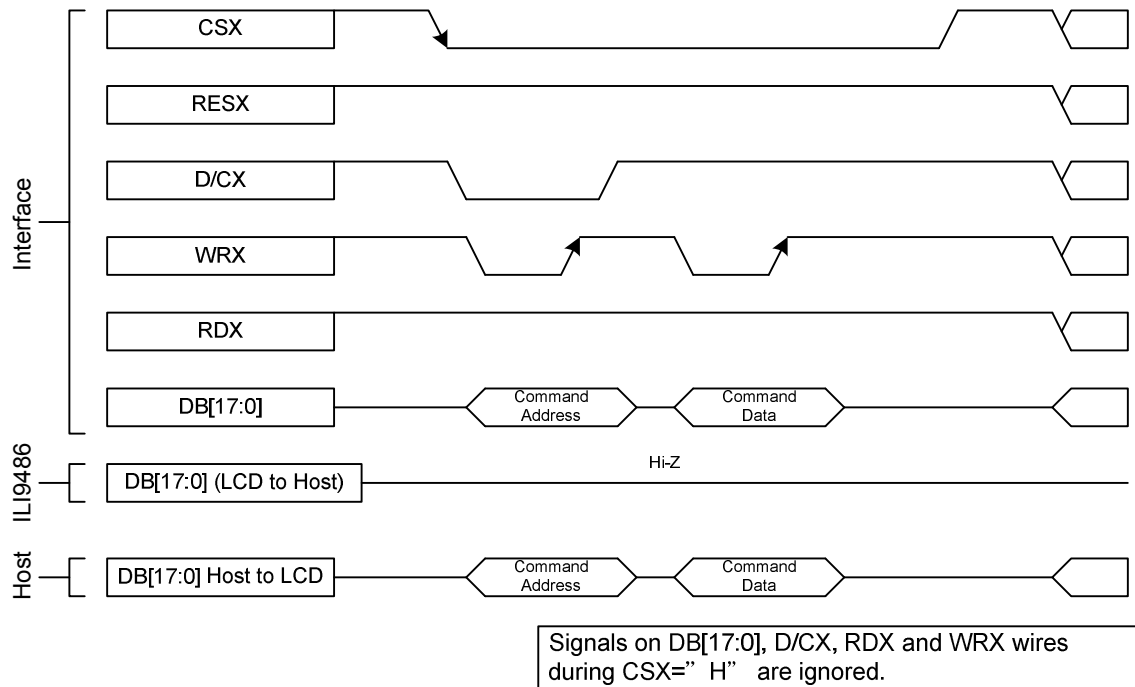

7.1.2.1. Write Cycle Sequence

The WRX signal is driven from high to low then pulled back to high during the write cycle. The host processor provides information during the write cycle when the display module captures the information from host processor on the rising edge of WRX. When the D/CX signal is driven to low level, then input data on the interface is interpreted as command information. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command parameter.

The following figure shows a write cycle for the 8080 MCU interface.

Note: WRX is an unsynchronized signal (It can be stopped)

7.1.2.2. Read Cycle Sequence

The RDX signal is driven from high to low then allowed to be pulled back to high during the read cycle. The display module provides information to the host processor during the read cycle while the host processor reads the display module information on the rising edge of RDX signal. When the D/CX signal is driven to low level, then input data on the interface is interpreted as internal status or parameter. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command parameter.

The following figure shows the read cycle for the 8080 MCU interface.

Note: RDX is an unsynchronized signal (It can be stopped).

Note: Read Data is only valid when the D/CX input is pulled high. If D/CX is driven low during read then the display information outputs will be High-Z.

7.1.3. Serial Interface

The selection of this interface is done by IM [2:0] bits. Please refer to the Table in the following.

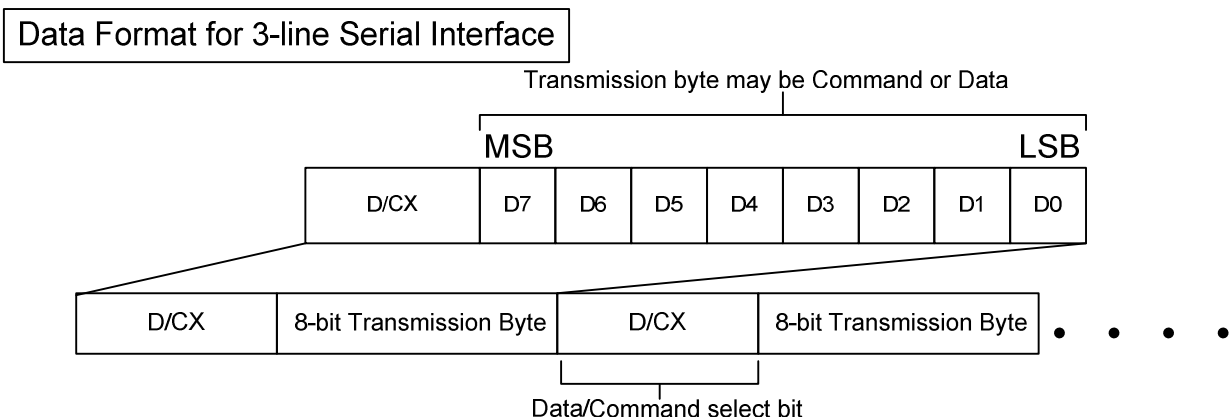

IM2	IM1	IM0	MPU-Interface Mode	CSX	D/CX	SCL	Function
1	0	1	3-line serial interface	"L"	-	┌	Read/Write command, parameter or display data.
1	1	1	4-line serial interface	"L"	"L"/"H"	┌	Read/Write command, parameter or display data.

The ILI9486 supplies 3-lines/ 9-bit and 4-line/8-bit bi-directional serial interfaces for communication between the host and ILI9486. The 3-line serial mode consists of the chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA). The 4-line serial mode consists of the Data/Command selection input (D/CX), chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA) for data transmission. The data bus (D [17:0]) which are not used, must be leave these unused pins to open. Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

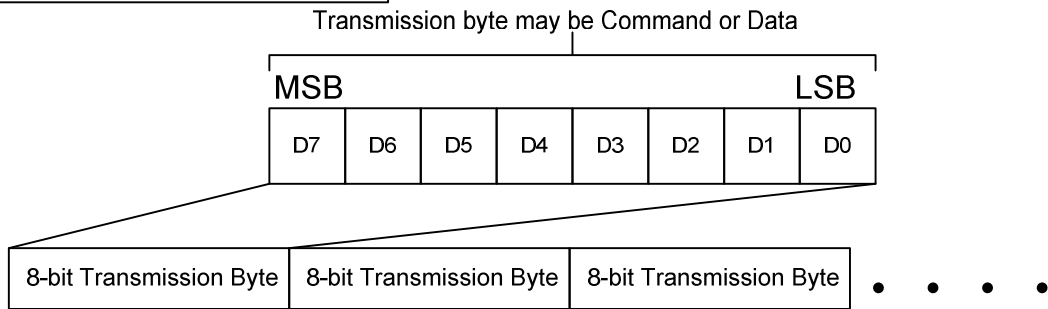

7.1.3.1. Write Cycle Sequence

The write mode of the interface means the host writes commands and data to ILI9486. The 3-lines serial data packet contains a data/command select bit (D/CX) and a transmission byte. If D/CX is "low", the transmission byte is interpreted as a command byte. If D/CX is "high", the transmission byte is stored in the display data RAM (Memory write command), or command register as parameter.

Any instruction can be sent in any order to the ILI9486 and the MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse and SDA data are no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. See the detail of data format for 3-/4-line serial interface.

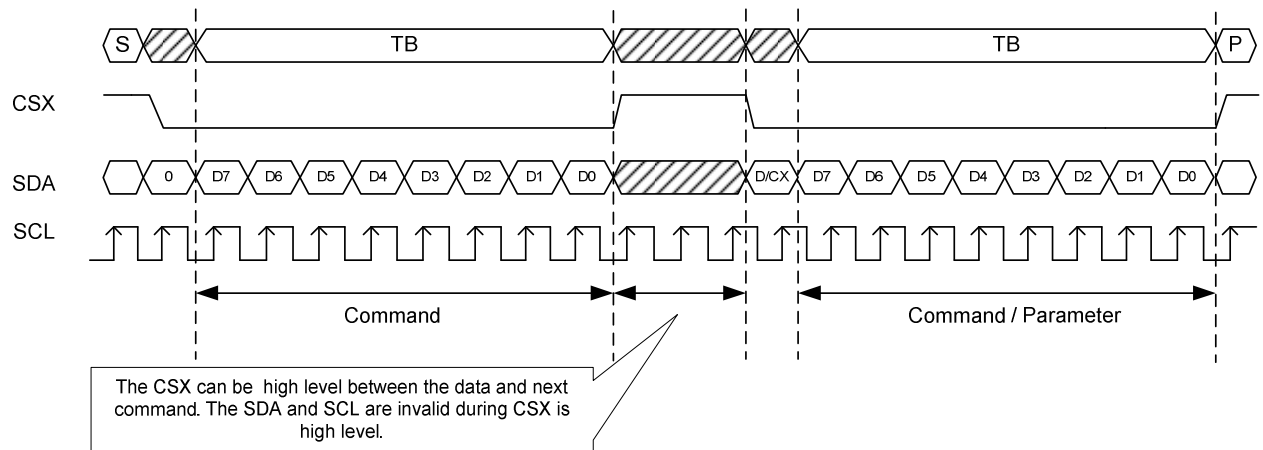

Data Format for 4-line Serial Interface

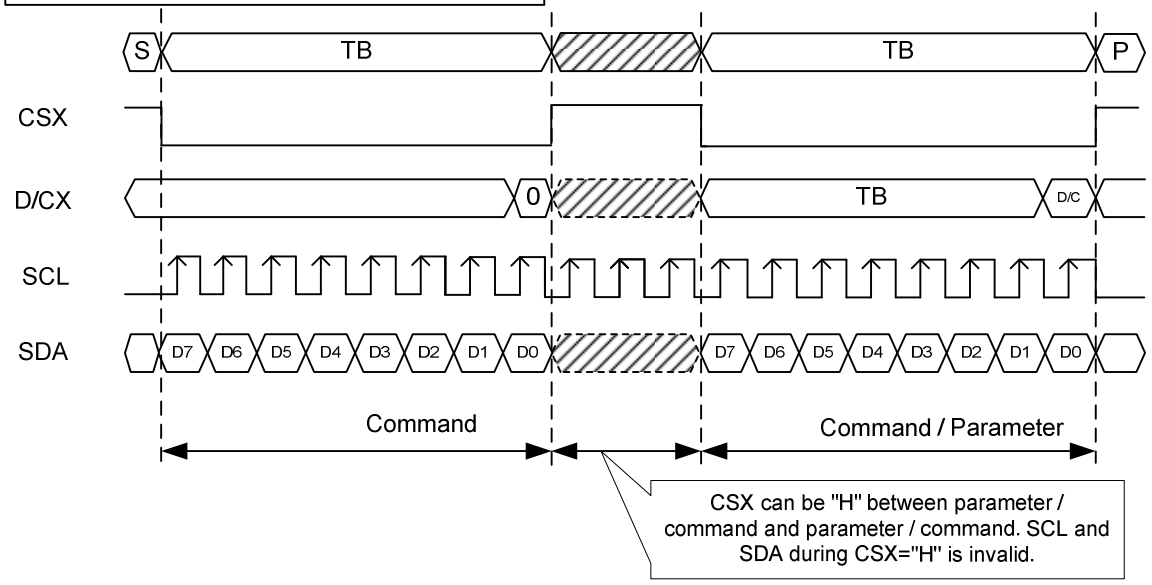

The host drives the CSX pin to low and starts by setting the D/CX bit on SDA. The bit is read by ILI9486 on the first rising edge of SCL signal. On the next falling edge of SCL, the MSB data bit (D7) is set on SDA by the host. On the next falling edge of SCL the next bit (D6) is set on SDA. If the optional D/CX signal is used, a byte is eight read cycle long. The 3/4-line serial interface writes sequence described in the Figure as below.

3-line Serial Interface Protocol

4-line Serial Interface Protocol

7.1.3.2. Read Cycle Sequence

The read mode of the interface means that the host reads register value from ILI9486. The host has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. The ILI9486 samples the SDA (input data) at the rising edges of SCL (serial clock), but shifts SDA (output data) at falling edges of SCL (serial clock). After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit. The read mode has three types of transmitted command data (8-/24-/32-bit) according command code.

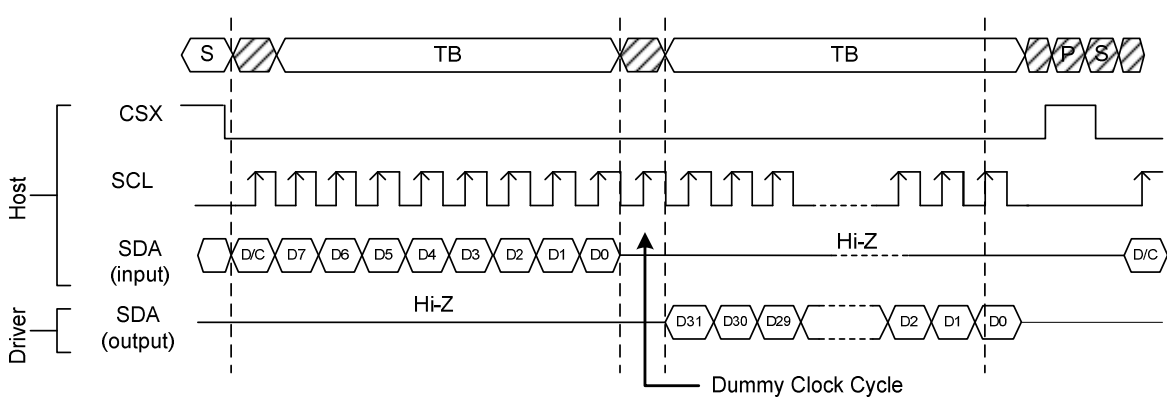

3-line Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command: 8-bit read)

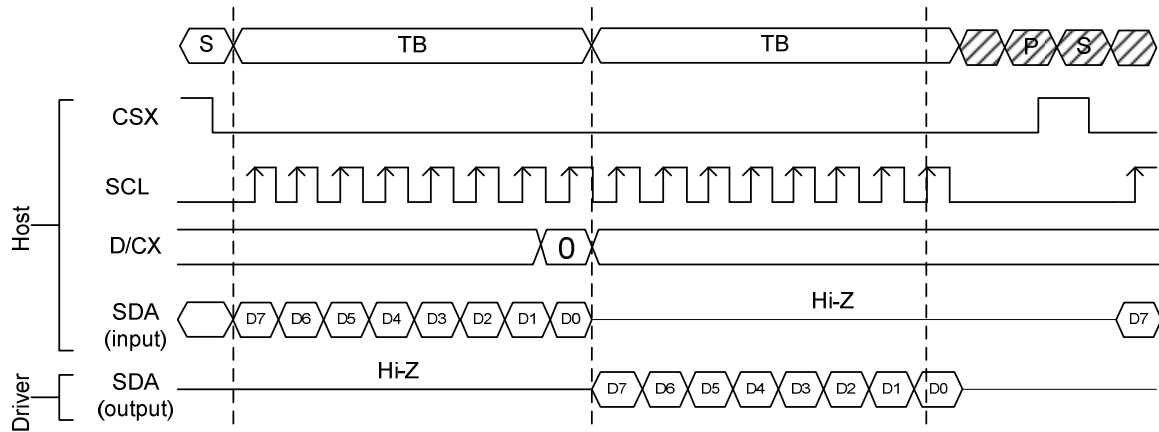

3-line Serial Protocol (for RDDID command: 24-bit read)

3-line Serial Protocol (for RDDST command: 32-bit read)

4-line Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command: 8-bit read)

4-line Serial Protocol (for RDDID command: 24-bit read)

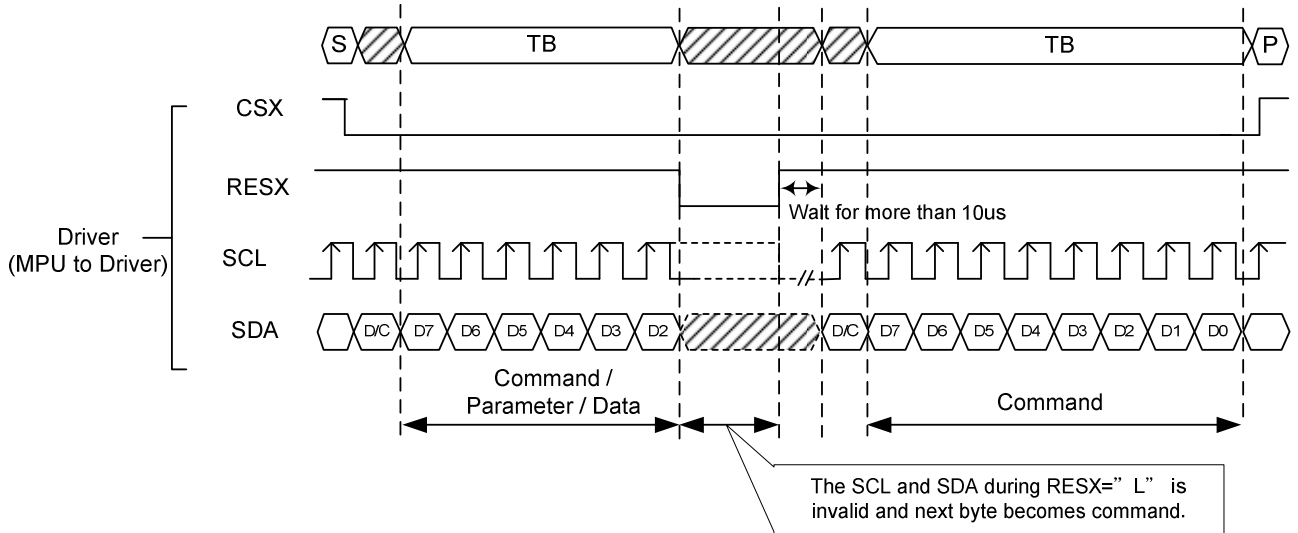

4-line Serial Protocol (for RDDST command: 32-bit read)

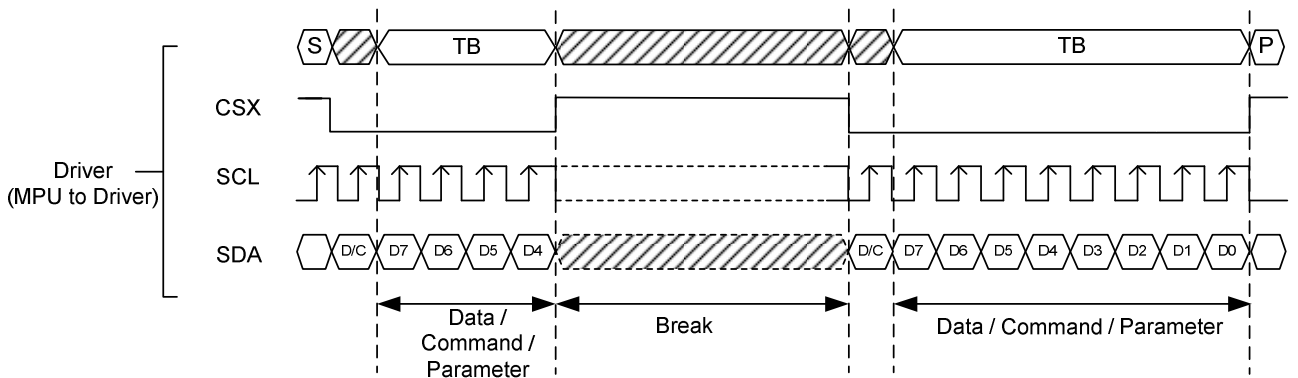

7.1.4. Data Transfer Break and Recovery

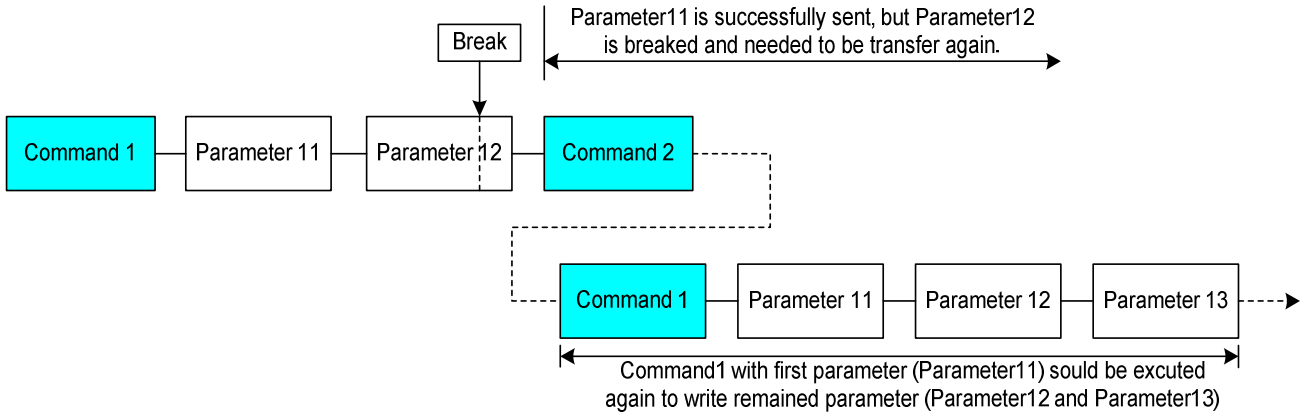

If there is a break in data transmission by RESX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select pin (CSX) is next activated after RESX have been High state.

If there is a break in data transmission by CSX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select pin (CSX) is next activated.

If a two or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than continue to send the remained parameters that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

If a two or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

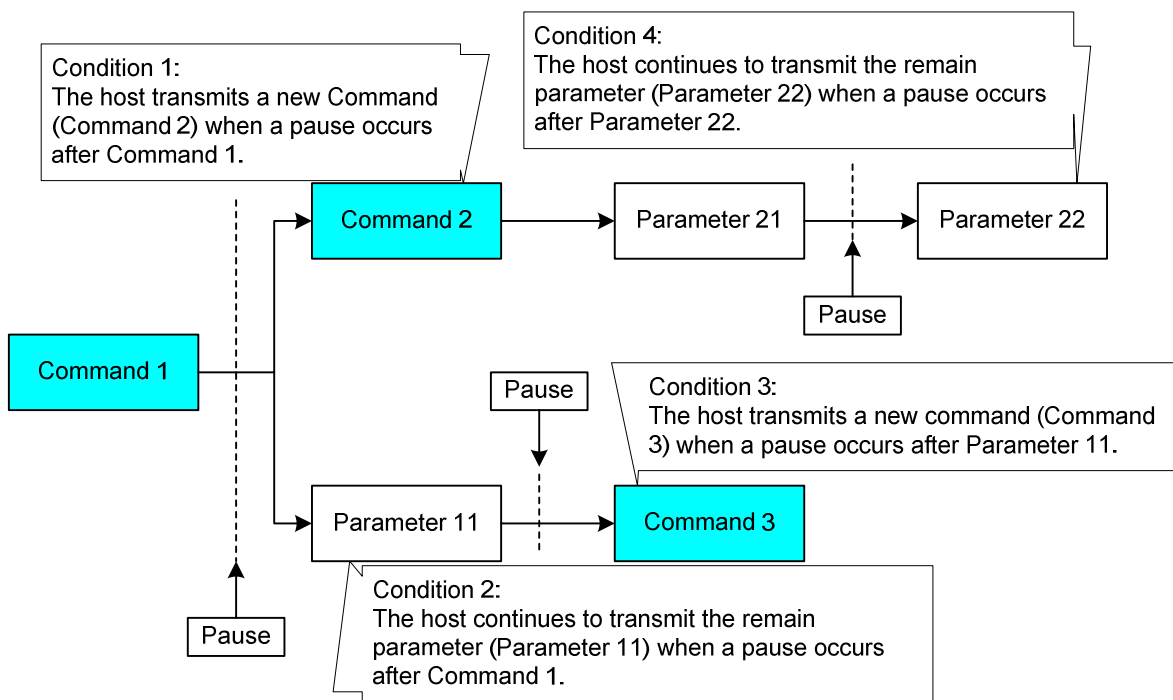

7.1.5. Data Transfer Pause

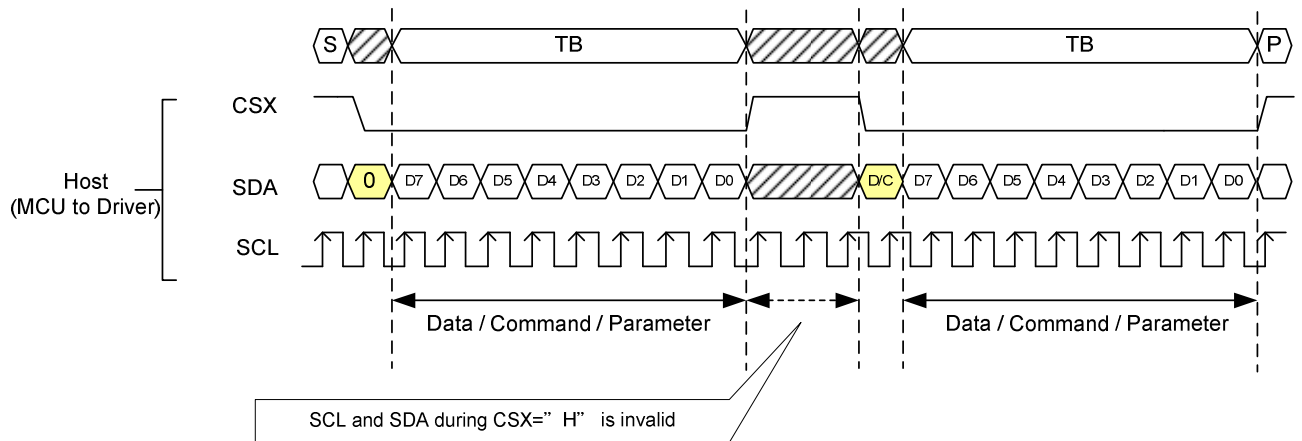

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select pin (CSX) is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then ILI9486 will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select pin is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below.

This applies to the following 4 conditions:

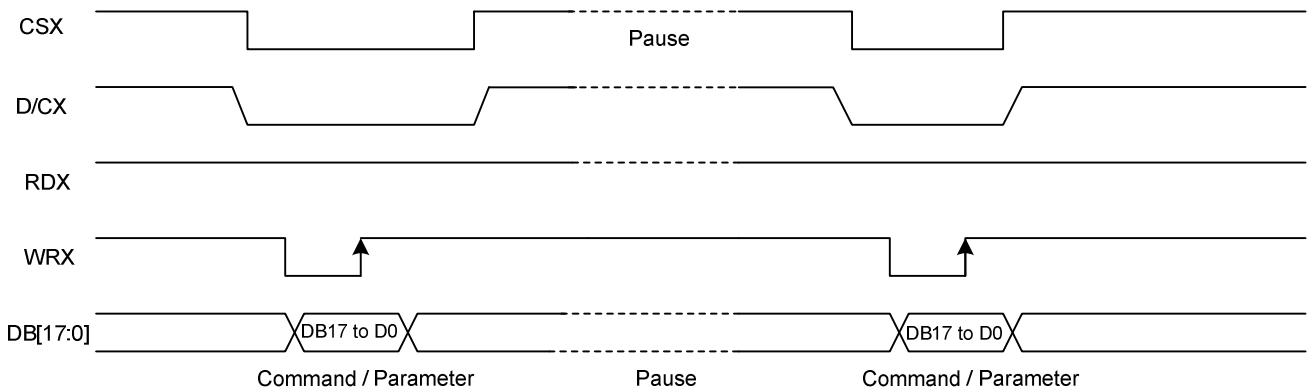

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

7.1.5.1. Serial Interface Pause

7.1.5.2. Parallel Interface Pause

7.1.6. Data Transfer Mode

ILI9486 can provide four different kinds of color depth (8-bit/pixel, 9-bit/pixel, 16-bit/pixel and 18-bit/pixel) display data to the graphic RAM. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

7.1.6.1. Method 1

The Image data is sent to the Frame Memory in the successive Frame writing, each time the Frame Memory is filled by image data, the Frame Memory pointer is reset to the start point and the next Frame is written.

7.1.6.2. Method 2

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Writing. Then Start Memory Write command is sent, and a new Frame is downloaded.

Note 1: These apply to all data transfer Color modes on both serial and parallel interfaces.

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

7.2. RGB Interface

7.2.1. RGB Interface Selection

The ILI9486 has the RGB interface and these interfaces can be selected by RCM bit. When RCM is set to “0”, the DE mode is selected which utilizes VSYNC, HSYNC, DOTCLK, DE, D [17:0] pins; when RCM is set to “1”, the SYNC mode is selected which utilizes which utilizes VSYNC, HSYNC, DOTCLK, D [17:0] pins. The ILI9486 supports several pixel format that can be selected by DPI[3:0] bits in “Pixel Format Set (3Ah)” command. The selection of a given interfaces are done by DPI[3:0] as show in the following table.

RCM	DPI[2:0]			RGB Interface Mode	RGB Mode	Used Pins
0	0	1	1	0	DE Mode Valid data is determined by the DE signal	VSYNC, HSYNC, DE, DOTCLK, D[17:0]
0	0	1	0	1		VSYNC, HSYNC, DE, DOTCLK, D[15:0]
1	0	1	1	0	SYNC Mode In SYNC mode, DE signal is ignored; blanking porch is determined by B5h command.	VSYNC, HSYNC, DOTCLK, D[17:0]
1	0	1	0	1		VSYNC, HSYNC, DOTCLK, D[15:0]

18bit DPI Interface Connection: set_pixel_format D[6:4]=3'h6 : 18bpp

16bit DPI Interface Connection: set_pixel_format D[6:4]=3'h5 : 16bpp

Pixel clock (DOTCLK) is running all the time without stopping and it is used to entering VSYNC, HSYNC, ENABLE and DB[17:0] states when there is a rising edge of the DOTCLK. The DOTCLK can not be used as continues internal clock for other functions of the display module.

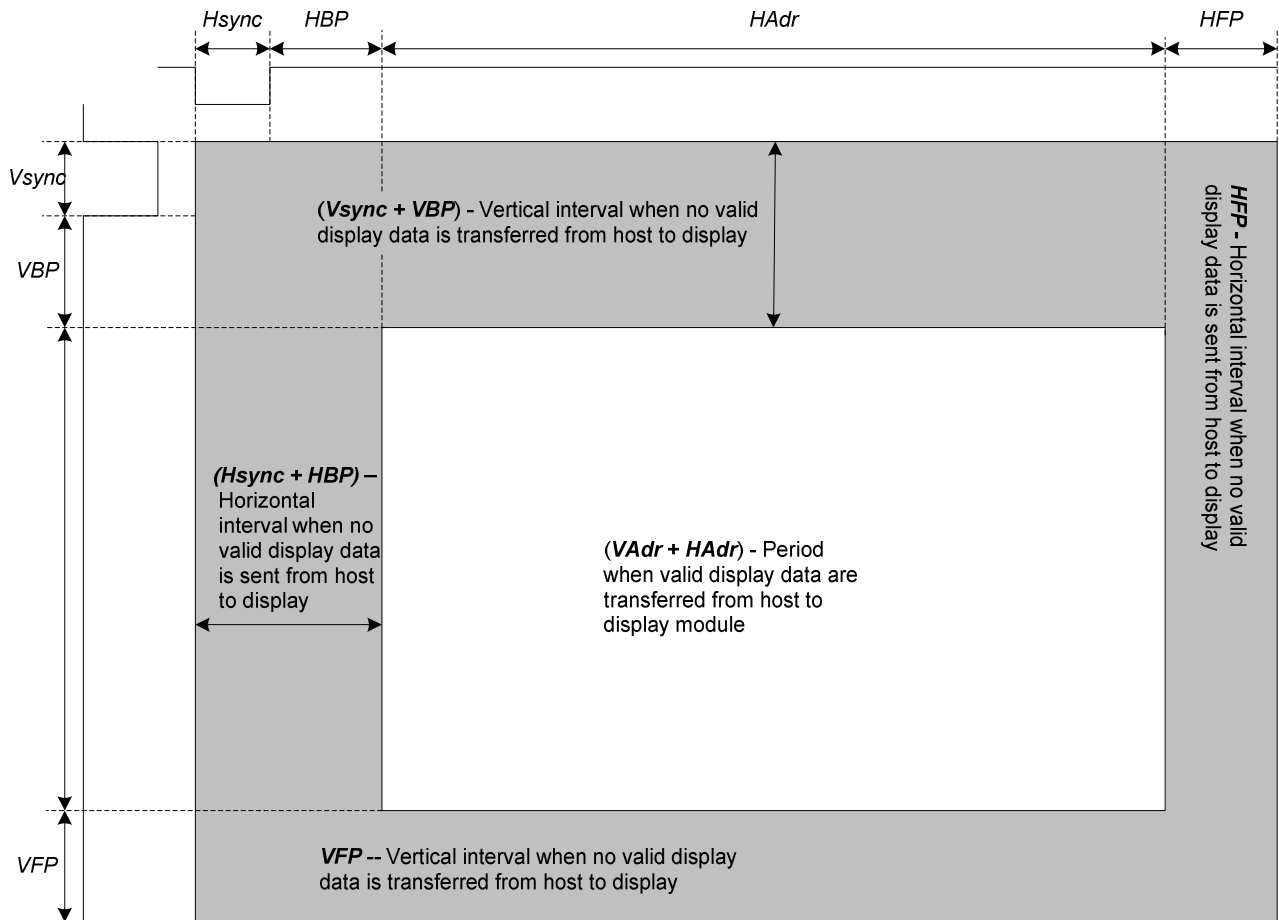

Vertical synchronization (VSYNC) is used to tell when there is received a new frame of the display. This is low enable and its state is read to the display module by a rising edge of the DOTCLK signal.

Horizontal synchronization (HSYNC) is used to tell when there is received a new line of the frame. This is low enable and its state is read to the display module by a rising edge of the DOTCLK signal.

Data Enable (ENABLE) is used to tell when there is received RGB information that should be transferred on the display. This is a high enable and its state is read to the display module by a rising edge of the DOTCLK signal.

DB[17:0] are used to tell what is the information of the image that is transferred on the display (When

ENABLE= '0' (low) and there is a rising edge of DOTCLK). DB[17:0] can be '0' (low) or '1' (high). These lines are read by a rising edge of the DOTCLK signal. In RGB interface modes, the input display data is written to GRAM first then outputs corresponding source voltage according the gray data from GRAM.

7.2.2. RGB Interface Timing

The timing chart of 18-/16-bit RGB interface mode is shown as below.

VLW : VSYNC Low Width
HLW : HSYNC Low Width
DTST : Data Transfer Startup Time

Note 1: The DE signal is not needed when RGB interface SYNC mode is selected.

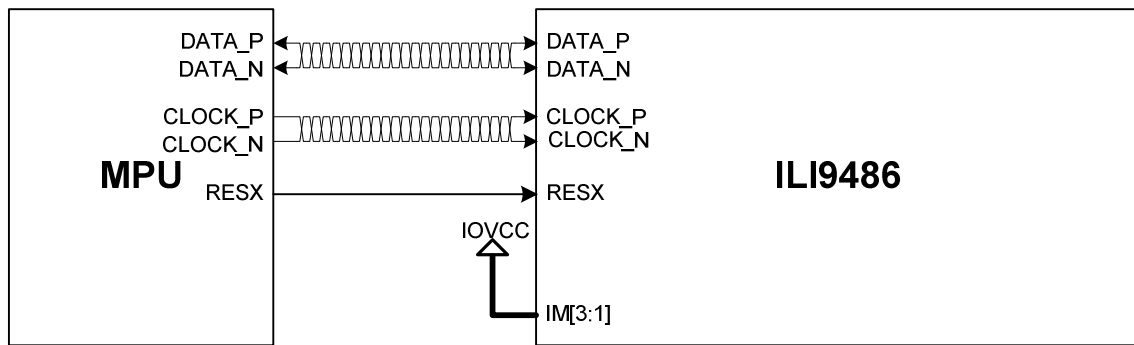

Note 2: VSPL='0', HSPL='0', DPL='0' and EPL='0' of "Interface Mode Control (B0h)" command.

7.3. MIPI – DSI (Mobile Industry Processor Interface – Display Serial Interface)

ILI9486 supports MIPI DSI which can be enabled or disabled by external IM [4] pin. ILI9486 can be accessed through one PHY lane module which communicates via two lines to a complementary part at the other side of the lane interconnects. The communication can be separated two different levels between the MCU and ILI9486:

- Low level communication what is done on the interface level.
- High level communication what is done on the packet level.

ILI9486 uses data and clock lane differential pairs for DSI, The data lane (DATAP and DATAN) is used for data communication and clock lane (CLKP and CLKN) is used to transmit the clock signal. The Mobile Industry Processor Interface (MIPI) can be used for communication between the processor and DSI-compliant LCD driver chip. The selection of this interface is done when IM [3:1] pins are high state (IOVCC level).

Low Power mode means that each line of the differential pair is used in single end mode and a differential receiver is disabled (A termination resistor of the receiver is disabled) and it can be driven into a low power mode. High Speed mode means that differential pairs (The termination resistor of the receiver is enabled) are not used in the single end mode.

There are used different modes and protocols in each mode when there are wanted to transfer information from the MCU to ILI9486 and vice versa.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair are defined below.

Lane Pair State Code	Line DC Voltage Levels		High Speed (HS)	Low Power	
	DATA_P	DATA_N	Burst Mode	CLOCK_P	CLOCK_N
HS-0	Low (HS)	High (HS)	Differential – 0	Note 1	Note1
HS-1	High (HS)	Low (HS)	Differential – 1	Note 1	Note 1
LP-00	Low (LP)	Low (LP)	Not Defined	Bridge	Space
LP-01	Low (LP)	High (LP)	Not Defined	HS – Request	Mark - 0
LP-10	High (LP)	Low (LP)	Not Defined	LP - Request	Mark - 1
LP-11	High (LP)	High (LP)	Not Defined	Stop	Note 2

Notes: (1) Low-Power Receivers (LP-Rx) of the lane pair are checking the LP-00 state code, when the Lane Pair is in the High Speed (HS) mode.

(2). If Low-Power Receivers (LP-Rx) of the lane pair recognizes LP-11 state code, the lane pair returns to LP-11 of the Control Mode.

7.3.1. Interface Level Communication – Clock Lanes

DSI-CLOCK_P/N lanes can be driven into three different power modes:

- Low Power Mode (LPM)
- Ultra Low Power Mode (ULPM)
- High Speed Clock Mode (HSCM)

Clock lanes are in a single end mode (LP = Low Power) when there is entering or leaving Low Power Mode (LPM) or Ultra Low Power Mode (ULPM).

Clock lanes are in the single end mode (LP = Low Power) when there is entering in or leaving out High Speed Clock Mode (HSCM).

These entering and leaving protocols are using clock lanes in the single end mode to generate an entering or leaving sequences.

The principal flow chart of the different clock lanes power modes is illustrated below.

7.3.1.1. Low Power Mode (LPM)

DSI-CLOCK_P/N lanes can be driven to the Low Power Mode (LPM), when DSI-CLOCK lanes are entering LP-11 State Code, in three different ways:

- 1) After SW Reset, HW Reset or Power On Sequence =>LP-11
- 2) After DSI-CLOCK_P/N lanes are leaving Ultra Low Power Mode (ULPM, LP-00 State Code) =>LP-10 =>LP-11 (LPM). This sequence is illustrated below.

- 3) After DSI-CLK+/- lanes are leaving High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) =>HS-0 =>LP-11 (LPM). This sequence is illustrated below.

All three mode changes are illustrated a flow chart below.

7.3.1.2. Ultra Low Power Mode (ULPM)

DSI-CLOCK_P/N lanes can be driven to the Ultra Low power Mode (ULPM), when DSI-CLOCK lanes are entering LP-00 State Code.

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-10 =>LP-00 (ULPM).

This sequence is illustrated below.

The mode change is also illustrated below.

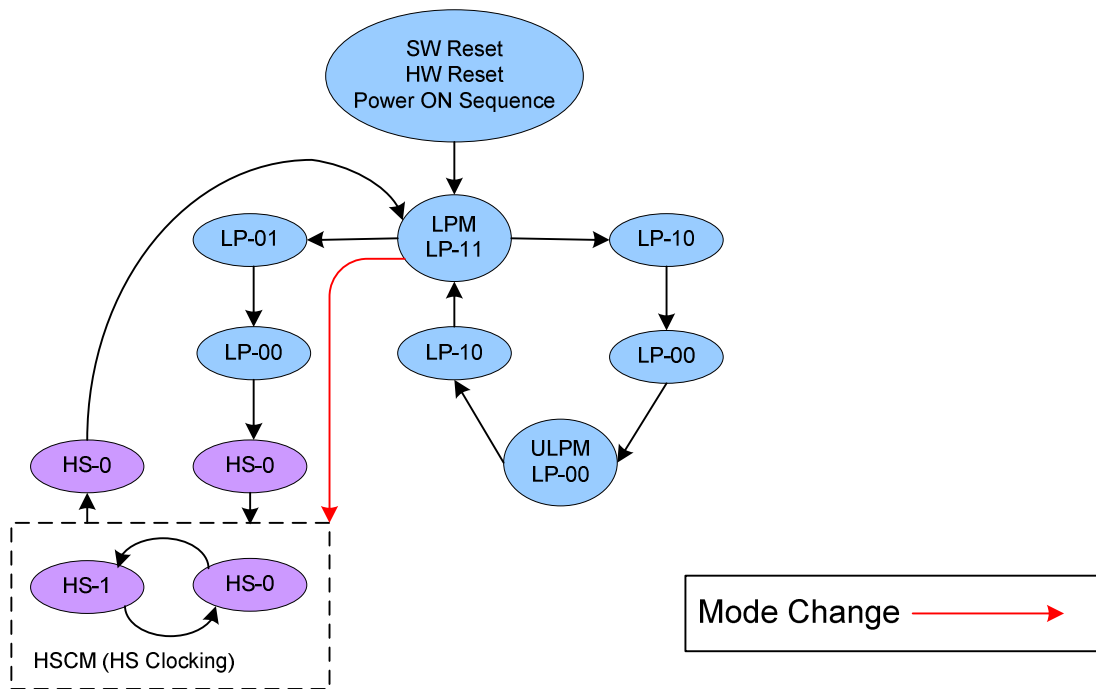

7.3.1.3. High-Speed Clocked Mode (HSCM)

DSI-CLOCK_P/N lanes can be driven to the High Speed Clock Mode (HSCM), when DSI-CLOCK lanes are starting to work between HS-0 and HS-1 State Codes.

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-01 =>LP-00 =>HS-0 =>HS-0/1 (HSCM). This sequence is illustrated below.

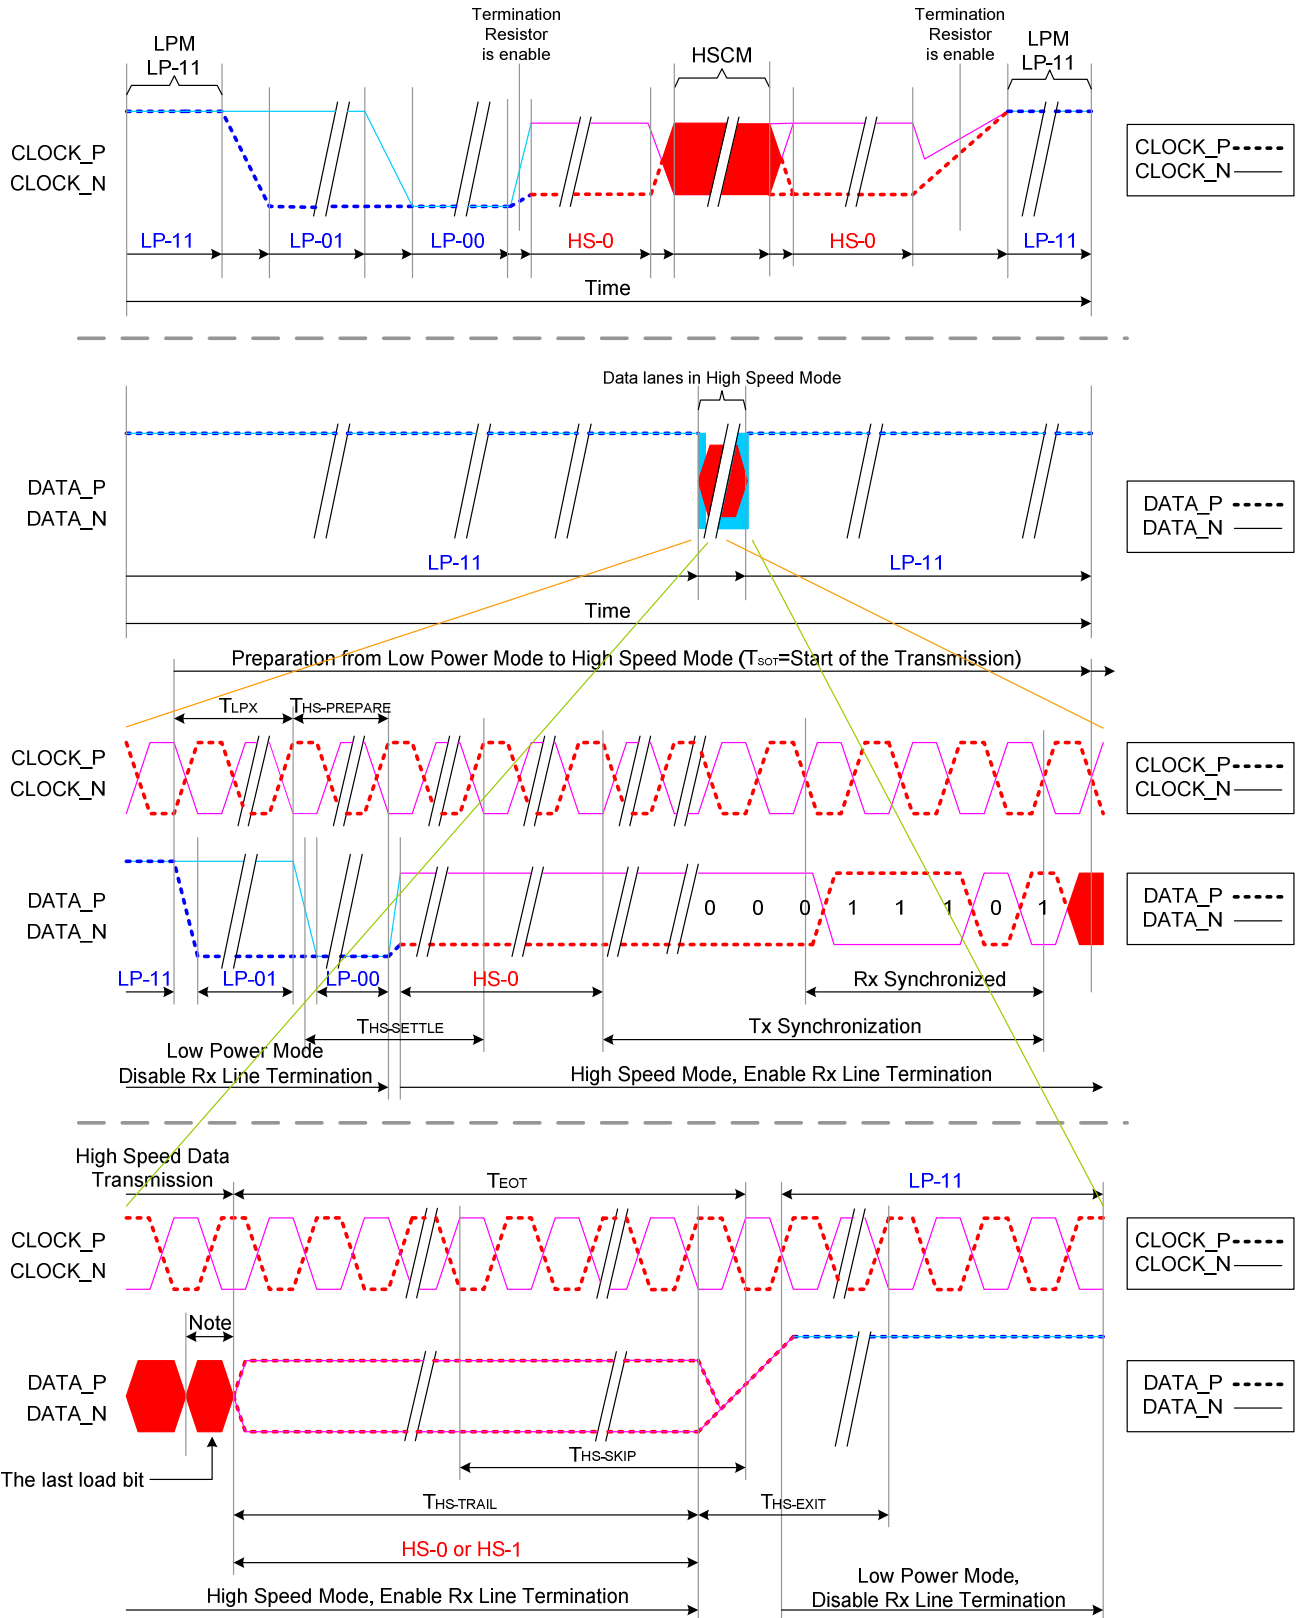

The mode change is also illustrated below.

The high speed clock (DSI-CLOCK_P/N) is started before high speed data is sent via DSI-DATA_P/N lanes. The high speed clock continues clocking after the high speed data sending has been stopped. The burst of the high speed clock consists of:

- Even number of transitions
- Start state is HS-0
- End state is HS-0

- Notes: 1. If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.
2. If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.

7.3.2. Interface Level Communication – Data Lanes

DSI-DATA_P/N Data Lanes can be driven in different modes which are:

- Escape Mode
- High-Speed Data Transmission
- Bus Turnaround Request

These modes and their entering codes are defined on the following table.

Mode	Entering Mode Sequence	Leaving Mode Sequence
Escape Mode	LP-11 → LP-10 → LP-00 → LP-01 → LP-00	LP-00 → LP-10 → LP-11 (Mark-1)
High-Speed Data Transmission	LP-11 → LP-01 → LP-00 → HS-0	(HS-0 or HS-1) → LP-11
Bus Turnaround Request	LP-11 → LP-10 → LP-00 → LP-10 → LP-00	Hi-Z

7.3.2.1. Escape Modes

Data lanes (DSI-DATA_P/N) can be used in different Escape Modes when data lanes are in Low Power (LP) mode.

These Escape Modes are used to:

- Send “Low-Power Data Transmission” (LPDT) e.g. from the MCU to ILI9486,
- Drive data lanes to “Ultra-Low Power State” (ULPS),
- Indicate “Remote Application Reset” (RAR), which is resetting ILI9486,
- Indicate “Tearing Effect” (TEE), which is used for a TE line event from ILI9486 to the MCU,
- Indicate “Acknowledge” (ACK), which is used for a non-error event from ILI9486 to the MCU.

The basic sequence of the Escape Mode is as follow

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Escape Command (EC), which is coded, when one of the data lanes is changing from low-to-high-to-low then this changed data lane is presenting a value of the current data bit (DSI-DATA_P = 1, DSI-DATA_N = 0) e.g. When DSI-DATA_N is changing from low-to-high-to-low, the receiver is latching a data bit, which value is logical 0. The receiver is using this low-to-high-to-low transition for its internal clock.
- A load if it is needed
- Exit Escape (Mark-1) LP-00 =>LP-10 =>LP-11
- End: LP-11

This basic construction is illustrated below:

There are a total of eight Escape Command(EC) divided into two types, Modes and Triggers(see below table),

An example of a Mode type Escape Command is “Ultra-Low Power Mode” where the MCU instructs the display module to enter it’s Ultra-Low Power Mode.

An example of Trigger type Escape Command is ‘Tearing Effect’. In this case the MCU has already instructed The display module to provide this trigger and is waiting for the reponse. The display module then sends a TE Trigger(TEE) on the next V-sync event.

Escape commands are defined on the next table.

Escape command	Command Type Mode / Trigger	Entry command Pattern (First → Last Bit Transmitted)
Low-Power Data Transmission	Mode	1110 0001 b
Ultra-Low Power Mode	Mode	0001 1110 b
Undefined-1, Note	Mode	1001 1111 b
Undefined-2, Note	Mode	1101 1110 b
Remote Application Reset	Trigger	0110 0010 b
Tearing Effect	Trigger	0101 1101 b
Acknowledge	Trigger	0010 0001 b
Uknown-5, Note	Trigger	1010 0000 b

Note: This Escape command support has not been implemented on ILI9486.

7.3.2.1.1. Low-Power Data Transmission (LPDT)

The MCU can send data to ILI9486 in Low-Power Data Transmission (LPDT) mode when data lanes are entering in Escape Mode and Low-Power Data Transmission (LPDT) command has been sent to ILI9486. ILI9486 is also using the same sequence when it is sending data to the MCU.

The Low Power Data Transmission (LPDT) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Low-Power Data Transmission (LPDT) command in Escape Mode: 1110 0001 (First to Last bit)
- Load (Data):
 - One or more bytes (8 bit)
 - Data lanes are in pause mode when data lanes are stopped (Both lanes are low) between bytes
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

Note: Load (Data) is presenting that the first bit is logical '1' in this example.

7.3.2.1.2. Ultra-Low Power State (ULPS)

The MCU can force data lanes in Ultra-Low Power State (ULPS) mode when data lanes are entering in Escape Mode.

The Ultra-Low Power State (ULPS) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Ultra-Low Power State (ULPS) command in Escape Mode: 0001 1110 (First to Last bit)
- Ultra-Low Power State (ULPS) when the MCU is keeping data lanes low
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

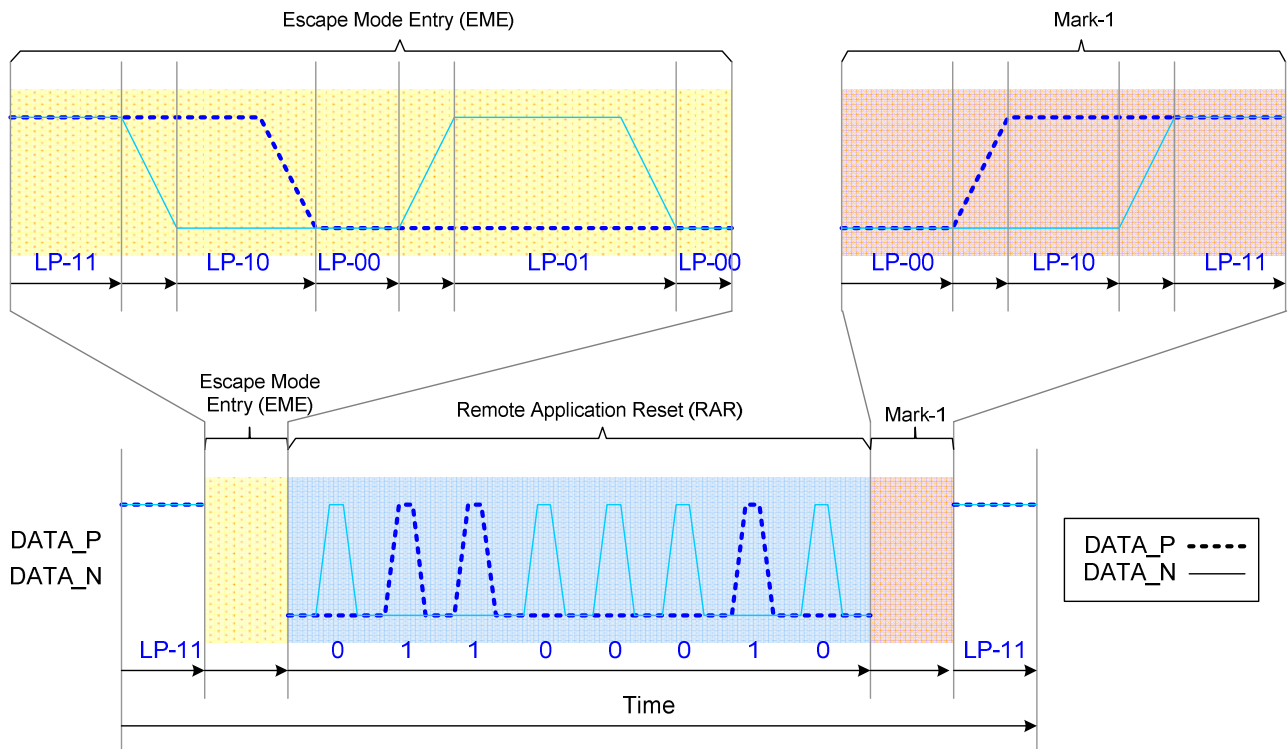

7.3.2.1.3. Remote Application Reset (RAR)

The MCU can inform to ILI9486 that it should be reset in Remote Application Reset (RAR) trigger when data lanes are entering in Escape Mode.

The Remote Application Reset (RAR) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Remote Application Reset (RAR) command in Escape Mode: 0110 0010 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

7.3.2.1.4. Tearing Effect (TEE)

ILI9486 can inform to the MCU when a tearing effect event (New V-synch) has been happen on the display module by Tearing Effect (TEE).

The Tearing Effect (TEE) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Tearing Effect (TEE) trigger in Escape Mode: 0101 1101 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

7.3.2.1.5. Acknowledge (ACK)

ILI9486 can inform to the MCU when an error has not recognized on it by Acknowledge (ACK).

The display module is sending the Acknowledge (ACK) what is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Acknowledge (ACK) command in Escape Mode: 0010 0001 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

7.3.2.2. High-Speed Data Transmission (HSDT)

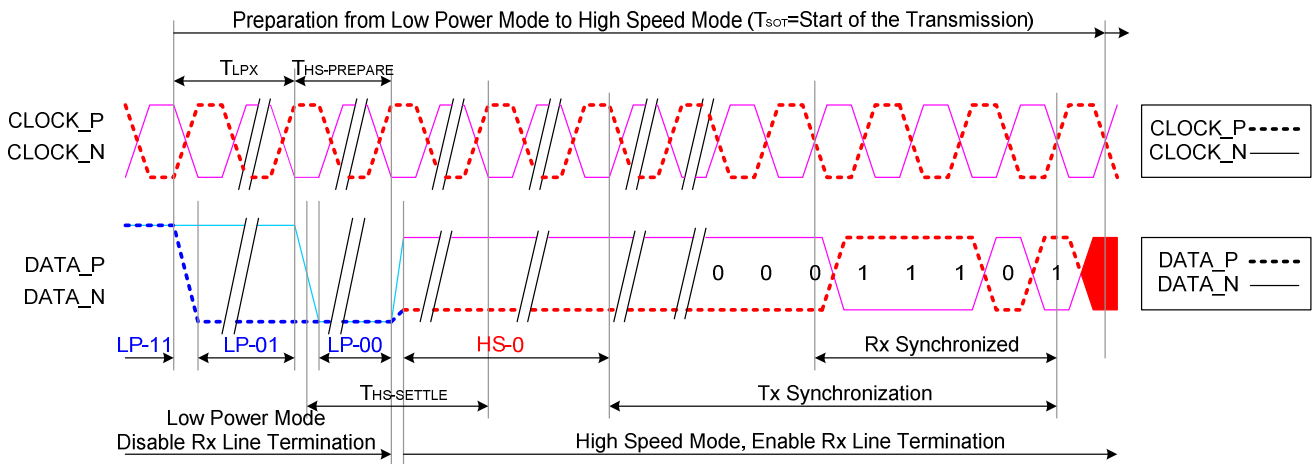

7.3.2.2.1. Entering High-Speed Data Transmission (T_{SOT} of HSDT)

ILI9486 is entering High-Speed Data Transmission (HSDT) when Clock lanes DSI-CLOCK_P/N have already been entered in the High-Speed Clock Mode (HSCM) by the MCU.

Data lanes DSI-DATA_P/N of ILI9486 are entering (T_{SOT}) in the High-Speed Data Transmission (HSDT) as follows

- Start: LP-11
- HS-Request: LP-01
- HS-Settle: LP-00 => HS-0 (Rx: Lane Termination Enable)
- Rx Synchronization: 011101 (Tx (= MCU) Synchronization: 0001 1101)
- End: High-Speed Data Transmission (HSDT) – Ready to receive High-Speed Data Load

This same entering High-Speed Data Transmission (T_{SOT} of HSDT) sequence is illustrated below:

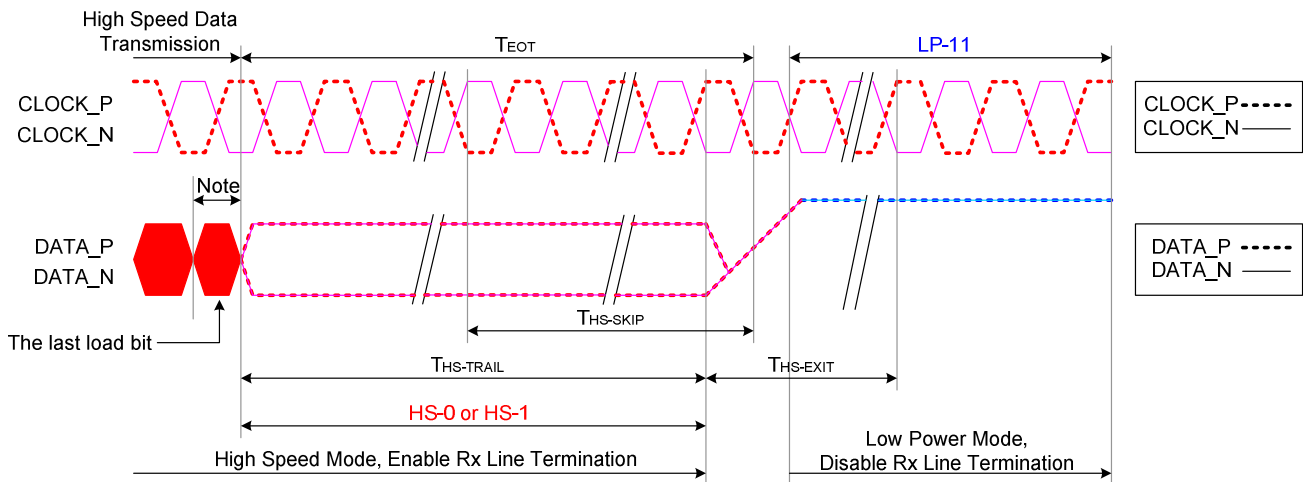

7.3.2.2.2. Leaving High-Speed Data Transmission (T_{EOT} of HSDT)

ILI9486 is leaving the High-Speed Data Transmission (T_{EOT} of HSDT) when Clock lanes DSI-CLOCK_P/N are in the High-Speed Clock Mode (HSCM) by the MCU and this HSCM is kept until data lanes DSI-DATA_P/N are in LP-11 mode.

Data lanes DSI-DATA_P/N of the display module are leaving from the High-Speed Data Transmission (T_{EOT} of HSDT) as follows

- Start: High-Speed Data Transmission (HSDT)
- Stops High-Speed Data Transmission
 - MCU changes to HS-1, if the last load bit is HS-0
 - MCU changes to HS-0, if the last load bit is HS-1
- End: LP-11 (Rx: Lane Termination Disable)

This same leaving High-Speed Data Transmission (T_{EOT} of HSDT) sequence is illustrated below

- Note: 1. If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.
2. If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.*

7.3.2.2.3. Burst of the High-Speed Data Transmission (HSDT)

The burst of the high-speed data transmission (HSDT) can consist of one data packet or several data packets. These data packets can be Long (LPa) or Short (SPa) packets. These packets are defined on chapter “7.3.3.1 Short Packet (SPa) and Long Packet (LPa) Structures“.

The single packet in High-Speed Data Transmission is illustrated for reference purposes below:

The multiple packets in High-Speed Data Transmission is illustrated for reference purposes below:

Abbreviation	Explanation
EOT	End of the Transmission
LPa	Long Packet
LP-11	Low Power Mode, Both of Data lanes are '1's (Stop Mode)
SPa	Short Packet
SOT	Start of the Transmission

7.3.2.3. Bus Turnaround (BTA)

The MCU or ILI9486, which is controlling DSI-DATA_P/N Data Lanes, can start a bus turnaround procedure when it wants information from a receiver, which can be the MCU or ILI9486. The MCU and ILI9486 are using the same sequence when this bus turnaround procedure is used. This sequence is described for reference purposes, when the MCU wants to do the bus turnaround procedure to ILI9486, as follows.

- Start (MCU): LP-11
- Turnaround Request (MCU): LP-11 =>LP-10 =>LP-00=>LP-10=>LP-00
- The MCU waits until ILI9486 is starting to control DSI-DATA_P/N data lanes and the MCU stops to control DSI-DATA_P/N data lanes (= High-Z)
- ILI9486 changes to the stop mode: LP-00 =>LP-10 =>LP-11

The same bus turnaround procedure (From the MCU to ILI9486) is illustrated below :

7.3.3. Packet Level Communication

7.3.3.1. Short Packet and Long Packet Structures

Short Packet (SPa) and Long Packet (LPa) are always used when data transmission is done in Low Power Data Transmission (LPDT) or High-Speed Data Transmission (HSDT) modes.

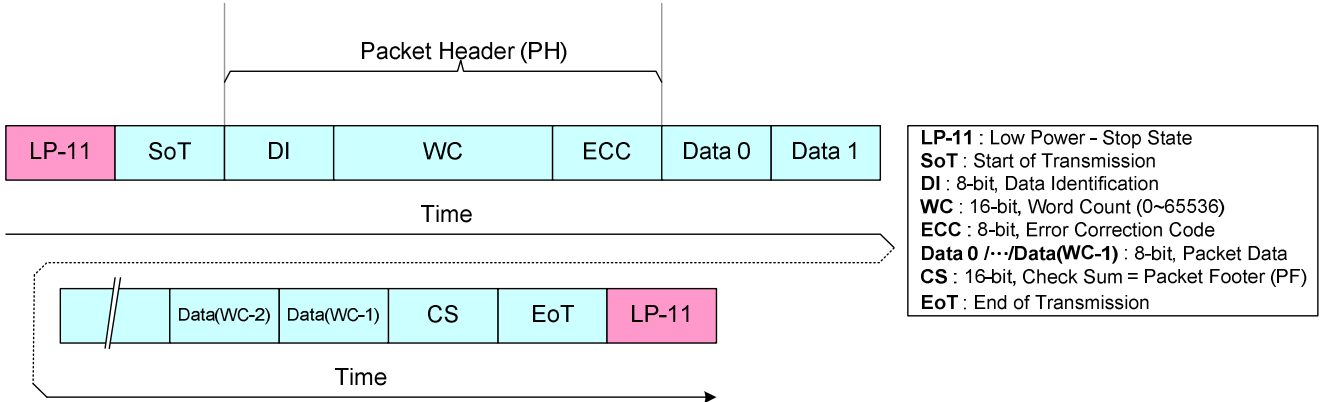

The lengths of the packets are

- Short Packet (SPa): 4 bytes
- Long Packet (LPa): From 6 to 65,541 bytes

The type (SPa or LPa) of the packet can be recognized from their package headers (PH). The Short Packet structure is illustrated as below:

The Long Packet structure is illustrated as below:

The other possibility is that there is not needed SoT, EoT and LP-11 between packets if packets have sent in multiple packet format e.g.

- LP-11 =>SoT =>SPa =>LPa =>SPa =>SPa =>EoT =>LP-11
- LP-11 =>SoT =>SPa =>SPa =>SPa =>EoT =>LP-11
- LP-11 =>SoT =>LPa =>LPa =>LPa =>EoT =>LP-11

7.3.3.1.1. Bit Order of the Byte on Packets

The bit order of the byte, what is used on packets, is that the Least Significant Bit (LSB) of the byte is sent in the first and the Most Significant Bit (MSB) of the byte is sent in the last.

This same order is illustrated for reference purposes below.

7.3.3.1.2. Byte Order of the Multiple Byte Information on Packets

Byte order of the multiple bytes information, what is used on packets, is that the Least Significant (LS) Byte of the information is sent in the first and the Most Significant (MS) Byte of the information is sent in the last e.g. Word Count (WC) consists of 2 bytes (16 bits) when the LS byte is sent in the first and the MS byte is sent in the last.

This same order is illustrated for reference purposes below.

7.3.3.1.3. Packet Header (PH)

The packet header is always consisting of 4 bytes. The content of these 4 bytes are different if it is used to Short Packet (SPa) or Long Packet (LPa).

Short Packet (SPa):

- 1st byte: Data Identification (DI) => Identification that this is Short Packet (SPa)
- 2nd and 3rd bytes: Packet Data (PD), Data 0 and 1
- 4th byte: Error Correction Code (ECC)

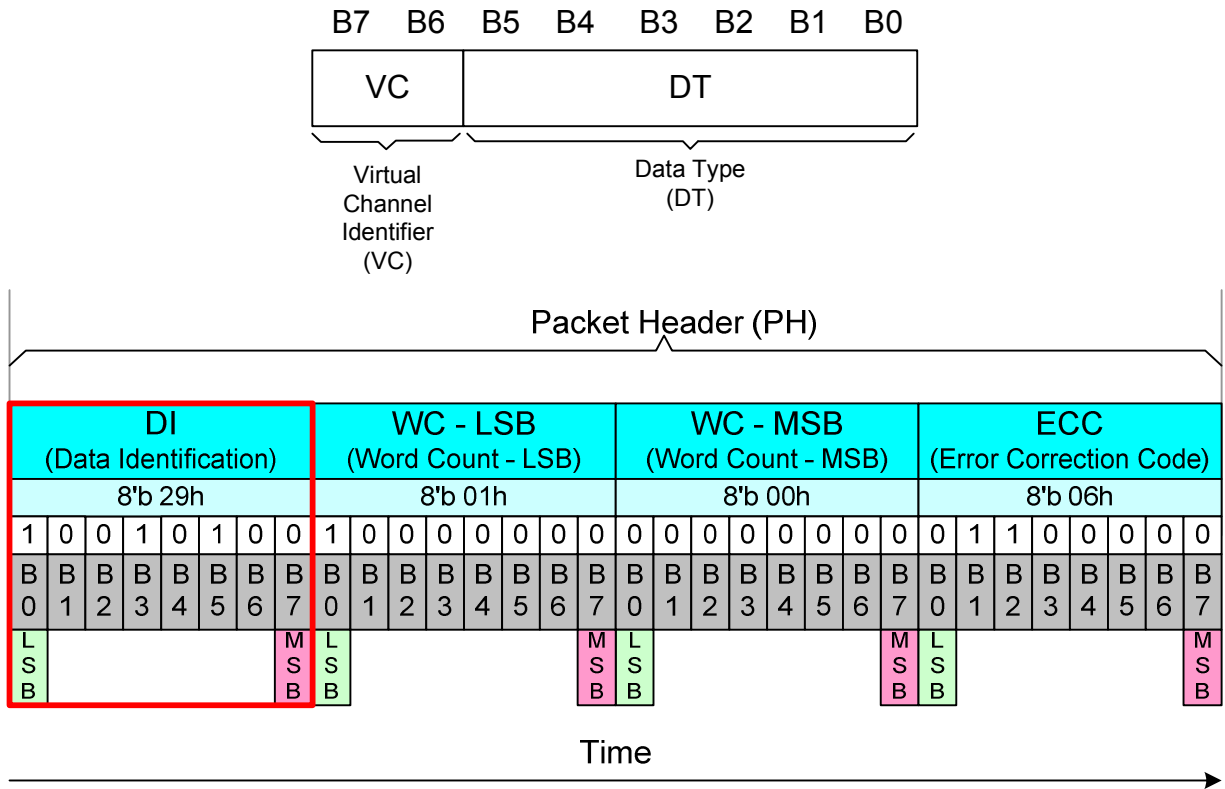

7.3.3.1.3.1. Data Identification (DI)

Data Identification (DI) is a part of Packet Header (PH) and it consists of 2 parts:

- Virtual Channel (VC), 2 bits, DI [7...6]
- Data Type (DT), 6 bits, DI [5...0]

The Data Identification (DI) structure is illustrated on a diagram below.

7.3.3.1.3.1.1. Virtual Channel (VC)

A processor may service up to four peripherals with tagged commands or blocks of data, using the Virtual Channel ID field of the header for packets targeted at different peripherals. The Virtual Channel ID enables one serial stream to service two or more virtual peripherals by multiplexing packets onto a common transmission channel. Note that packets sent in a single transmission each have their own Virtual Channel assignment and can be directed to different peripherals.

Virtual Channel (VC) is a part of Data Identification (DI [7...6]) structure and it is used to address where a packet is wanted to send from the MCU. Bits of the Virtual Channel (VC) are illustrated for reference purposes below.

Virtual Channel (VC) can address 4 different channels for e.g. 4 different display modules. Devices are using the same virtual channel what the MCU is using to send packets to them e.g.

- The MCU is using the virtual channel 0 when it sends packets to this display module
- This display module is also using the virtual channel 0 when it sends packets to the MCU

This functionality is illustrated below.

Virtual Channel (VC) is always 0 ($DI[7..6]=VC[1..0]=00b$) when the MCU is sending "End of Transmission Packet" to the display module.

7.3.3.1.3.1.2. Data Type (DT)

The Data Type field specifies if the packet is a Long or Short packet type and the packet format. The Data Type field, along with the Word Count field for Long packets, informs the receiver of how many bytes to expect in the remainder of the packet. This is necessary because there are no special packet start / end sync codes to indicate the beginning and end of a packet. This permits packets to convey arbitrary data, but it also requires the packet header to explicitly specify the size of the packet.

When the receiving logic has counted down to the end of a packet, it shall assume the next data is either the header of a new packet or the EoT (End of Transmission) sequence.

Data Type (DT) is a part of Data Identification (DI [5...0]) structure and it is used to define a type of the used data on a packet. Bits of the Data Type (DT) are illustrated for reference purposes below.

This Data Type (DT) also defines what the used packet is: Short Packet (SPa) or Long Packet (LPa). Data Types (DT) are different from the MCU to the display module (or other devices) and vice versa. These Data Type (DT) are defined on tables below

From the MCU to ILI9486									
Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Hex	Description	Short/Long Packet	Abbreviation
0	0	1	0	0	0	08	End of Transmission Packet, Note1	SPa (Short Packet)	EoTP
0	0	0	1	0	1	05	DCS Write, No Parameter	SPa (Short Packet)	DCSWN-S
0	1	0	1	0	1	15	DCS Write, 1 Parameter	SPa (Short Packet)	DCSW1-S
0	0	0	1	1	0	06	DCS Read, No Parameter	SPa (Short Packet)	DCSRN-S
1	1	0	1	1	1	37	Set Maximum Return Packet Size	SPa (Short Packet)	SMRPS-S
0	0	1	0	0	1	09	Null Packet, No Data, Note2	LPa (Long Packet)	NP-L
1	1	1	0	0	1	39	DCS Write Long	LPa (Long Packet)	DCSW-L

- Notes:
1. This can be used when the MCU wants to secure that there is the end of the transmission in High Speed Data Transferring (HSDT) mode.
 2. This can be used when data lanes are wanted to keep in High Speed Data Transferring (HSDT) Mode.
 3. The receiver is ignored other Data Type (DT) if they are not defined on tables.

From ILI9486 to the MCU									
Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Hex	Description	Short/Long Packet	Abbreviation
0	0	0	0	1	0	02	Acknowledge with Error Report	SPa (Short Packet)	AwER
0	1	1	1	0	0	1C	DCS Read Long Response	LPa (Long Packet)	DCSRR-L
1	0	0	0	0	1	21	DCS Read Short Response, 1 byte returned	SPa (Short Packet)	DCSRR1-S
1	0	0	0	1	0	22	DCS Read Short Response, 2 byte returned	SPa (Short Packet)	DCSRR2-S

Notes: 1. The receiver is ignored other Data Type (DT) if they are not defined on tables.

7.3.3.1.3.2. Packet Data on the Short Packet

Packet Data (PD) of the Short Packet (SPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Short Packet (SPa) is wanted to send. Packet Data (PD) of the Short Packet (SPa) consists of 2 data bytes: Data 0 and Data 1. Packet Data (PD) sending order is that Data 0 is sent in the first and the Data 1 is sent in the last. Bits of Data 1 are set to '0' if the information length is 1 byte.

Packet Data (PD) of the Short Packet (SPa), when the length of the information is 1 or 2 bytes are illustrated for reference purposes below, when Virtual Channel (VC) is 0.

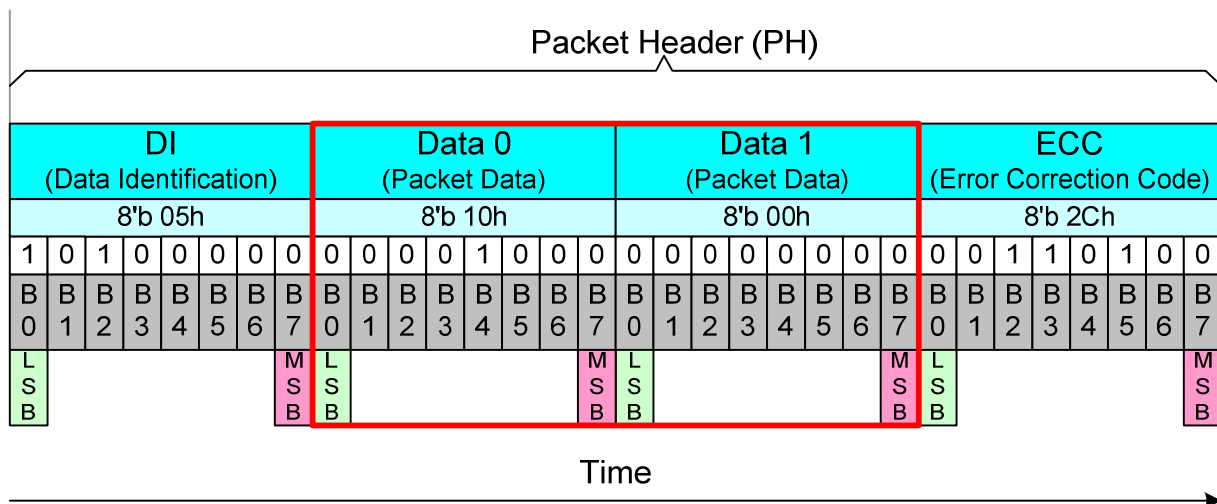

Packet Data (PD) information:

- Data 0: 35hex (Display Command Set (DCS) with 1 Parameter => DI (Data Type (DT)) = 15hex)
- Data 1: 01hex (DCS's parameter)

Packet Data (PD) information:

- Data 0: 10hex (DCS without parameter => DI (Data Type (DT)) = 05hex)
- Data 1: 00hex (Null)

7.3.3.1.3.3. Word Count on the Long Packet

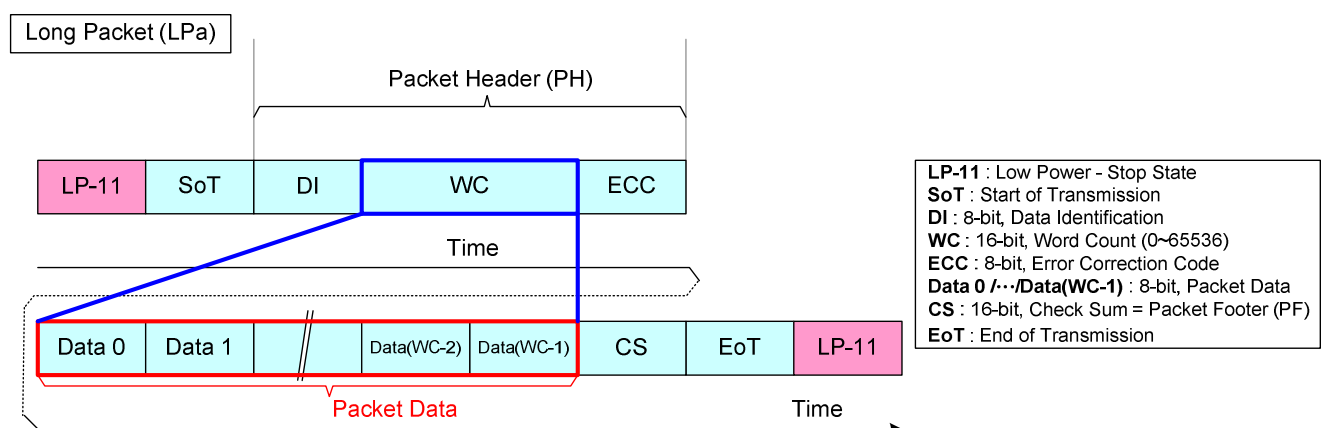

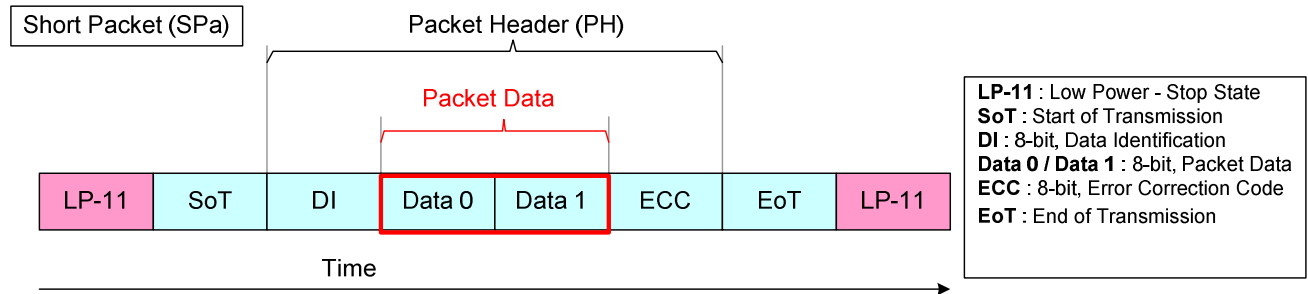

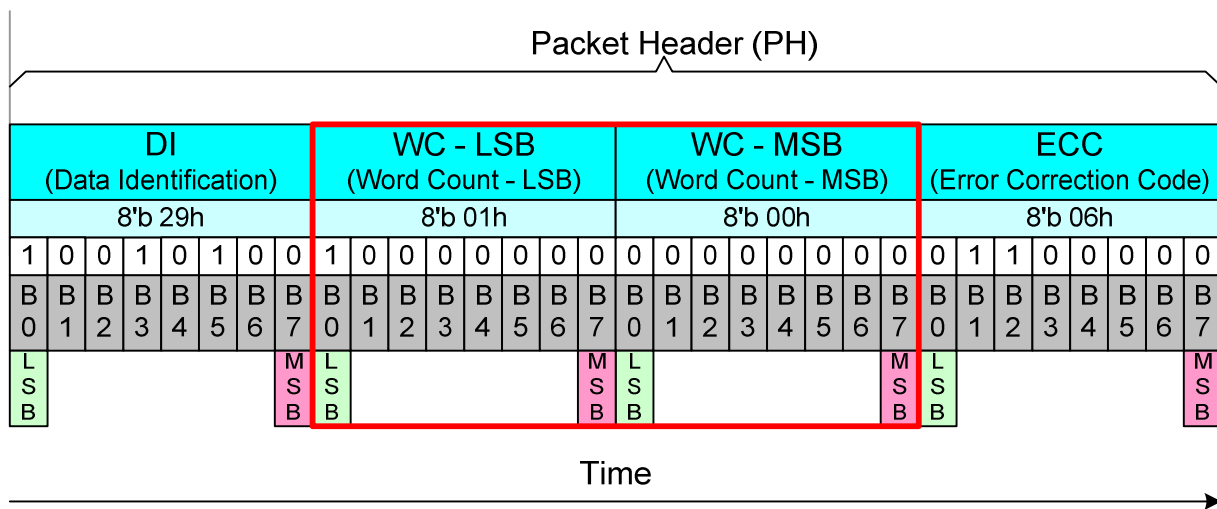

Word Count (WC) of the Long Packet (LPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Long Packet (LPa) is wanted to send.

Word Count (WC) indicates a number of the data bytes of the Packet Data (PD) what is wanted to send after Packet Header (PH) versus Packet Data (PD) of the Short Packet (SPa) are placed in the Packet Header (PH).

Word Count (WC) of the Long Packet (LPa) consists of 2 bytes.

These 2 bytes of the Word Count (WC) sending order is that the Least Significant (LS) Byte is sent in the first and the Most Significant (MS) Byte is sent in the last.

Word Count (WC) of the Long Packet (LPa) is illustrated for reference purposes below.

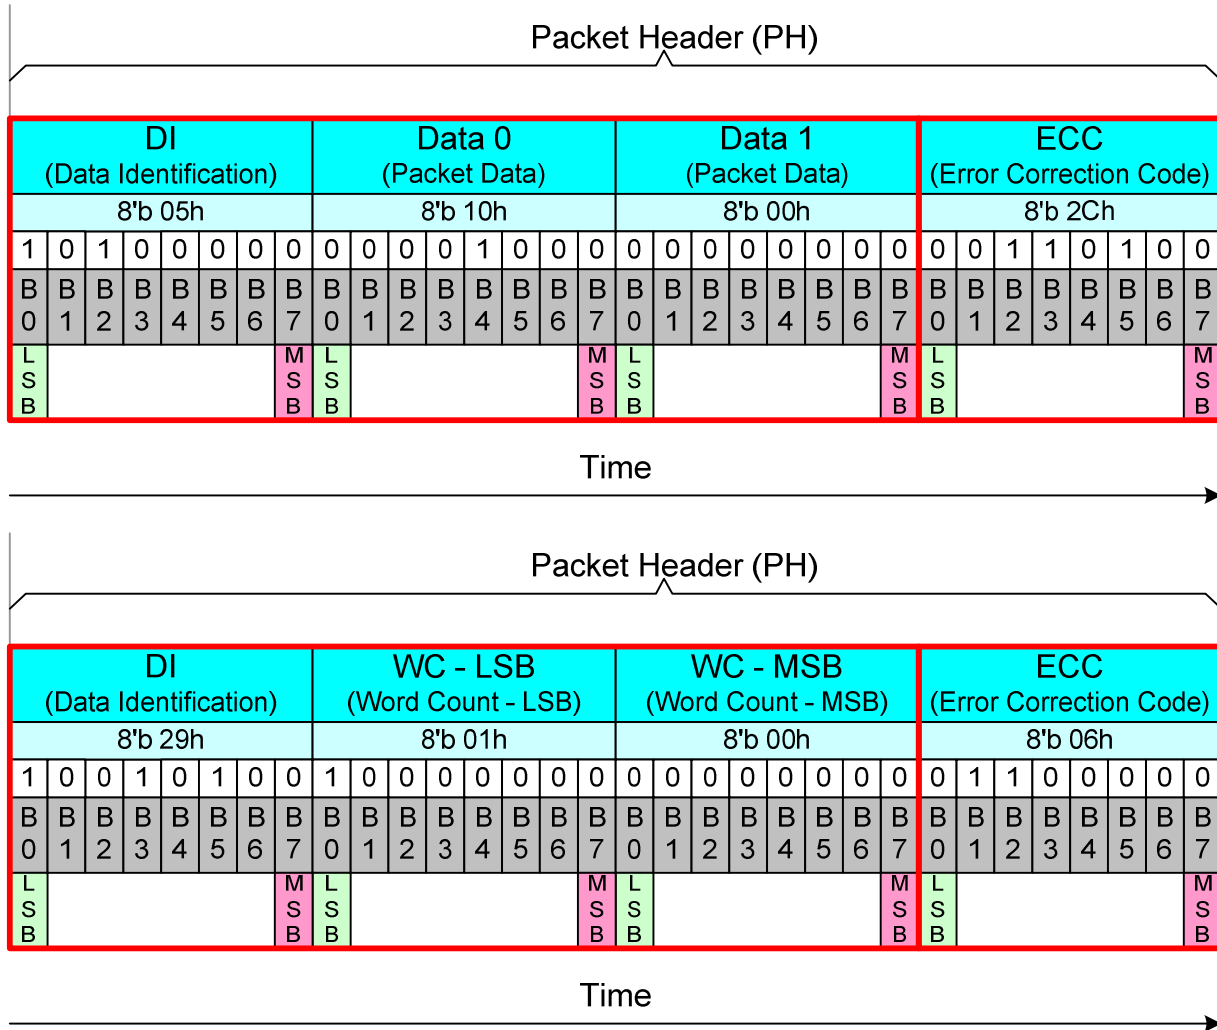

7.3.3.1.3.4. Error Correction Code (ECC)

The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header. The host processor shall always calculate and transmit an ECC byte and ILI9486 supports ECC in both forward- and reverse-direction communications.

Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors:

- Short Packet (SPa): Data Identification (DI) and Packet Data (PD) bytes (24 bits: D [23...0])
- Long Packet (LPa): Data Identification (DI) and Word Count (WC) bytes (24 bits: D [23...0])

D [23...0] is illustrated for reference purposes below.

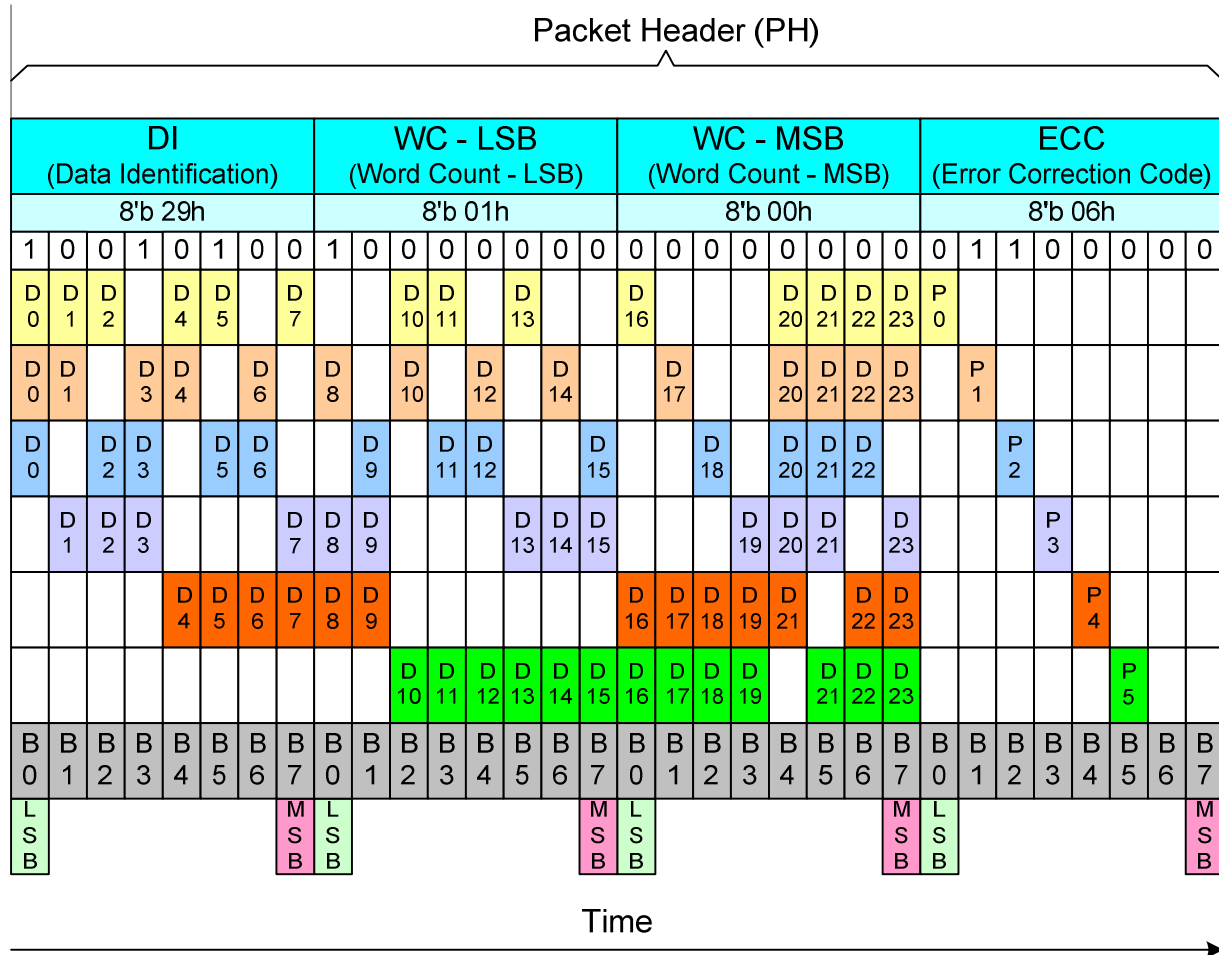

Error Correction Code (ECC) can recognize one error or several errors and makes correction in one bit error case.

Bits (P[7...0]) of the Error Correction Code (ECC) are defined, where the symbol '^' is presenting XOR function (Pn is '1' if there is odd number of '1's and Pn is '0' if there is even number of '1's), as follows.

- P7 = 0
- P6 = 0
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23

- $P2 = D0 \wedge D2 \wedge D3 \wedge D5 \wedge D6 \wedge D9 \wedge D11 \wedge D12 \wedge D15 \wedge D18 \wedge D20 \wedge D21 \wedge D22$
- $P1 = D0 \wedge D1 \wedge D3 \wedge D4 \wedge D6 \wedge D8 \wedge D10 \wedge D12 \wedge D14 \wedge D17 \wedge D20 \wedge D21 \wedge D22 \wedge D23$
- $P0 = D0 \wedge D1 \wedge D2 \wedge D4 \wedge D5 \wedge D7 \wedge D10 \wedge D11 \wedge D13 \wedge D16 \wedge D20 \wedge D21 \wedge D22 \wedge D23$

P7 and P6 are set to '0' because Error Correction Code (ECC) is based on 64 bit value ([D63...0]), but this implementation is based on 24 bit value (D [23...0]). Therefore, there is only needed 6 bits (P [5...0]) for Error Correction Code (ECC).

The transmitter (The MCU or ILI9486) is sending data bits D [23...0] and Error Correction Code (ECC) P [7...0]. The receiver (ILI9486 or the MCU) is calculate an Internal Error Correction Code (IECC) and compares the received Error Correction Code (ECC) and the Internal Error Correction Code (IECC). This comparison is done when each power bit of ECC and IECC have been done XOR function. The result of this function is PO [7...0]. This functionality, where the transmitter is the MCU and the receiver is ILI9486, is illustrated for reference purposes below.

The sent data bits (D[23...0]) and ECC (P[7...0]) are received correctly, if a value of the PO[7...0] is 00h.

The sent data bits (D[23...0]) and ECC (P[7...0]) are not received correctly, if a value of the PO[7...0] is not 00h.

ECC P[7:0]	1	1	0	0	0	0	0	0	03h
IECC PI[7:0]	1	1	0	0	0	0	0	0	03h
$(ECC) \oplus (IECC) \rightarrow PO[7:0]$	0	0	0	0	0	0	0	0	=00h \rightarrow No Error
	L							M	
	S							S	
	B							B	
ECC P[7:0]	1	1	0	0	0	0	0	0	03h
IECC PI[7:0]	1	1	1	1	0	0	0	0	0Fh
$(ECC) \oplus (IECC) \rightarrow PO[7:0]$	0	0	1	1	0	0	0	0	=0Ch \rightarrow Error
	L							M	
	S							S	
	B							B	

The received Error Correction Code (ECC) can be 00h when the Error Correction Code (ECC) functionality is not used for data values D[23...0] on the transmitter side.

The number of the errors (one or more) can be defined when the value of the PO [7...0] is compared to values on the following table.

Data Bit	PO7	PO6	PO5	PO4	PO3	PO2	PO1	PO0	Hex
D[0]	0	0	0	0	0	1	1	1	07h
D[1]	0	0	0	0	1	0	1	1	0Bh
D[2]	0	0	0	0	1	1	0	1	0Dh
D[3]	0	0	0	0	1	1	1	0	0Eh
D[4]	0	0	0	1	0	0	1	1	13h
D[5]	0	0	0	1	0	1	0	1	15h
D[6]	0	0	0	1	0	1	1	0	16h
D[7]	0	0	0	1	1	0	0	1	19h
D[8]	0	0	0	1	1	0	1	0	1Ah
D[9]	0	0	0	1	1	1	0	0	1Ch
D[10]	0	0	1	0	0	0	1	1	23h
D[11]	0	0	1	0	0	1	0	1	25h
D[12]	0	0	1	0	0	1	1	0	26h
D[13]	0	0	1	0	1	0	0	1	29h
D[14]	0	0	1	0	1	0	1	0	2Ah
D[15]	0	0	1	0	1	1	0	0	2Ch
D[16]	0	0	1	1	0	0	0	1	31h
D[17]	0	0	1	1	0	0	1	0	32h
D[18]	0	0	1	1	0	1	0	0	34h
D[19]	0	0	1	1	1	0	0	0	38h
D[20]	0	0	0	1	1	1	1	1	1Fh
D[21]	0	0	1	0	1	1	1	1	2Fh
D[22]	0	0	1	1	0	1	1	1	37h
D[23]	0	0	1	1	1	0	1	1	3Bh

One error is detected if the value of the PO [7...0] is on the above table : One Bit Error Value of the Error Correction Code (ECC) and the receiver can correct this one bit error because this found value also defines what is a location of the corrupt bit e.g.

- PO [7...0] = 0Eh
- The bit of the data (D [23...0]), what is not correct, is D[3]

More than one error is detected if the value of the PO [7...0] is not on the above table: One Bit Error Value of the Error Correction Code (ECC) e.g. PO [7...0] = 0Ch.

7.3.3.1.4. Packet Data on the Long Packet

Packet Data (PD) of the Long Packet (LPa) is defined after Packet Header (PH) of the Long Packet (LPa). The number of the data bytes is illustrated as below:

7.3.3.1.5. Packet Footer on the Long Packet

Packet Footer (PF) of the Long Packet (LPa) is defined after the Packet Data (PD) of the Long Packet (LPa). The Packet Footer (PF) is a checksum value what is calculated from the Packet Data of the Long Packet (LPa). The checksum is using a 16-bit Cyclic Redundancy Check (CRC) value which is generated with a polynomial $X_{16}+X_{12}+X_5+X_0$ as it is illustrated below.

The 16-bit Cyclic Redundancy Check (CRC) generator is initialized to FFFFh before calculations.

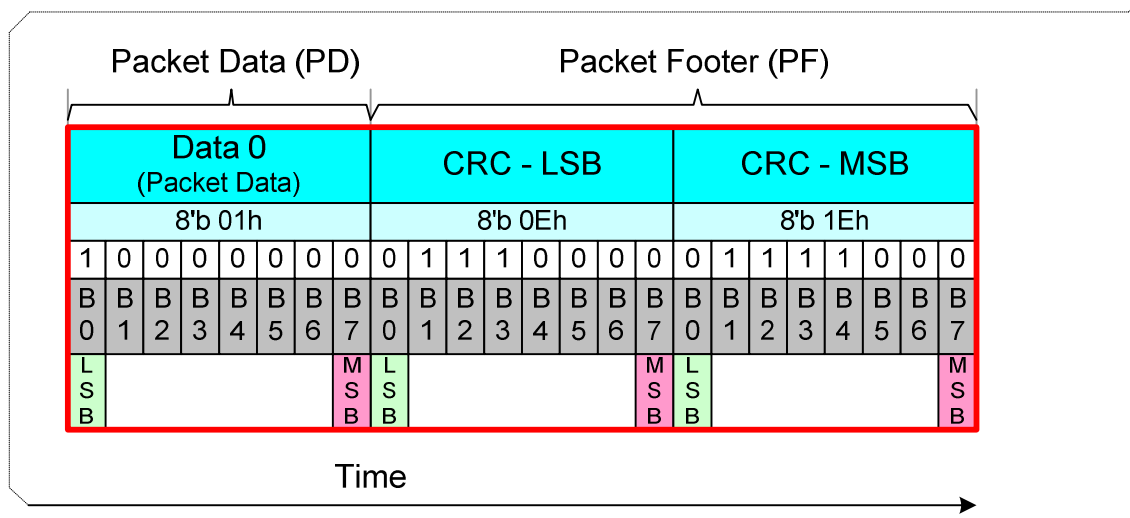

The Most Significant Bit (MSB) of the data byte of the Packet Data (PD) is the first bit what is inputted into the 16-bit Cyclic Redundancy Check (CRC).

An example of the 16-bit Cyclic Redundancy Check (CRC), where the Packet Data (PD) of the Long Packet (LPa) is 01h, is illustrated (step-by-step) below.

Step	In	XOR(In,C0)	C15	C14	C13	C12	C11	XOR(XOR(In,C0),C11(Step-1))	C10	C9	C8	C7	C6	C5	C4	XOR(XOR(In,C0),C4(Step-1))	C3	C2	C1	C0	C0	
0	X	X	1	1	1	1	1	X	1	1	1	1	1	1	1	X	1	1	1	1	X	
1	1(LSB)	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
2	0	1	1	0	1	1	1	0	0	1	1	1	1	1	1	0	0	1	1	1	1	
3	0	1	1	1	0	1	1	0	0	0	1	1	1	1	1	0	0	0	1	1	1	
4	0	1	1	1	1	0	1	0	0	0	0	1	1	1	1	0	0	0	0	1	1	
5	0	1	1	1	1	1	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	
6	0	0	0	1	1	1	1	0	0	0	0	0	0	1	1	1	1	0	0	0	0	
7	0	0	0	0	1	1	1	1	1	0	0	0	0	0	1	1	1	1	0	0	0	
8	0(MSB)	0	0	0	0	1	1	1	1	1	0	0	0	0	0	1	1	1	1	0	0	
	1 byte	CRC result	0	0	0	1	1		1	1	0	0	0	0	0		1	1	1	0		
			MSB																			LSB

A value of the Packet Footer (PF) is 1E0Eh in this example. This example (Command 01h has been sent) is illustrated below.

The receiver is calculated own checksum value from received Packet Data (PD). The receiver compares own checksum and the Packet Footer (PF) what the transmitter has sent.

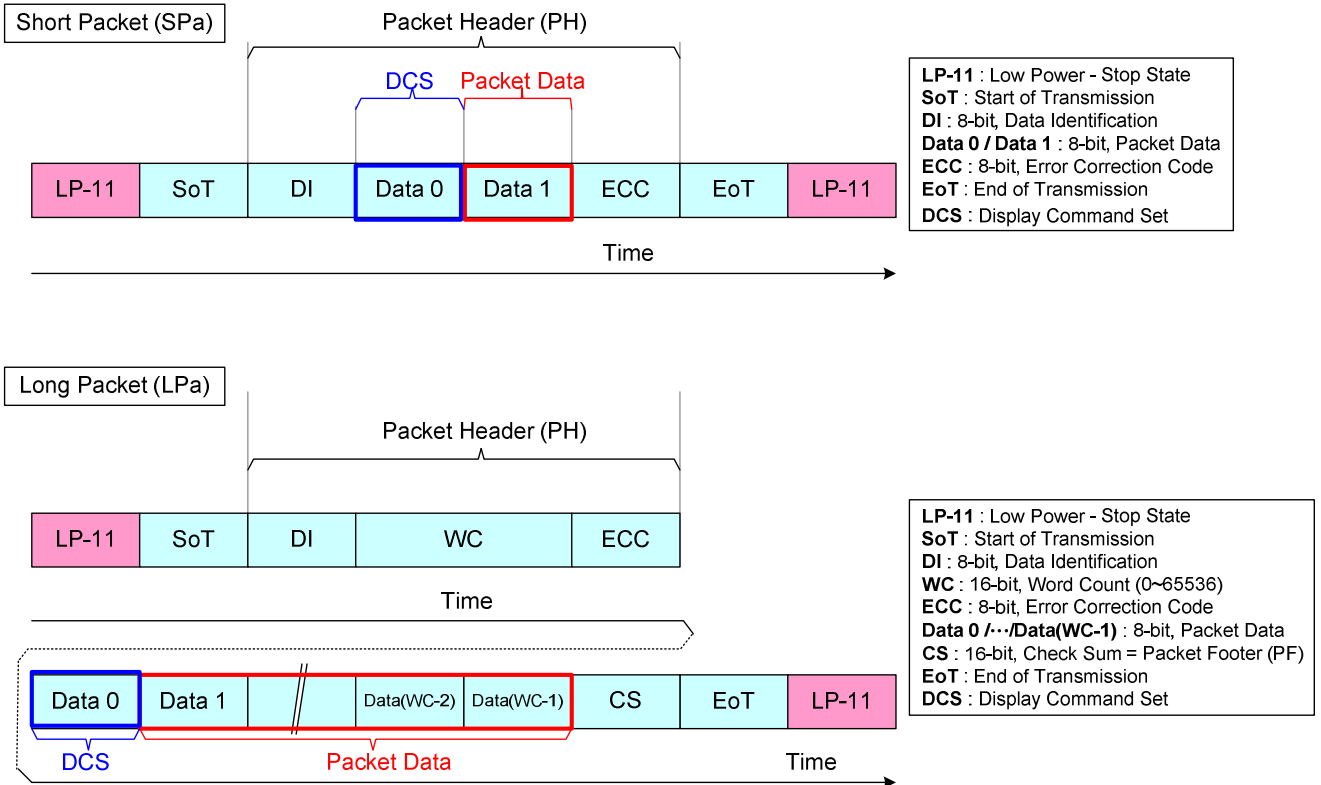

The received Packet Data (PD) and Packet Footer (PF) are correct if the own checksum of the receiver and Packet Footer (PF) is equal and vice versa the received Packet Data (PD) and Packet Footer (PF) are not correct if the own checksum of the receiver and Packet Footer (PF) are not equal.

7.3.3.2. Packet Transmissions

7.3.3.2.1. Packet form the MCU to ILI9486

7.3.3.2.1.1. Display Command Set (DCS)

Display Command Set (DCS), which is defined on next chapter, is used from the MCU to ILI9486. This Display Command Set (DCS) is always defined on the Data 0 of the Packet Data (PD), which is included in Short Packet (SPa) and Long packet (LPa) as these are illustrated as below.

7.3.3.2.1.2. Display Command Set Write, no Parameter (DCSWN-S)

“Display Command Set (DCS) Write, No Parameter” is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0101b), from the MCU to ILI9486. These commands are defined on a table below.

Command
NOP (00h)
Software Reset (01h)
Sleep IN(10h)
Sleep Out (11h)
Partial Mode ON (12h)
Normal Display Mode ON (13h)
Display OFF (28h)
Display ON (29h)
Tearing Effect Line OFF (34h)
Idle Mode OFF (38h)
Idle Mode ON (39h)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 00 0101b
- Packet Data (PD)
 - Data 0: “Sleep In (10h)”, Display Command Set (DCS)
 - Data 1: Always 00hex
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

7.3.3.2.1.3. Display Command Set Write, 1 Parameter (DCSW1-S)

“Display Command Set (DCS) Write, 1 Parameter” (DCSW1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0101b), from the MCU to ILI9486. These commands are defined on a table below.

Command
Gamma Set
Memory Write (2Ch), Note
Tearing Effect Line ON (35h)
Memory Access Control (36h)
Interface Pixel Format (3Ah)
Memory Write Continue (3Ch), Note
Write Display Brightness (51h)
Write CTRL Display (53h)
Write Content Adaptive Brightness control (55h)
Write CABC Minimum Brightness (5Eh)

Note: One Subpixel has been written

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 0101b
- Packet Data (PD)
 - Data 0: “Gamma Set (26h)”, Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

7.3.3.2.1.4. Display Command Set Write Long (DCSW-L)

“Display Command Set (DCS) Write Long” (DCSW-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 11 1001b), from the MCU to ILI9486. Command (No Parameters) and Write (1 or more parameters) are defined on a table below.

Command
NOP (00h) , Note 1
Software Reset (01h) , Note 1
Sleep IN(10h) , Note 1
Sleep Out (11h) , Note 1
Partial Mode ON (12h) , Note 1
Normal Display Mode ON (13h) , Note 1
Gamma Set (26h), Note 2
Display OFF (28h) , Note 1
Display ON (29h) , Note 1
Column Address Set (2Ah)
Page Address Set (2Bh)
Memory Write (2Ch), Note 2
Partial Area (30h)
Tearing Effect Line OFF (34h), Note 1
Tearing Effect Line ON (35h), Note 2
Memory Access Control (36h), Note 2
Idle Mode OFF (38h) , Note 1
Idle Mode ON (39h) , Note 1
Interface Pixel Format(3Ah)
Memory Write Continue (3Ch), Note 2
Write Display Brightness (51h) , Note 2
Write CTRL Display (53h) , Note 2
Write Content Adaptive Brightness control (55h) , Note 2
Write CABC Minimum Brightness (5Eh)

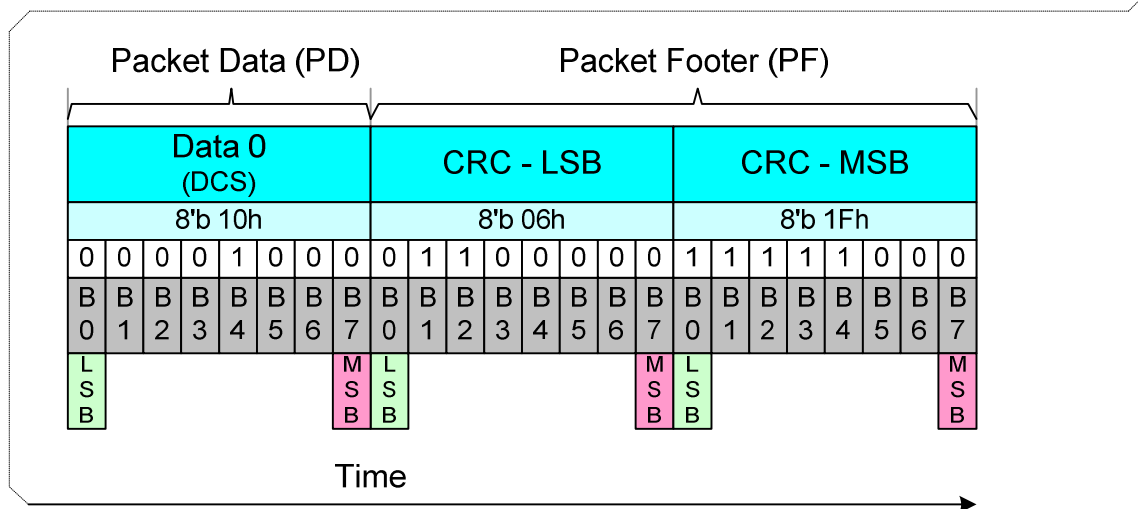

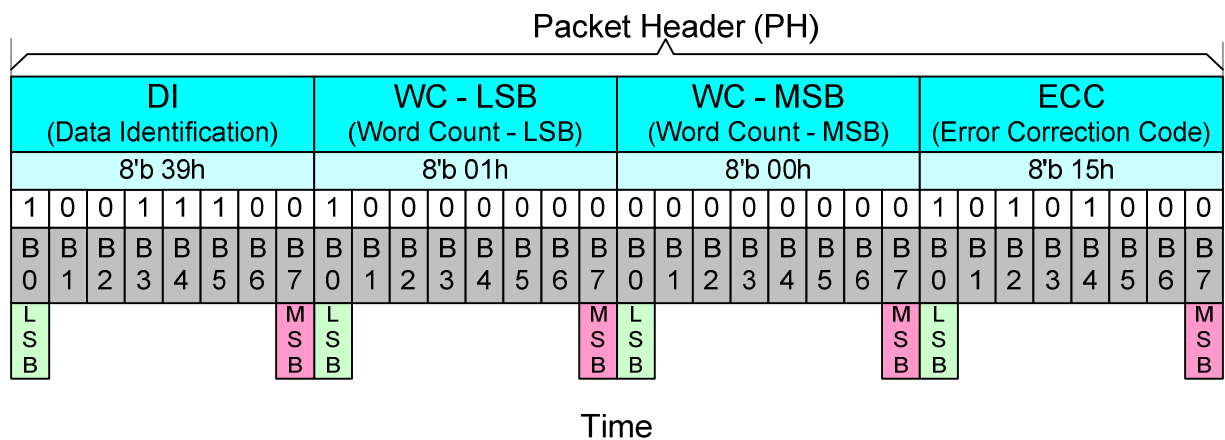

Notes: (1) Also Short Packet (SPa) can be used; See chapter “7.3.3.2.1.1.1 Display Command Set (DCS) Write, No Parameter”

(2) Also Short Packet (SPa) can be used; See chapter “7.3.3.2.1.1.2 Display Command Set (DCS) Write, 1 Parameter”

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 11 1001b
- Word Count (WC)
 - Word Count (WC): 0001h
- Error Correction Code (ECC)
- Packet Data (PD): Data 0: "Sleep In (10h)", Display Command Set (DCS)
- Packet Footer (PF)

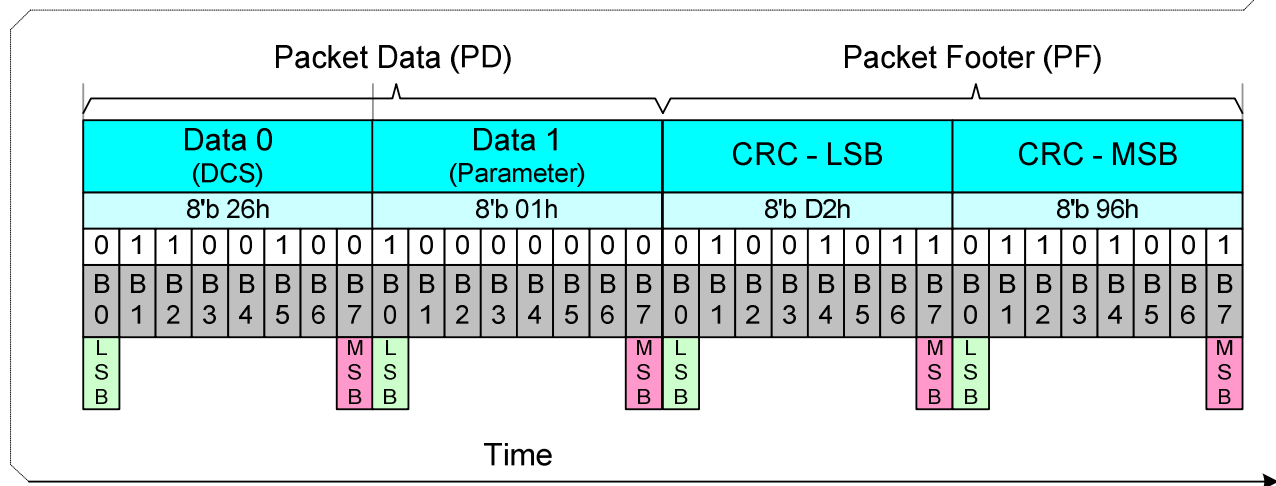

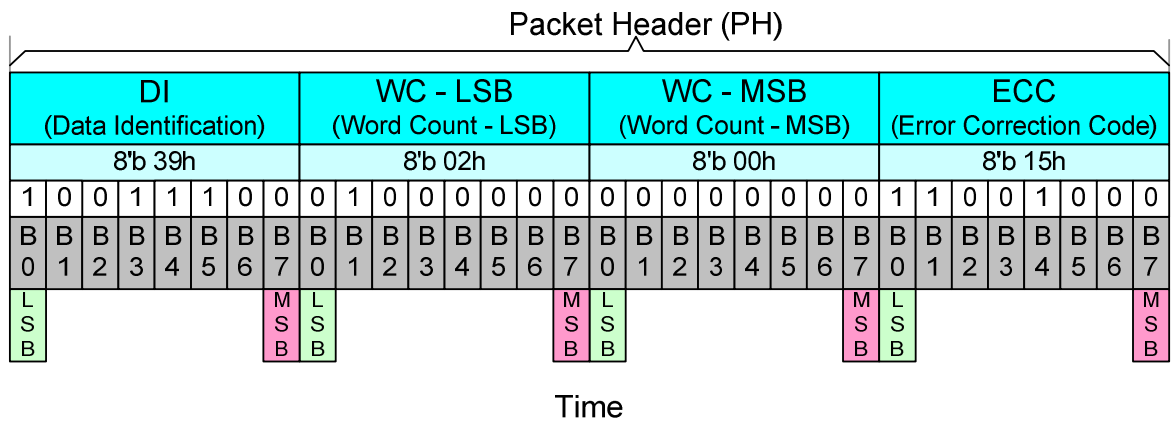

This is defined on the Long Packet (LPa) as follows.

Long Packet (LPa), when a Write (1 parameter) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 11 1001b
- Word Count (WC)
 - Word Count (WC): 0002h
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: "Gamma Set (26h)", Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows

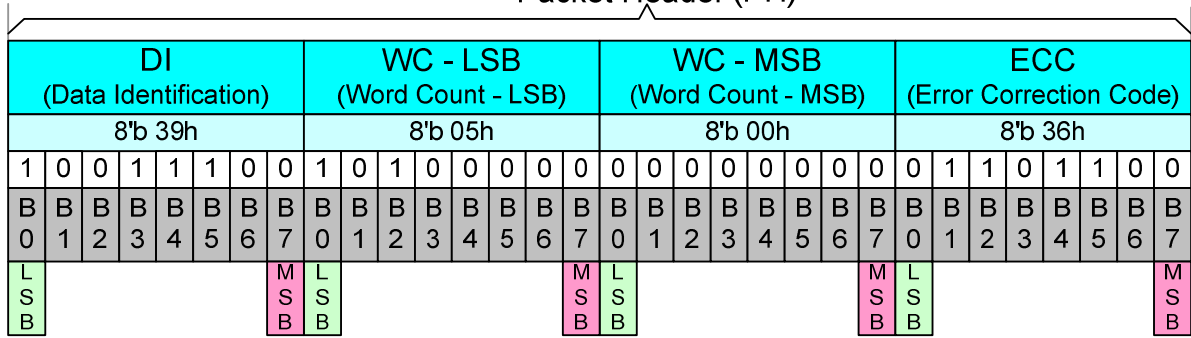

Long Packet (LPa), when a Write (4 parameters) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 11 1001b
- Word Count (WC)
 - Word Count (WC): 0005h
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: "Column Address Set (2Ah)", Display Command Set (DCS)
 - Data 1: 00hex, 1st Parameter of the DCS, Start Column SC [15...8]
 - Data 2: 12hex, 2nd Parameter of the DCS, Start Column SC [7...0]
 - Data 3: 01hex, 3rd Parameter of the DCS, End Column EC [15...8]
 - Data 4: EFhex, 4th Parameter of the DCS, End Column EC [7...0]
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

Packet Header (PH)

Time

Packet Data (PD)

Time

Packet Data (PD)

Packet Footer (PF)

Time

7.3.3.2.1.5. Display Command Set Read, No Parameter (DCSRN-S)

“Display Command Set (DCS) Read, No Parameter” (DCSRN-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0110b), from the MCU to ILI9486. These commands are defined on a table below. The 1st parameter (Dummy Data) is not returned as it is done in MCU parallel interface. The first returned parameter is the 2nd parameter in DSI case.

Command
Read Number of the Errors on DSI (05h)
Read Display Power Mode (0Ah)
Read Display MADCTL (0Bh)
Read Display Pixel Format (0Ch)
Read Display Image Mode (0Dh)
Read Display Signal Mode (0Eh)
Read Display Self-Diagnostic Result (0Fh)
Memory Read (2Eh)
Memory Read Continue (3Eh)
Read Display Brightness Value (52h)
Read CTRL Value Display (54h)
Read Black/White Low Bits (70h)
Read Bkx (71h)
Read Bky(72h)
Read Wx (73h)
Read Wy (74h)
Read Red/Green Low Bits (75h)
Read Rx (76h)
Read Ry (77h)
Read Gx (78h)
Read Gy (79h)
Read Blue/A Color Low Bits (7Ah)

Read By (7Ch)
Read Ax (7Dh)
Read Ay (7Eh)
Read DDB Start (A1h)
Read DDB Continue (A8h)
First Checksum (AAh)
Read Continue Checksum (Afh)
Read ID1 (DAh)
Read ID2 (DBh)
Read ID3 (DCh)

The MCU has to define to ILI9486, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size” (SMRPS-S), which Data Type (DT) is 11 0111b and which is using Short Packet (SPa) before the MCU can send “Display Command Set (DCS) Read, No Parameter” to ILI9486. This same sequence is illustrated for reference purposes below.

Step 1:

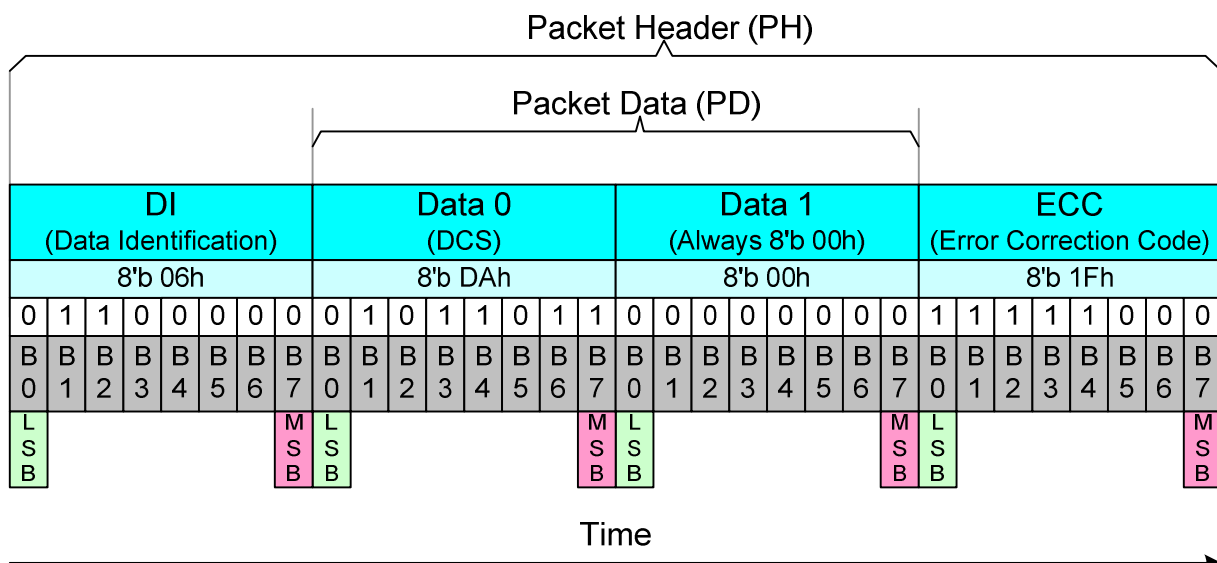

- The MCU sends “Set Maximum Return Packet Size” (Short Packet (SPa)) (SMRPS-S) to ILI9486 when it wants to return one byte from ILI9486
- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 11 0111b
- Maximum Return Packet Size (MRPS)

- Data 0: 01hex
- Data 1: 00hex
- Error Correction Code (ECC)

Step 2:

- The MCU wants to receive a value of the “Read ID1 (DAh)” from the display module when the MCU sends “Display Command Set (DCS) Read, No Parameter” to ILI9486
- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 00 0110b
- Packet Data (PD)
 - Data 0: “Read ID1 (DAh)”, Display Command Set (DCS)
 - Data 1: Always 00hex
- Error Correction Code (ECC)

Step 3: ILI9486 can send 2 different informations to the MCU after Bus Turnaround (BTA)

1. An acknowledge with Error Report (AwER), which is using a Short Packet (SPa), if there is an error to receive a command.
2. Information of the received command. Short Packet (SPa) or Long Packet (LPa)

7.3.3.2.1.6. Null Packet, No Data (NP-L)

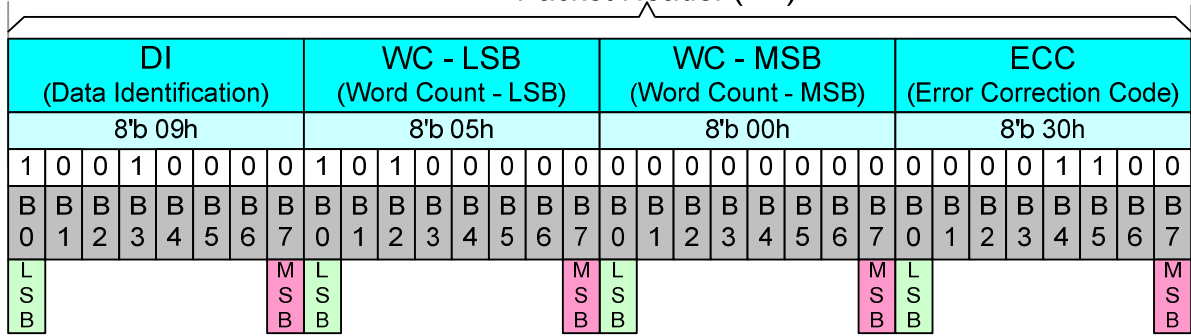

“Null Packet, No Data” (NP-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 00 1001b), from the MCU to ILI9486. The purpose of this command is keeping data lanes in the high speed mode (HSDT), if it is needed. ILI9486 is ignored Packet Data (PD) what the MCU is sending.

Long Packet (LPa), when 5 random data bytes of the Packet Data (PD) were sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 00 1001b
- Word Count (WC)
 - Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: 89hex (Random data)
 - Data 1: 23hex (Random data)
 - Data 2: 12hex (Random data)
 - Data 3: A2hex (Random data)
 - Data 4: E2hex (Random data)
- Packet Footer (PF)

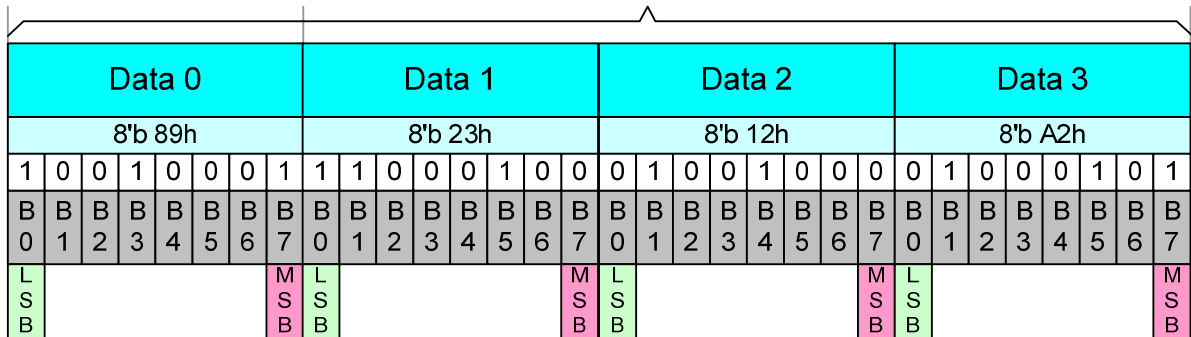

This is defined on the Long Packet (LPa) as follows.

Packet Header (PH)

Time

Packet Data (PD)

Time

Packet Data (PD)

Packet Footer (PF)

Time

7.3.3.2.1.7. End of Transmission Packet (EoTP)

“End of Transmission Packet” (EoTP) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 1000b), from the MCU to ILI9486. The purposes of this command is terminated the high Speed Data Transmission (HSDT) mode properly when there is added this extra packet after the last payload packet before “End of Transmission” (EoT), which is an interface level functionality.

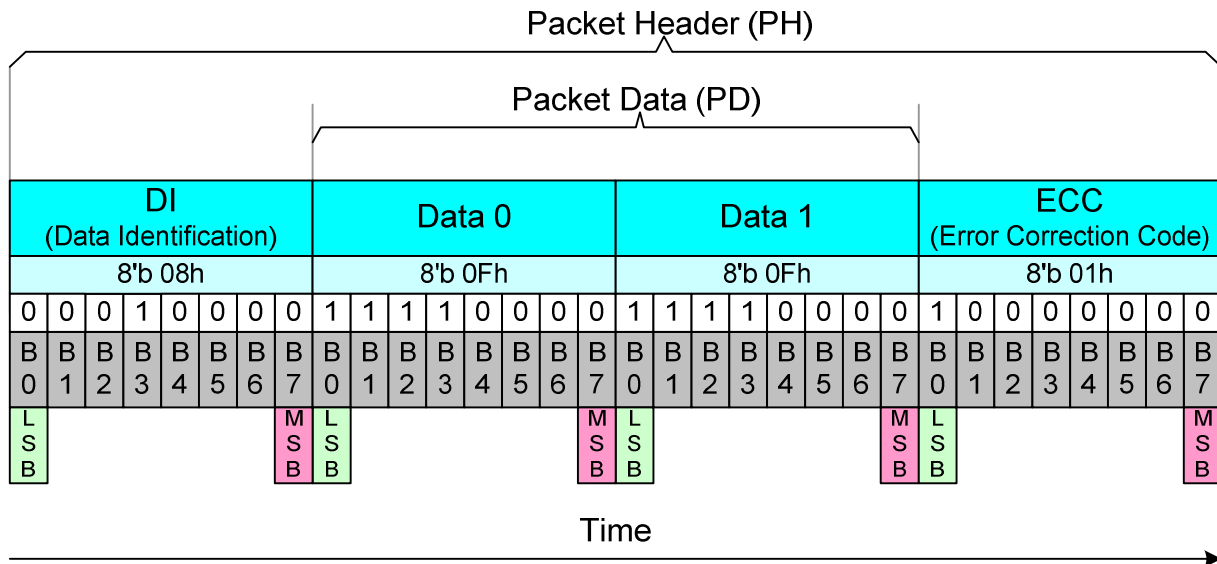

“End of Transmission Packet” (EoTP) should also be supported in the Low Power Data Transmission (LPDT) mode on ILI9486e even if this functionality has not been designed for this purposes.

The MCU can decide if it wants to use these “End of Transmission Packet” (EoTP) or not but ILI9486 has to be supporting both modes: With or Without “End of Transmission Packet” (EoTP).

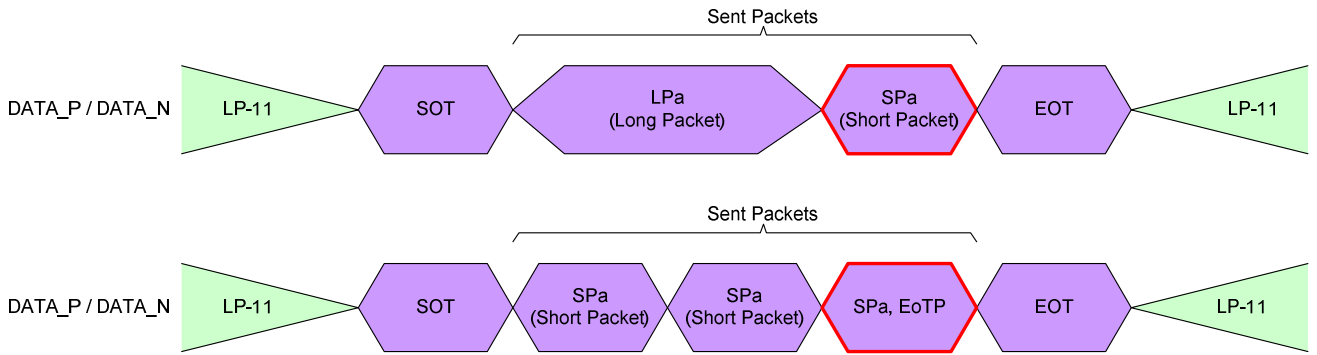

Short Packet (SPa) is using a fixed format as follows

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 00 1000b
- Packet Data (PD)
 - Data 0: 0Fhex
 - Data 1: 0Fhex
- Error Correction Code (ECC)
 - ECC: 01hex

This is defined on the Short Packet (SPa) as follows.

Some use cases of the “End of Transmission Packet” (EoTP) are illustrated only for reference purposes below.

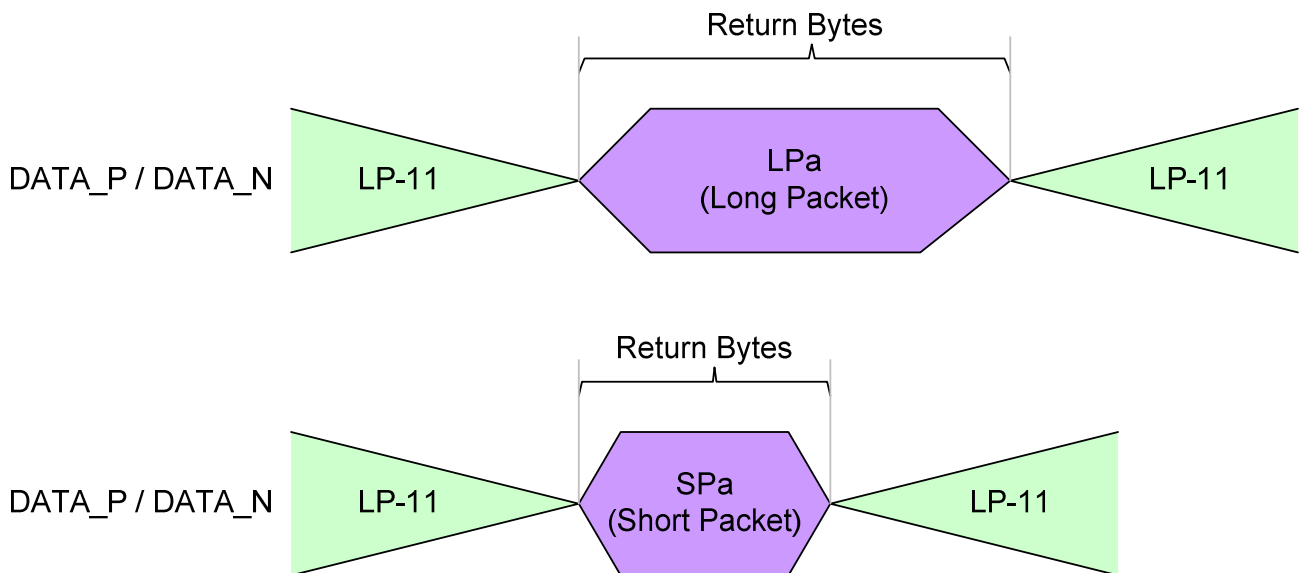

7.3.3.2.2. Packet from ILI9486 to MCU

7.3.3.2.2.1. Used Packet Types

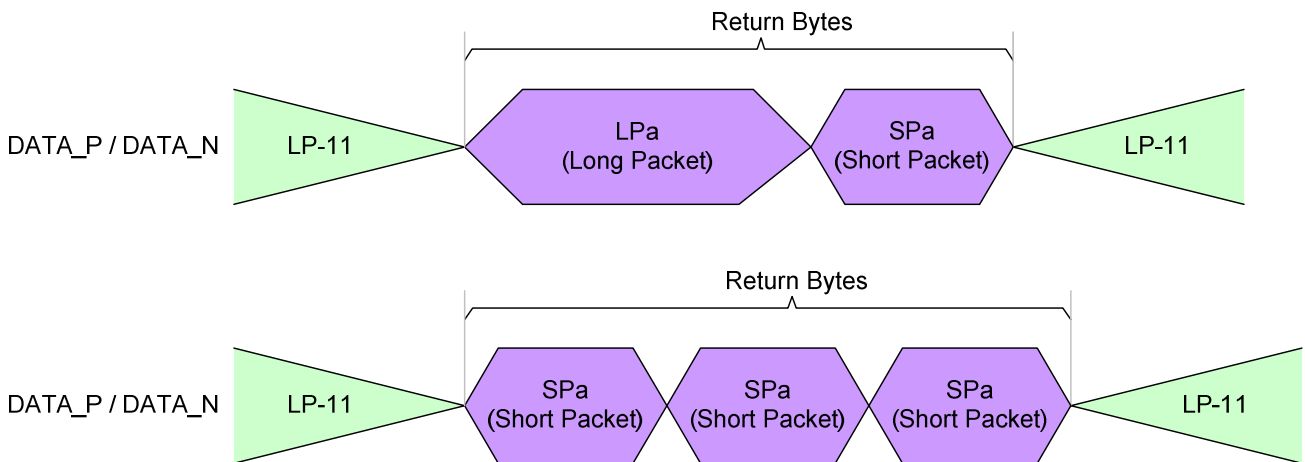

ILI9486 is always using Short Packet (SPa) or Long Packet (LPa), when it is returning information to the MCU after the MCU has requested information from ILI9486. This information can be a response of the Display Command Set (DCS) or an Acknowledge with Error Report (AwER). The used packet type is defined on Data Type (DT).

It is not possible that ILI9486 is sending return bytes in several packets even if the maximum size of the Packet Data (PD) could be sent in one packet.

The return bytes on a single packet are illustrated for reference purposes below.

The return bytes on several packets are illustrated for reference purposes below.

7.3.3.2.2. Acknowledge with Error Report

“Acknowledge with Error Report” (AwER) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0010b), from ILI9486 to the MCU.

The Packet Data (PD) can include bits, which are defining the current error, when a corresponding bit is set to ‘1’, as they are defined on the following table.

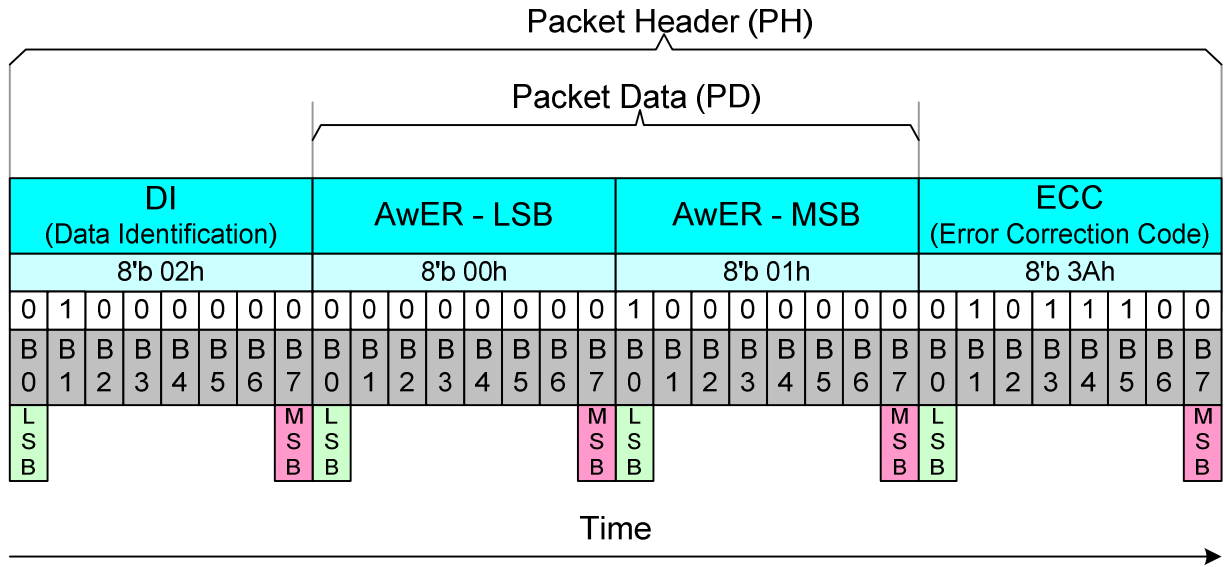

Bit	The Description of Acknowledge Error Report (AwER)	
	Short Packet	Long Packet
0	SoT Error	SoT Error
1	SoT Sync Error	SoT Sync Error
2	EoT Sync Error	EoT Sync Error
3	Escape Mode Entry Command Error	Escape Mode Entry Command Error
4	Low-Power Transmit Error	Low-Power Transmit Error
5	Any Protocol Timer-Out	Any Protocol Timer-Out
6	False Control Error	False Control Error
7	Contention is Detected on the Display Module	Contention is Detected on the Display Module
8	ECC Error, Single-Bit (Detected and Corrected)	ECC Error, Single-Bit (Detected and Corrected)
9	ECC Error, Multi-Bit (Detected, Not Corrected)	ECC Error, Multi-Bit (Detected, Not Corrected)
10	Reserved, Set to ‘0’ internally	Checksum Error
11	DSI Data Type (DT), Not Recognized	DSI Data Type (DT), Not Recognized
12	DSI Virtual Channel (VC) ID Invalid	DSI Virtual Channel (VC) ID Invalid
13	DSI Protocol Violation	DSI Protocol Violation
14	Reserved, Set to ‘0’ internally	Reserved, Set to ‘0’ internally
15	Reserved, Set to ‘0’ internally	Reserved, Set to ‘0’ internally

These errors are included from all packages what has been received from the MCU to ILI9486, before Bus Turnaround (BTA). ILI9486 ignores the received packet which includes error or errors.

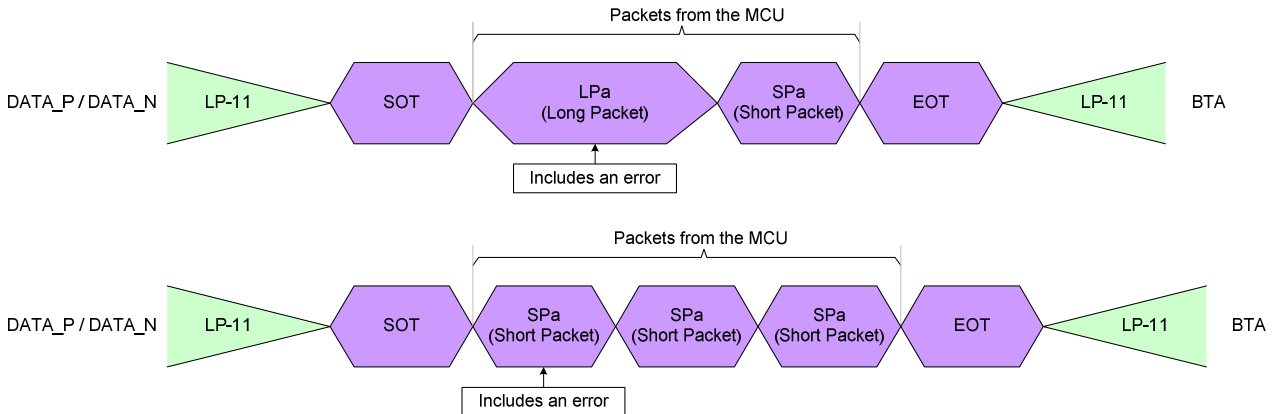

Acknowledge with Error Report (AwER) of the Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 00 0010b
- Packet Data (PD)
 - Bit 8: ECC Error, single-bit (detected and corrected)
 - AwER: 0100h
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

It is possible that ILI9486 has received several packets, which have included errors, from the MCU before the MCU is doing Bus Turnaround (BTA). Some examples are illustrated for reference purposes below.

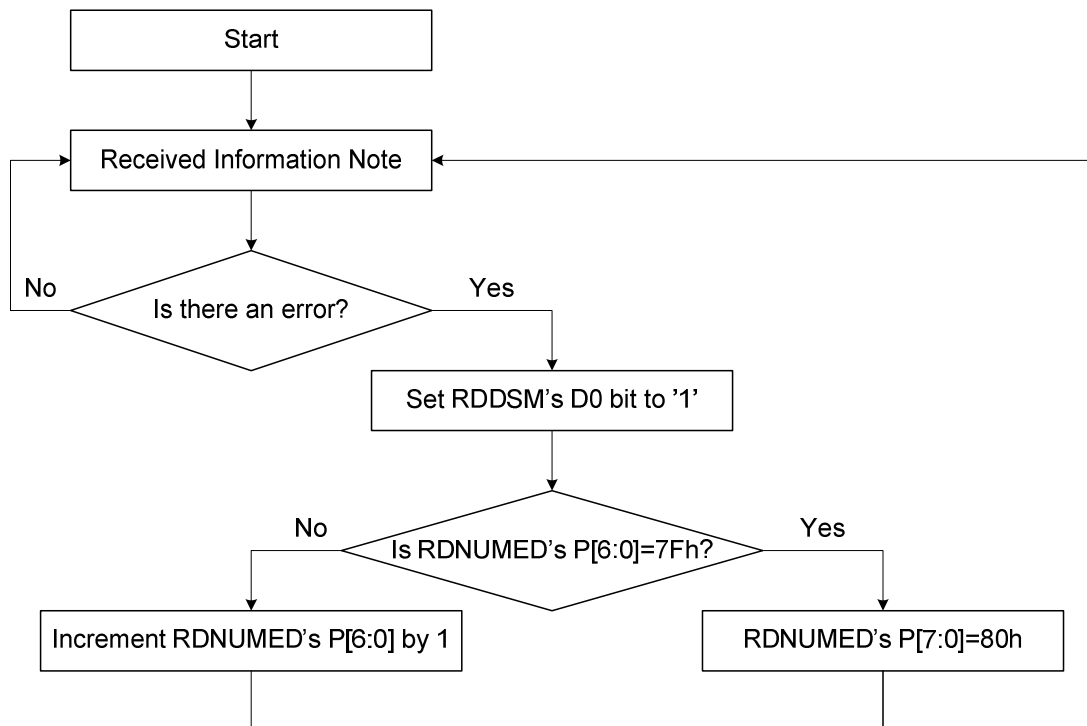

Therefore, there is needed a method to check if there has been errors on the previous packets. These errors of the previous packets can check “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands.

The bit D0 of the “Read Display Signal Mode (0Eh)” command has been set to ‘1’ if a received packet includes an error.

The numbers of the packets, which are including an error, are calculated on the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command. This command also sets the RDNUMED register to 00h as well as set the bit D0 of the “Read Display Signal Mode (0Eh)” command to ‘0’ after the MCU has read the RDNUMED register from ILI9486.

The functionality of the RDNUMED register is illustrated for reference purposes below.

Note: This information can Interface or Packet Level Communication but it is always from the MCU to ILI9486 in this case.

7.3.3.2.2.3. DCS Read Long Response (DCSRR-L)

“DCS Read Long Response” (DCSRR-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 01 1100b), from ILI9486 to the MCU.

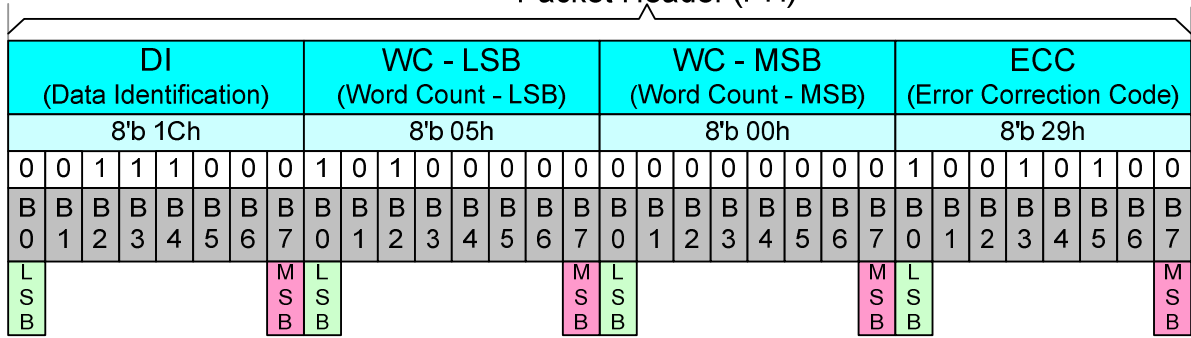

“DCS Read Long Response” (DCSRR-L) is used when ILI9486 wants to response a DCS Read command, which the MCU has sent to ILI9486.

Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), is defined e.g.

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 01 1100b
- Word Count (WC)
 - Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: 89hex
 - Data 1: 23hex
 - Data 2: 12hex
 - Data 3: A2hex
 - Data 4: E2hex
- Packet Footer (PF)

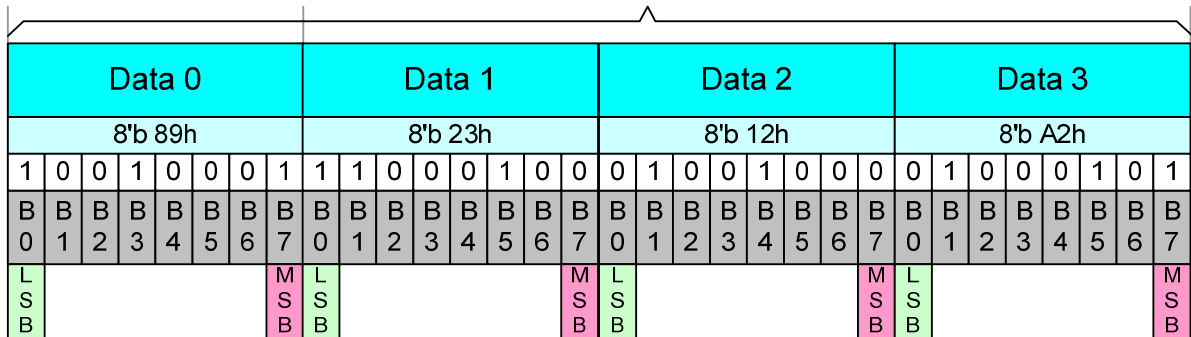

This is defined on the Long Packet (LP) as follows.

Packet Header (PH)

Time

Packet Data (PD)

Time

Packet Data (PD)

Packet Footer (PF)

Time

7.3.3.2.2.4. DCS Read Short Response, 1 Byte Returned (DCSRR1-S)

“DCS Read Short Response, 1 Byte Returned” (DCSRR1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0001b), from ILI9486 to the MCU.

“DCS Read Short Response, 1 Byte Returned” (DCSRR1-S) is used when ILI9486 wants to response a DCS Read command, which the MCU has sent to ILI9486.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 10 0001b
- Packet Data (PD)
 - Data 0: 45hex
 - Data 1: 00hex (Always)
- Error Correction Code (ECC)

This is defined on the Short Packet (SP) as follows.

7.3.3.2.2.5. DCS Read Short Response, 2 Bytes Returned (DCSRR2-S)

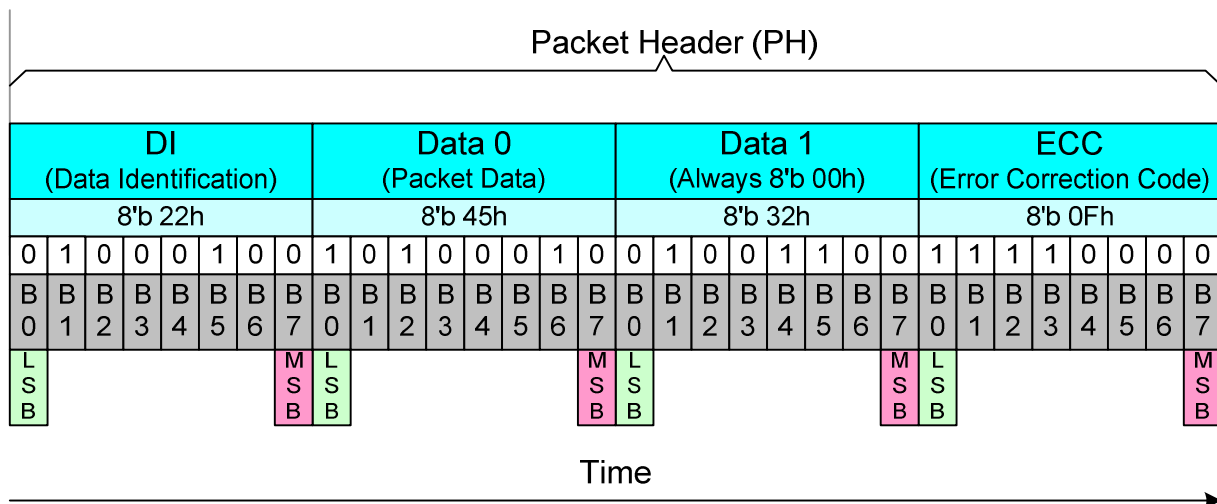

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0010b), from ILI9486 to the MCU.

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is used when ILI9486 wants to response a DCS Read command, which the MCU has sent to ILI9486.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI [7...6]): 00b
 - Data Type (DT, DI [5...0]): 10 0010b
- Packet Data (PD)
 - Data 0: 45hex
 - Data 1: 32hex
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

7.3.3.3. Communication Sequences

The communication sequences can be done on interface or packet levels between the MCU and ILI9486. This communication sequence description is for DSI data lanes (DSI-D0+/-) and it has been assumed that the needed low level communication is done on DSI clock lanes (DSI-CLK+/-) automatically.

Functions of the interface level communication are described on the following table.

Interface Mode	Abbreviation	Interface Action Description
Low Power	LP-11	Stop State
	LPDT	Low Power Data Transmission
	ULPS	Ultra-Low Power State
	RAR	Remote Application Reset
	TEE	Tearing Effect Event
	ACK	Acknowledge (No Error)
	BTA	Bus Turnaround
High Speed	HSDT	High speed Data Transmission

Functions of the packet level communication are described on the following table.

Interface Mode	Abbreviation	Packet Size	Interface Action Description
MCU	DCSW1-S	Short Packet	DCS Write, 1 Parameter
	DCSWN-S	Short Packet	DCS Write, No Parameter
	DCSW-L	Long Packet	DCS Write Long
	DCSRN-S	Short Packet	DCS Read, No Parameter
	SMRPS-S	Short Packet	Set Maximum Return Packet Size
	NP-L	Long Packet	Null Packet, No Data
	EoTP	Short Packet	End of Transmission Packet
ILI9486	AwER	Short Packet	Acknowledge with Error Packet
	DCSRR-L	Long Packet	DCS Read Long Response
	DCSRR1-S	Short Packet	DCS Read Short Response
	DCSRR2-S	Short Packet	DCS Read Short Response

7.3.3.3.1. DCS Write, 1 Parameter Sequence (DCSRR2-S)

A Short Packet (SPa) of “Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” is defined on chapter “7.3.3.2.1.3 Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” and example sequences, how this packet is used, is described on following tables.

DCS Write, 1 Parameter Sequence – Example 1						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	DCSW1-S	LPDT	→	--	--	
3	--	LP-11	→	--	--	End

13	--	--	←	LPDT	AwER	Error Report
14	--	--	←	LP-11	--	
15	--	BTA	↔	BTA	--	
16	--	LP-11	→	--	--	End

7.3.3.3.3. DCS Write, No Parameter Sequence

A Long Packet (LPa) of “Display Command Set (DCS) Write Long (DCSW-L)” is defined on chapter “7.3.3.2.1.4 Display Command Set (DCS) Write Long (DCSW-L)” and example sequences, how this packet is used, is described on following tables.

DCS Write Long Sequence – Example 1						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	DCSW-L	LPDT	→	--	--	
3	--	LP-11	→	--	--	End

DCS Write Long Sequence – Example 2						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	DCSW-L	HSDT	→	--	--	
3	EoTP	HSDT	→			End of Transmission Packet
4	--	LP-11	→	--	--	End

DCS Write Long Sequence – Example 3						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	DCSW-L	HSDT	→	--	--	
3	EoTP	HSDT	→	--	--	End of Transmission Packet
4	--	LP-11	→	--	--	
5	--	BTA	↔	BTA	--	Interface Control Change from MCU to ILI9486
6	--	--	←	LP-11	--	If No Error → Go to Line 8 If Error Occurs → Go to Line 13
7						
8	--	--	←	ACK	--	No Error
9	--	--	←	LP-11	--	
10	--	BTA	↔	BTA	--	Interface Control Change from the ILI9486 to MCU
11	--	LP-11	→	--	--	End
12						
13	--	--	←	LPDT	AwER	Error Report
14	--	--	←	LP-11	--	
15	--	BTA	↔	BTA	--	
16	--	LP-11	→	--	--	End

DCS Write Long Sequence – Example 4						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	DCSW-L	HSDT	→	--	--	Memory Write (2Ch)
3	DCSW-L	HSDT	→	--	--	Memory Write Continue (3Ch)
4	DCSW-L	HSDT	→	--	--	Memory Write Continue (3Ch)
5	DCSW1-S	HSDT	→	--	--	Memory Write Continue (3Ch) with 1 Parameter
6	EoTP	HSDT	→	--	--	End of Transmission Packet
7	--	LP-11	→	--	--	End

Note: This is an example where is wanted to send image data in 4 packets.

7.3.3.3.4. DCS Read, No Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Read, No Parameter (DCSRN-S)” is defined on chapter “7.3.3.2.1.5 Display Command Set (DCS) Read, No Parameter (DCSRN-S)” and example sequences, how this packet is used, is described on following tables.

DCS Read, No Parameter Sequence – Example 1						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	SMRPS-S	HSDT	→	--	--	Defined how many data byte is wanted to read : 1 byte

23	--	LP-11	→	--	--	End

7.3.3.3.5. Null Packet, No Data Sequence

A Long Packet (LPa) of “Null Packet, No Data (NP-L)” is defined on chapter “7.3.3.2.1.6 Null Packet, No Data (NP-L)” and an example sequence, how this packet is used, is described on the following table.

Null Packet, No Data Sequence – Example						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	NP-L	HSDT	→	--	--	Only High Speed Data Transmission is used
3	EoTP	HSDT	→	--	--	End of Transmission Packet
4	--	LP-11	→	--	--	End

7.3.3.3.6. End of Transmission Packet

A Short Packet (SPa) of “End of Transmission Packet (EoTP)” is defined on chapter “7.3.3.2.1.7 End of Transmission Packet (EoTP)” and an example sequence, how this packet is used, is described on the following table.

End of Transmission Packet – Example						
Line	MCU		Information Direction	ILI9486		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	--	LP-11	→	--	--	Start
2	NP-L	HSDT	→	--	--	Only High Speed Data Transmission is used
3	EoTP	HSDT	→	--	--	End of Transmission Packet
4	--	LP-11	→	--	--	End

7.4. CABC (Content Adaptive Brightness Control)

ILI9486 provides a dynamic backlight control function as CABC (Content adaptive brightness control) to reduce the power consumption of the luminance source. ILI9486 will refer the gray scale content of display image to output a PWM waveform to LED driver for backlight brightness control. Content adaptation means that the content of gray sale can be increased while simultaneously lowering brightness of the backlight to achieve the same perceived brightness. The adjusted gray level scale and thus the power consumption reduction depend on the content of the image.

ILI9486 can calculate the backlight brightness level and send a PWM pulse to LED driver via PWM_OUT pin for backlight brightness control purpose. The PWM frequency can be adjusted by PWM_DIV parameters and the calculating equation as below:

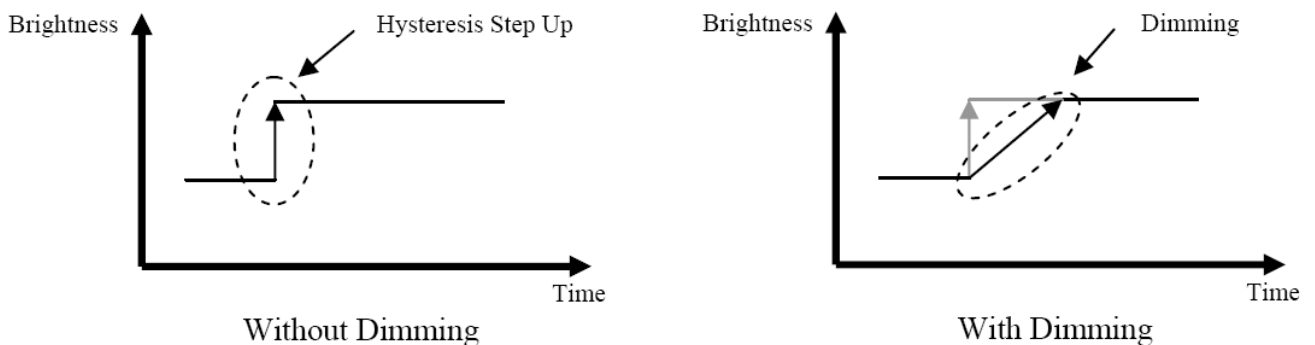

$$f_{PWM_OUT} = \frac{18MHz}{(PWM_DIV[7:0]+1) \times 255}$$

The figure in the following is the basic timing diagram which is applied ILI9486 to control LED driver.

Display Backlight Dimming Control

A dimming function (how fast to change the brightness from old to new level and what are brightness levels during the change) is used when changing from brightness level to another. This dimming function curve is the same in increment and decrement directions. The basic idea is described below.

Dimming function can be enabled and disabled. See command "Write CTRL Display(53h), bit3(DD) for more information.

Dimming Requirement

Dimming function in the display module should be implemented so that 400 – 600ms is used for the transition between the original brightness value and the target brightness value. The transferring time steps between these two brightness values are equal making the transition linear.

The dimming function is working similarly in both upward and downward directions.

An upward example is illustrated below.

7.5. MDDI (Mobile Display Digital Interface)

MDDI (Mobile display digital interface) is a differential small amplitude serial interface for high-speed data transfer via following 4 lines: Stb+/- (MDDI_STB_P, MDDI_STB_M), Data+/- (MDDI_DATA_P, MDDI_DATA_M). The specifications of MDDI supported by the ILI9486 are compatible to the MDDI specifications disclosed by VESA, Video Electronics Standards Association. The following are the specifications particular to the ILI9486's MDDI.

ILI9486 MDDI Specifications

- MDDI Type-I
- High-speed, differential, small-amplitude data transfer via Stb+/-, Data+/- lines
- MDDI client: the ILI9486 enables direct connection to the base band (BB) chip without bridge chip
- Cost-performance optimized interface for mobile display systems
 1. Only internal mode (one client) and Forward Link are supported
 2. Hibernation mode to save power consumption
 3. Tearing-free moving picture display via FMARK/VSYNC interface
 4. Moving picture display with low power consumption, realized by the features 2 ~ 3
 5. Shutdown mode for saving power consumption in the standby state

Notes:

1. An external end resistor of 100 ohm is necessary between Data+ and Data- lines
2. Make the COG wiring resistances of Data+/-, Stb+/- lines as small as possible ($R_{COG} < 10 \text{ ohm}$).

MDDI Link Protocol (Packets Supported by the ILI9486)

The MDDI Link Protocol of the ILI9486 is in line with the MDDI specifications disclosed by VESA. See the MDDI specifications by VESA for details on the MDDI Link Protocol.

The MDDI packets supported by the ILI9486 are as follows. Do not send packets not supported by the ILI9486 in the system incorporating the ILI9486.

Refer to MDDI packet structure, sub-frame header packet is placed in front of a sub-frame and some sub-frame construct media-frame together. The following table describes 9 types of packet which is supported in ILI9486.

Packet	Function	Direction
Sub-frame header packet	Header of each sub frame	Forward
Register access packet	Register setting	Forward
Video stream packet	Video data transfer	Forward
Filler packet	Fill empty packet space	Forward
Reverse link encapsulation packet	Reverse data packet	Reverse
Round-trip delay measurement packet	Host->client->host delay check	Forward/Reverse
Client capability packet	Capability of client check	Reverse
Client request and status packet	Information about client status	Reverse
Link shutdown packet	End of frame	Forward

		Sub-Frame Header Packet							
		0	1	2	3	4	5	6	7
Bytes ↓	1	Packet Length							
	2	(0x0014)							
	3	Packet Type							
	4	(0x3bFF)							
	5	Unique Word							
	6	(0x005A)							
	7	Reserved 1							
	8	(0x0000)							
	9	Sub-Frame Length							
	10	-----							
	11	-----							
	12	-----							
	13	Protocol Version							
	14	(0x0000)							
	15	Sub-frame Count							
	16	-----							
	17	Media-frame Count							
	18	-----							
	19	-----							
	20	-----							
	21	CRC							
	22	(0x0000)							

Video Stream Packet

The ILI9486 writes image data to RAM via Video Stream Packet. The window and RAM addresses are set via Register Access Packet.

Note: The parameters colored in gray are not supported by the ILI9486.

Video Data Format Descriptor: sets the pixel data format. The ILI9486 supports only the following format. Set the same pixel format (bpp) as selected by DSS[1:0] in Video Data Format Descriptor.

[15:13]	[12]	[11:8]	[7:4]	[3:0]	
010	1	0x5	0x6	0x5	Packed 16bpp RGB format (R:G:B=5:6:5)
010	1	0x6	0x6	0x6	Packed 18bpp RGB format (R:G:B=6:6:6)
Others					Setting disabled

	MDDI Bytes n								MDDI Bytes (n+1)								MDDI Bytes (n+2)							
	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
Packet 16bpp	0	1	2	3	4	0	1	2	3	4	5	0	1	2	3	4	0	1	2	3	4	0	1	2
	Pixel 1 Blue				Pixel 1 Green				Pixel 1 Red				Pixel 2 Blue				Pixel 2							
Packet 18bpp	0	1	2	3	4	5	0	1	2	3	4	5	0	1	2	3	4	5	0	1	2	3	4	5
	Pixel 2 Blue				Pixel 2 Green				Pixel 2 Red				Pixel 2 Blue											

Pixel Data Attributes: the image data sent via Video Stream Packet is recognized as either the data for the main-panel or for the sub-panel according to the setting in [1:0] bits in this field.

Pixel Data Attributes	Bits[1:0]	Description
0x0000	00	The ILI9486 don't support the sub-panel display..
0x0001	01	Setting disabled
0x0002	10	Setting disabled
0x0003	11	The Video Stream Packet data is recognized as the data written in the ILI9486. The Video Stream Packet data is written in the ILI9486 and not outputted via sub-display interface.

Register Access Packet

Register Access Packet is used when setting instruction to the ILI9486.

Note: The parameters colored in gray are not supported by the ILI9486.

Read/Write Info: Read or Write information in register access. The ILI9486 supports the following access setting.

Bits[15:14]	Bits[13:00]	Description
2'b00	0xn	Write one register by register access packet
2'b01	0xn	Reserved
2'b10	0xn	Read one register by register access packet
2'b11	0xn	Response to read

Register Address: The index of the register to be accessed is set in Register Address area and the Register Address Packet is directed to the ILI9486 or the sub display is determined by the setting in Register Address area.

Bits[31:16]	Description
16'h0000	The Register Access Packet is directed to the ILI9486 via main-display interface.
16'h0002 ~ 16'h7FFF	Setting disabled

Bits[15:0]	Description
16'h0000~FFFF	Bits [15:0] are used as index [15:0].

Register Data: The data for register access is written in Register Data. The length of Register Data will depends on the parameter length of command.

Example of Register Access Packet (e.g. write to the ILI9486)

	0	1	2	3	4	5	6	7
1	Packet Length					(0x16)		
2	(0x00)							
3	Packet Type					(0x92)		
4	(0x00)							
5	bClient ID					(0x00)		
6	(0x00)							
7	Read/Write Info.					(0x01)		
8	(0x00)							
9	Register Address					(index ID[7:0])		
10	(index ID[15:8])							
11						(0x00) → Main Panel (ILI9486)		
12	(0x00)							
13	Parameter CRC

15	Register Data List (Various Length)					1 st Parameter		
16	0x00							
17	0x00							
18	0x00							
19						2 nd Parameter		
20	0x00							
21	0x00							
22	0x00							
23	Parameter CRC							
24								

Note: The parameters colored in gray are not supported by the ILI9486.

Register Access Packet Restrictions

The ILI9486's internal RAM is accessible via Video Stream Packet. RAM access data is not included in Register Access Packet.

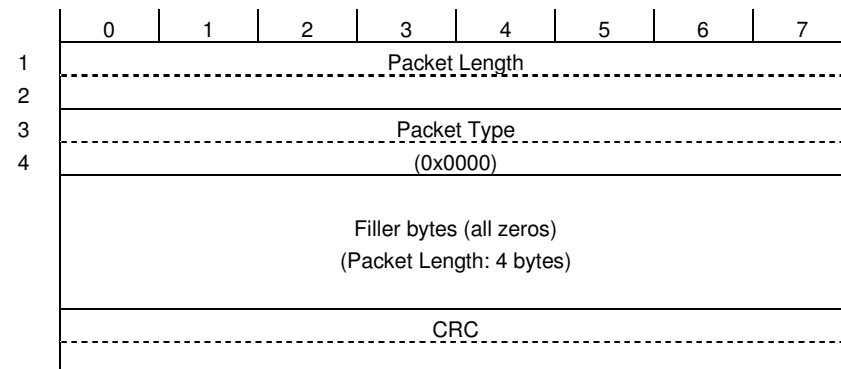

Link Shutdown Packet

This packet is used to bring Link to the Hibernation state.

Note: The parameters colored in gray are not supported by the ILI9486.

Filler Packet

Hibernation Setting

The ILI9486's Client MDDI supports Hibernation setting. There are two ways to cancel the Hibernation setting, which can be selected according to the condition of use.

Hibernation Cancellation

Host-initiated wake up	In power-saving mode such as standby
TE-initiated wake up	Save power consumption in transferring moving picture data Host-initiated wake up triggered by the output from TE.

The Hibernation setting and cancellation sequence must be compatible with the VESA-MDDI specifications.

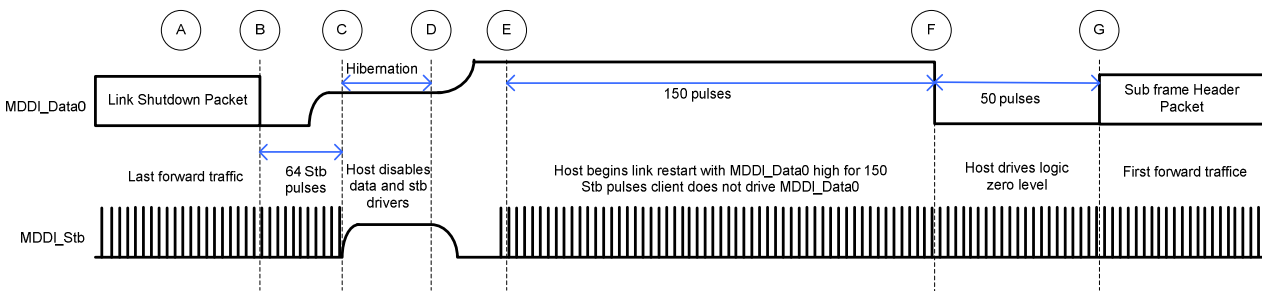

Host-Initiated Wake up from Hibernation

The host initiated wake up is described below without contention from the client trying to wake up at the same time. The following sequence of events is illustrated in the figures below!

- A. The host sends a Link Shutdown Packet to inform the client that the link will transition to the low power hibernation state.
- B. Following the CRC of the Link Shutdown Packet the host toggles MDDI_Stb for 64 cycles to allow processing in the client to finish before it stops MDDI_Stb from toggling which stops the recovered clock in the client device. During the interval the host initially sets MDDI_Data0 to a logic zero level, and then disables the MDDI_Data0 output in the range of 16 to 48 MDDI_Stb cycles (including output disable propagation delays) after the CRC. It may be desirable for the client to place its high-speed receivers for MDDI_Data0 and MDDI_Stb into a low power state any time after 48 MDDI_Stb cycles after the CRC and before point C.
- C. The host enters the low power hibernation state by disabling the MDDI_Data0 and MDDI_Stb drivers and by placing the host controller into a low power hibernation state. It is also allowable for MDDI_Stb to be driven to a logic zero level or to continue toggling during hibernation. The client is also in the low power hibernation

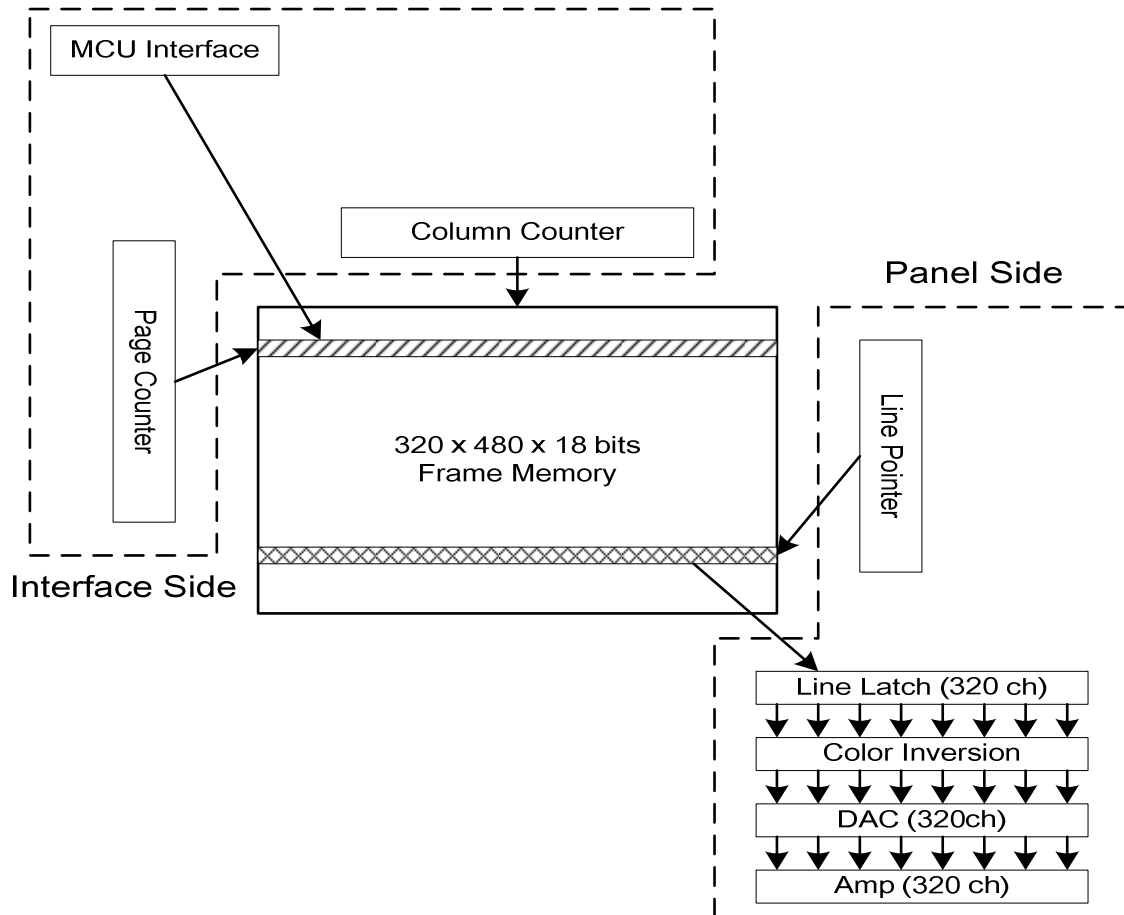

state.

- D. After a while, the host begins the line restart sequence by enabling the MDDI_Data0 and MDDI_Stb driver outputs. The host drives MDDI_Data0 to a logic one level and MDDI_Stb to a logic zero level for at least 200nsec after MDDI_Data0 reaches a valid logic one level and MDDI_Stb reaches a valid logic zero level before driving pulses on MDDI_Stb. This gives the client sufficient time to prepare to receive high speed pulses on MDDI_Stb. The client first detects the wake up pulse using a low power differential receiver having a +125mV input offset voltage.
- E. The host drivers are fully enabled and MDDI_Data0 is being driven to a logic one level. The host begins to toggle MDDI_Stb in a manner consistent with having a logic zero level on MDDI_Data0 for a duration of 150 MDDI_Stb cycles.
- F. The host drives MDDI_Data0 to a logic zero level for 50 MDDI_Stb cycles. The client begins to look for the Sub frame Header Packet after MDDI_Data0 is at a logic zero level for 40 MDDI_Stb cycles.
- G. The host begins to transmit data on the forward link by sending a Sub-frame Header packet. Beginning at point G the MDDI host generates MDDI_Stb based on the logic level on MDDI_Data0 so that proper data-strobe encoding commences from point G.

7.6. Display Data RAM (DDRAM)

The ILI9486 has an integrated 320x480x18-bit graphic type static RAM. This 345,600-byte memory allows storing a 320xRGBx480 image with an 18-bit resolution (262K-color). There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

7.7. Display Data Format

ILI9486 supplies 18-/16-/9-/8-bit parallel MCU interface with 8080-series and 3-/4-line serial interface and 16-/18-bit parallel RGB interface. The parallel MCU interface and serial interface mode can be selected by external pins IM [2:0].

7.7.1. 3-line Serial Interface

The 3-line/9-bit serial bus interface of ILI9486 can be used by setting external pin as IM [2:0] to "101". The figure in the following is the example of interface with 8080 microcomputer system interface.

In 3-line serial interface, different display data formats are available for two color depths supported by the LCM listed below.

-8 colors, RGB 1, 1, 1 -bits input

-262k colors, RGB 6, 6, 6 -bits input.

3 bit/pixel color order (R:1-bit, G:1-bit, B:1-bit), 8 colors

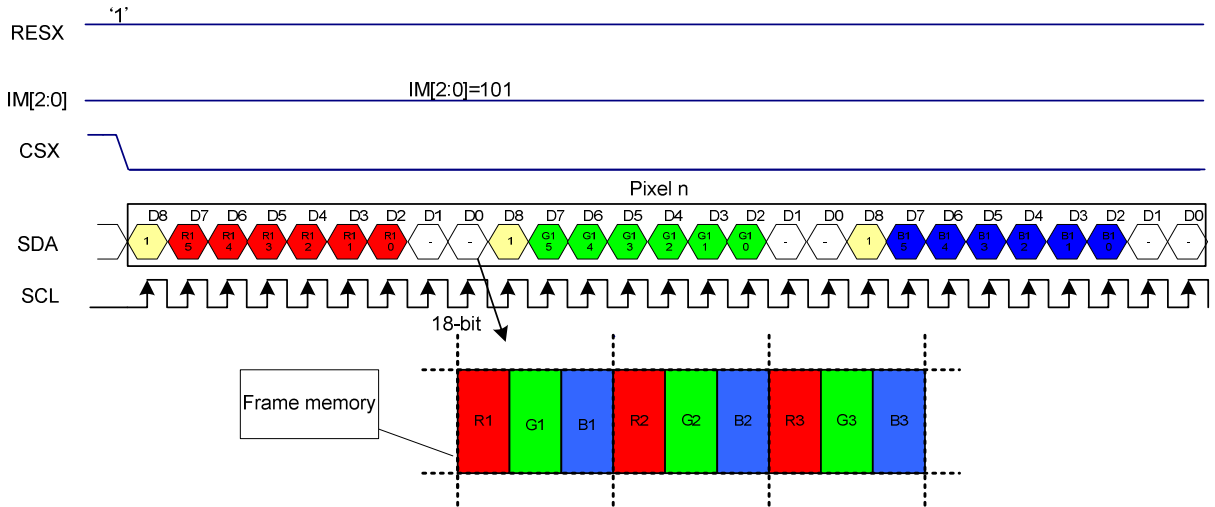

Note 1: The pixel data with 16-bit color depth information.

Note 2: The most significant bits are: Rx4, Gx5 and Bx4.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-'= Don't care – Leave these pins to Open.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The pixel data with 18-bit color depth information.

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are : Rx0, Gx0 and Bx0.

Note 4: '-'= Don't care - Leave these pins to Open.

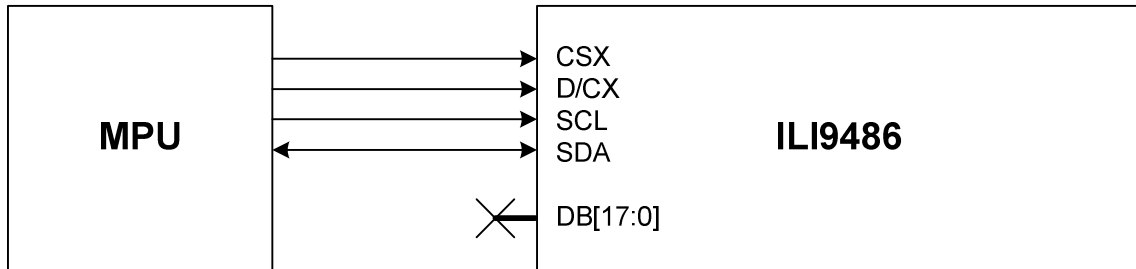

Read data through 3-line SPI mode

Note 1: '-'= Don't care – Leave these pins to Open.

7.7.2. 4-line Serial Interface

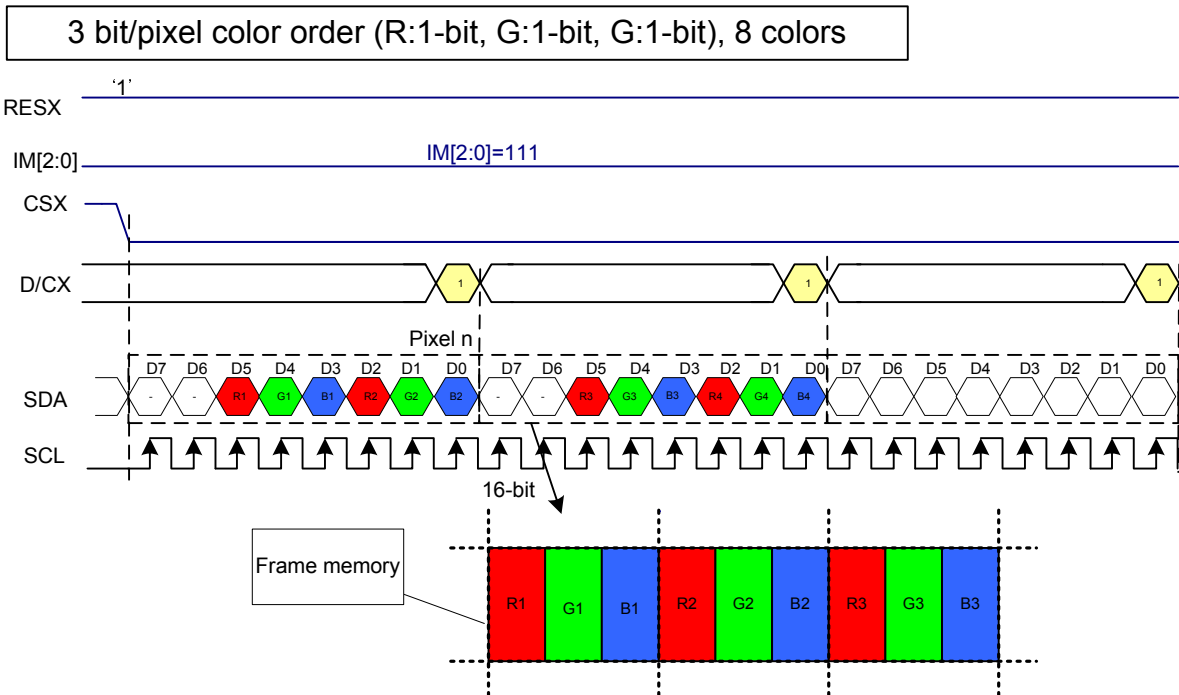

The 4-line/8-bit serial bus interface of ILI9486 can be used by setting external pin as IM [2:0] to "111". The figure in the following is the example of interface with 8080 microcomputer system interface.

In 4-line serial interface, different display data formats are available for two color depths supported by the LCM listed below.

-8 colors, RGB 1, 1, 1 -bits input.

-262k colors, RGB 6, 6, 6 -bits input.

Note : '-'= Don't care – Leave these pins to Open.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit) , 262,144 colors

Note 1: The pixel data with 18-bit color depth information.

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-=' Don't care – Leave these pins to Open.

Read data through 4-line SPI mode

Read Data format as below

Note 1: '-=' Don't care – Leave these pins to Open.

7.7.3. 8-bit Parallel MCU Interface

The 8080-system 8-bit parallel bus interface of ILI9486 can be used by setting external pin as IM [2:0] to "011".

The figure in the following is the example of interface with 8080 microcomputer system interface.

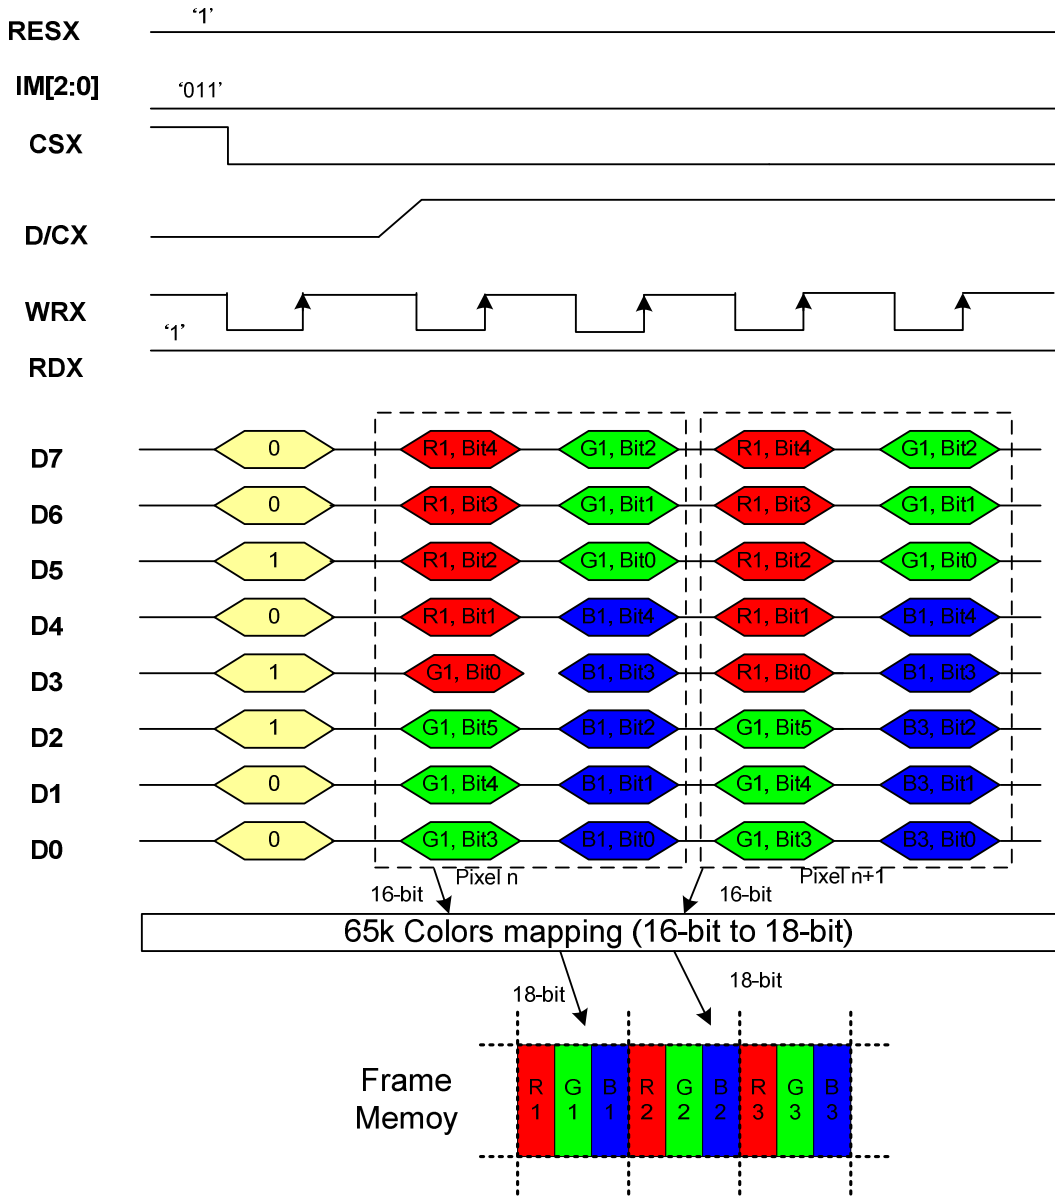

Different display data formats are available for two color depths supported by listed below.

- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.7.3.1. 8-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color

16 bit/pixel color order (R:5-bit, G:6-bit, B:5-bit), 65,536 colors

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green data and MSB=Bit 4, LSB=Bit0 for Red and Blue data.

Note 2: 2-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-=' Don't care – Leave these pins to Open.

7.7.3.2. 8-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

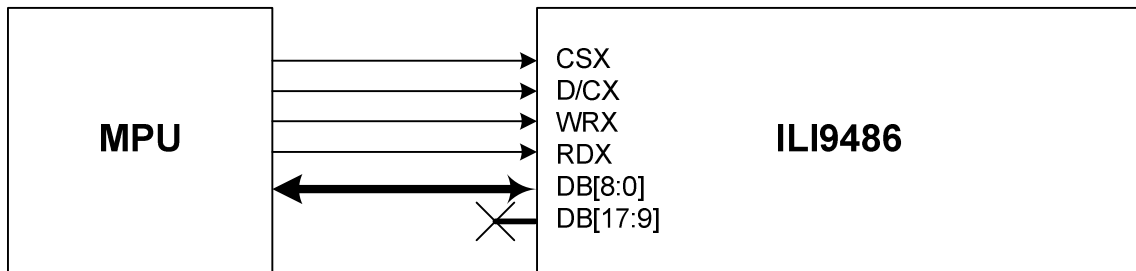

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-=' Don't care – Leave these pins to Open.

7.7.4. 9-bit Parallel MCU Interface

The 8080-system 9-bit parallel bus interface of ILI9486 can be used by setting external pin as IM [2:0] to "001". The figure in the following is the example of interface with 8080 microcomputer system interface.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

Note 2: 2-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

7.7.5. 16-bit Parallel MCU Interface

The 8080-system 16-bit parallel bus interface of ILI9486 can be used by setting external pin as IM [2:0] to "010". The figure in the following is the example of interface with 8080 microcomputer system interface.

Different display data formats are available for two colors depth supported by listed below.

- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.7.5.1. 16-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green data and MSB=Bit 4, LSB=Bit0 for Red and Blue data.

Note 2: 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

7.7.5.2. 16-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

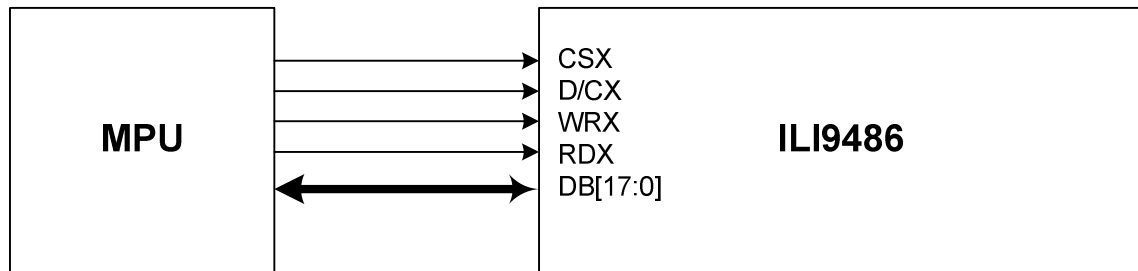

Note 2: 2-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

7.7.6. 18-bit Parallel MCU Interface

The 8080-system 18-bit parallel bus interface of ILI9486 can be used by setting external pin as IM [2:0] to “000”.

The figure in the following is the example of interface with 8080 microcomputer system interface.

Different display data formats are available for one color depth only supported by listed below.

- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.7.6.1. 18-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

Note 1: The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green and MSB=Bit4, LSB=Bit0 for Red and Blue data.

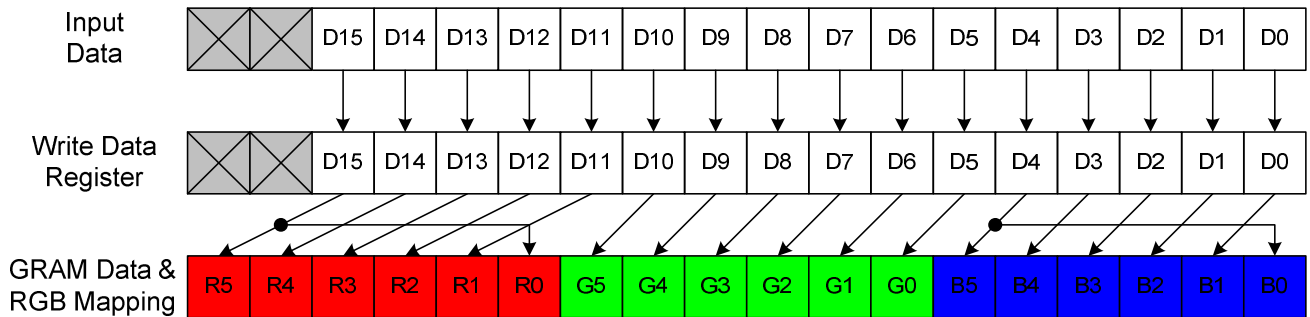

Note 2: 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

7.7.7. 16-bit Parallel RGB Interface

The 16-bit RGB interface is selected by setting the DPI[2:0] bits to “101”. The display operation is synchronized with VSYNC, HSYNC and DOTCLK signals. The display data are transferred to the internal GRAM in synchronization with the display operation via 16-bit RGB data bus (D[15:0]). Both D17 and D16 pins must be left to OPEN for ensure normally operation. Registers can be set by the system interface.

7.7.8. 18-bit Parallel RGB Interface

The 18-bit RGB interface is selected by setting the DPI[2:0] bits to “110”. The display operation is synchronized with VSYNC, HSYNC and DOTCLK signals. The display data are transferred to the internal GRAM in synchronization with the display operation via 18-bit RGB data bus (DB[17:0]) according to the data enable signal (ENABLE). Registers can be set by the system interface.

7.7.9. MIPI - DSI

Packed Pixel Stream 16-Bit Format is a Long packet used to transmit image data formatted as 16-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte checksum. Pixel format is five bits red, six bits green, five bits blue, in that order. Note that the “Green” component is split across two bytes. Within a color component, the LSB is sent first, the MSB last.

With this format, pixel boundaries align with byte boundaries every two bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of two bytes.

Normally, ILI9486 has no frame buffer of its own, so all image data shall be supplied by the host processor at a sufficiently high rate to avoid flicker or other visible artifacts.

7.7.10. MIPI – 18-bit per Pixel, Long packet, Data Type = 01 1110 (1Eh)

Packed Pixel Stream 18-Bit Format (Packed) is a Long packet. It is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. Pixel format is red (6 bits), green (6 bits) and blue (6 bits), in that order. Within a color component, the LSB is sent first, the MSB last.

Note that pixel boundaries only align with byte boundaries every four pixels (nine bytes). Preferably, display modules employing this format have a horizontal extent (width in pixels) evenly divisible by four, so no partial bytes remain at the end of the display line data. If the active (displayed) horizontal width is not a multiple of four pixels, the transmitter shall send additional fill pixels at the end of the display line to make the transmitted width a multiple of four pixels. The receiving peripheral shall not display the fill pixels when refreshing the display device. For example, if a display device has an active display width of 399 pixels, the transmitter should send 400 pixels in one or more packets. The receiver should display the first 399 pixels and discard the last pixel of the transmission.

With this format, the total line width (displayed plus non-displayed pixels) should be a multiple of four 1246 pixels (nine bytes).

7.7.11. MIPI – 18-bit per Pixel, Long packet, Data Type = 10 1110 (2Eh)

In the 18-bit Pixel Loosely Packed format, each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires three bytes as it is transmitted across the Link. This requires more bandwidth than the “packed” format, but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the Link.

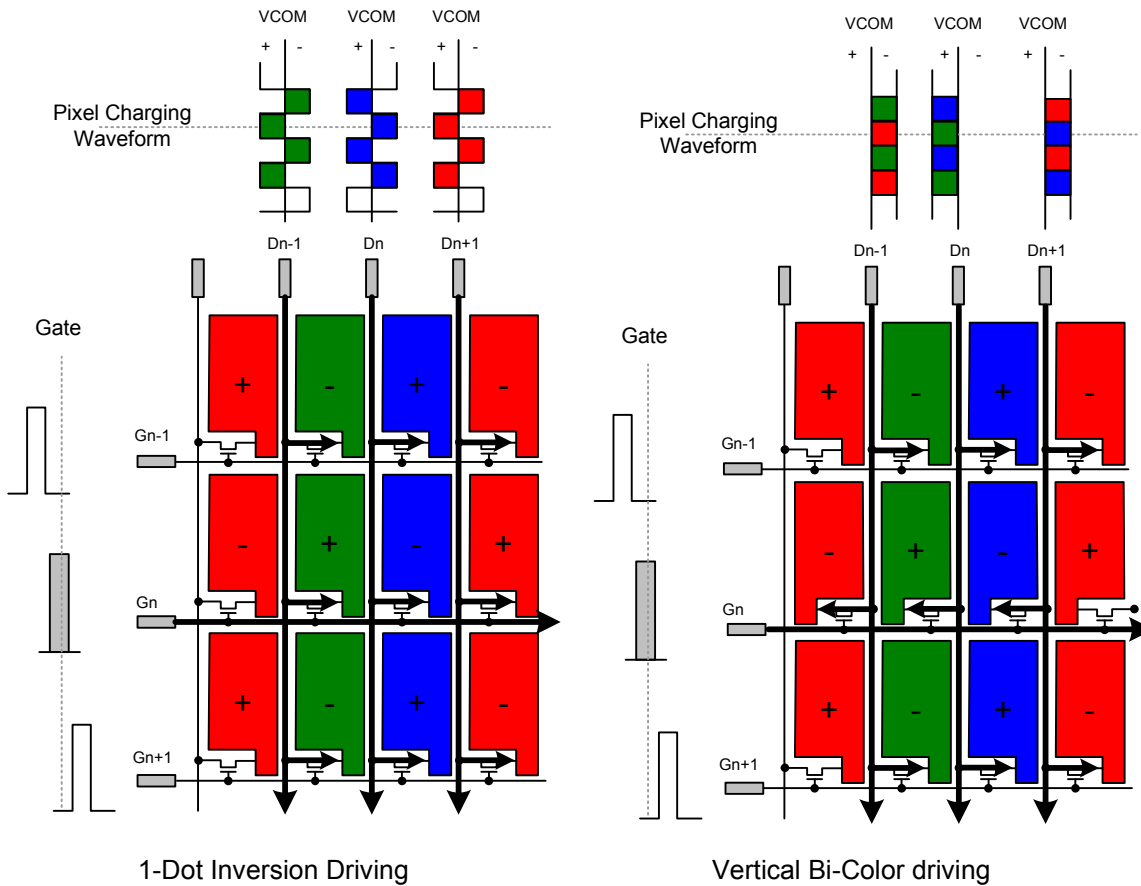

This format is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (6 bits), green (6 bits) and blue (6 bits) in that order. Within a color component, the LSB is sent first, the MSB last.

With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

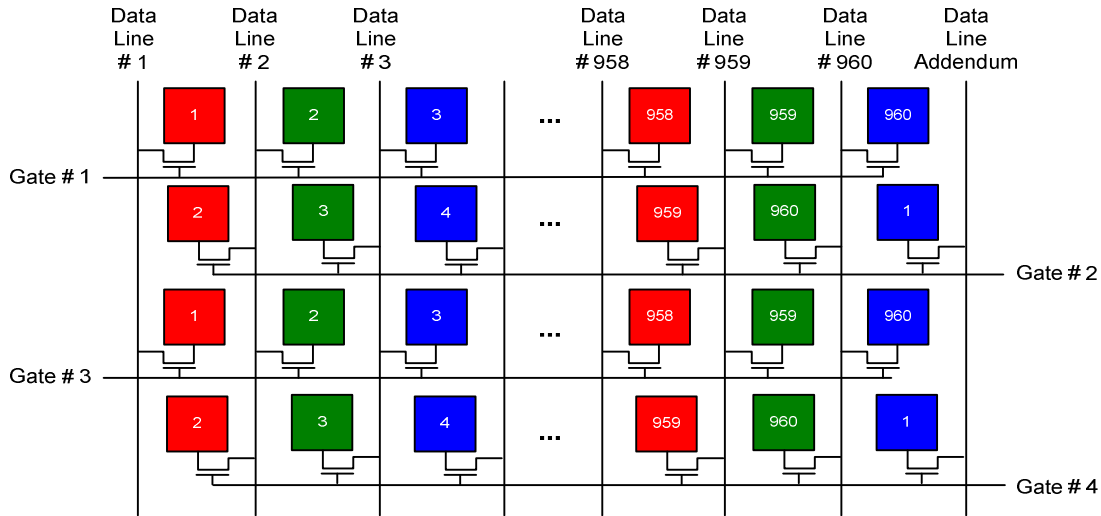

7.8. Z-inversion

The ILI9486 supports Z-inversion for reduce power consumption. The Zigzag can decrease the switching frequency, relative to the magnitude of the display power consumption, and the switching level. This method will have a addendum data line after the last data line.

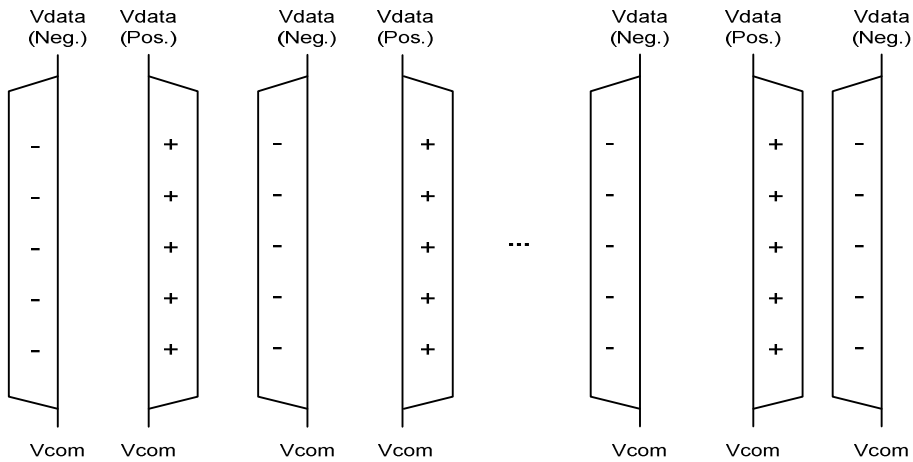

7.8.1 Z-inversion concept

The Zigzag method uses the same polarity of data line of the column inversion to show out the 1-dot inversion.

Column Inversion

1-Dot Inversion

7.8.2 Z-inversion Odd/Even Gate data input method

Gate_Odd line : using the normally data input mode and put on the R, G, B data to sub-pixel R, G, B respectively.

Gate_Even line : put on the G, B, R data to sub-pixel R, G, B respectively.

Gate_Odd Line Data Input

Gate_Even Line Data Input

7.8.3 Z-inversion data input method

The driving panel display method is that added the one sub pixel at the Gate_Even shift the data output.

Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	

Panel Driving

7.8.3.2 Z-inversion GREEN Data display

The below figure is normally panel driving method for Green data input. For driving Green pattern, the Green and Red sub pixel will light up line by line when the data signal input.

Input Data Signal

	Data #1	Data #2	Data #3	Data #4	Data #5	Data #6	...	Data #955	Data #956	Data #957	Data #958	Data #959	Data #960	Data Option
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	

Panel Driving

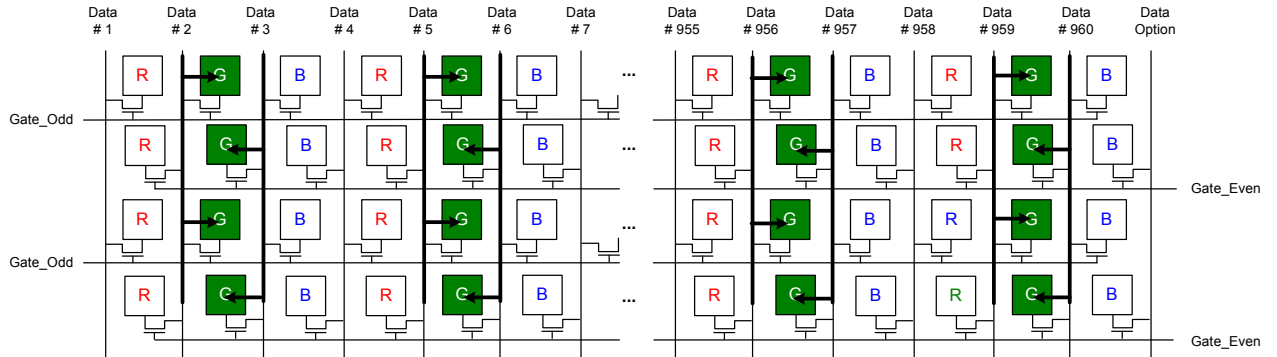

The below figure is Z-inversion panel driving method. The panel will be drive by the Green data input of the Gate_Odd and the Blue data input of the Gate_Even.

Input Data Signal

	Data #1	Data #2	Data #3	Data #4	Data #5	Data #6	...	Data #955	Data #956	Data #957	Data #958	Data #959	Data #960	Data Option
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	

Panel Driving

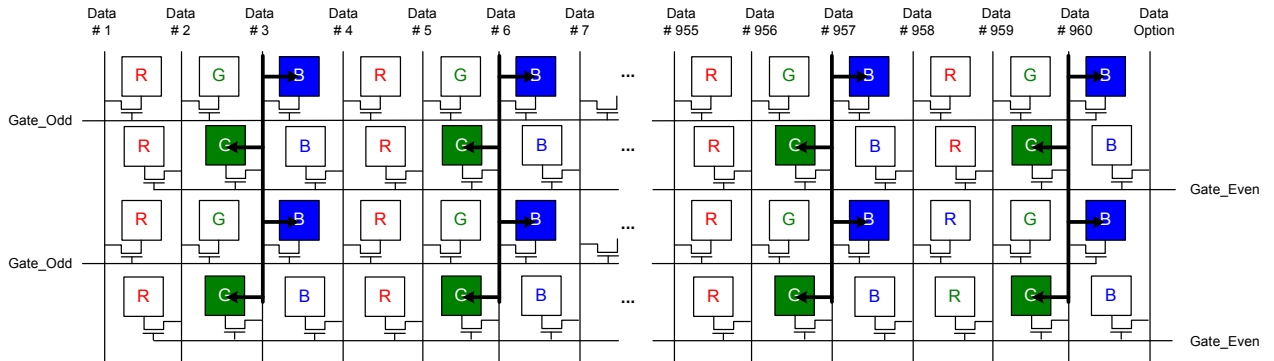

7.8.3.3 Z-inversion BLUE Data display

The below figure is normally panel driving method for Blue data input. For driving Blue pattern, the Blue and Green sub pixel will light up line by line when the data signal input.

Input Data Signal

	Data # 1	Data # 2	Data # 3	Data # 4	Data # 5	Data # 6	...	Data # 955	Data # 956	Data # 957	Data # 958	Data # 959	Data # 960	Data Option
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Odd	R	G	B	R	G	B		R	G	B	R	G	B	
Gate_Even	R	G	B	R	G	B		R	G	B	R	G	B	

Panel Driving

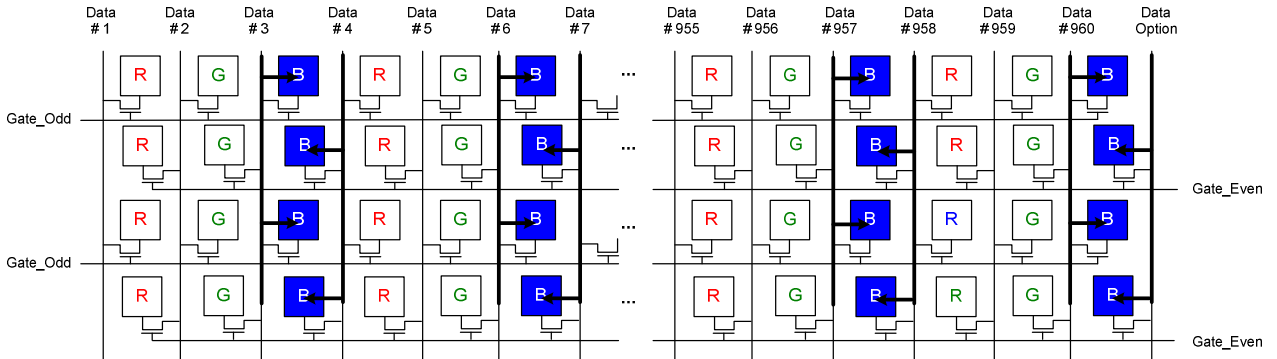

The below figure is Z-inversion panel driving method. The panel will be drive by the Blue data input of the Gate_Odd and the Red data input of the Gate_Even.

Input Data Signal

	Data # 1	Data # 2	Data # 3	Data # 4	Data # 5	Data # 6	...	Data # 955	Data # 956	Data # 957	Data # 958	Data # 959	Data # 960	Data Option

Flow Chart	 <p>The flow chart illustrates the sequence of operations between a Host and the ILI9486 chip. A dashed horizontal line separates the Host (top) from the ILI9486 (bottom). The sequence starts with the Host sending the RDDPM (0Ah) command (represented by a trapezoid). This is followed by a Dummy Read parameter (represented by a parallelogram) from the ILI9486. Finally, the ILI9486 sends the 2nd Parameter (represented by a parallelogram) back to the Host. A legend on the right defines the symbols: Command (trapezoid), Parameter (parallelogram), Display (rounded rectangle), Action (pentagon), Mode (oval), and Sequential transfer (oval with arrow).</p>

8.2.13. Sleep OUT (11h)

11h	SLPOUT (Sleep OUT)																								
	D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	XXXXXXXX	0	0	0	1	0	0	0	1	11h												
Parameter	No parameter																								
Description	<p>This command turns off sleep mode.</p> <p>In this mode e.g. the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started.</p>  <p>X = Don't care</p>																								
Restriction	<p>Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command; this is to allow time for the supply voltages and clock circuits to stabilize.</p> <p>ILI9486 loads all display supplier's factory default values to the registers during this 5msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when ILI9486 is already Sleep Out –mode.</p> <p>ILI9486 is doing self-diagnostic functions during this 5msec. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.</p>

4 th Parameter	1	1	↑	XXXXXXXX	VSA[7:0]							XX	
5 th Parameter	1	1	↑	XXXXXXXX	BFA[15:8]							XX	
6 th Parameter	1	1	↑	XXXXXXXX	BFA[7:0]							XX	

This command defines the display vertical scrolling area.

Memory Access Control (36h) B4 = 0:

The 1st & 2nd parameter, TFA[8:0], describes the Top Fixed Area in number of lines from the top of the frame memory. The top of the frame memory and top of the display device are aligned. The 3rd & 4th parameter, VSA[8:0], describes the height of the Vertical Scrolling Area in number of lines of frame memory from the Vertical Scrolling Start Address. The first line of the Vertical Scrolling Area starts immediately after the bottom most line of the Top Fixed Area. The last line of the Vertical Scrolling Area ends immediately before the top most line of the Bottom Fixed Area.

The 5th & 6th parameter, BFA[8:0], describes the Bottom Fixed Area in number of lines from the bottom of the frame memory. The bottom of the frame memory and bottom of the display device are aligned.

TFA, VSA and BFA refer to the Frame Memory Line Pointer.

Description

Memory Access Control (36h) B4 = 1:

The 1st & 2nd parameter, TFA[8:0], describes the Top Fixed Area in number of lines from the bottom of the frame memory. The bottom of the frame memory and bottom of the display device are aligned.

The 3rd & 4th parameter, VSA[8:0], describes the height of the Vertical Scrolling Area in number of lines of frame memory from the Vertical Scrolling Start Address. The first line of the Vertical Scrolling Area starts immediately after the top most line of the Top Fixed Area. The last line of the Vertical Scrolling Area ends immediately before the bottom most line of the Bottom Fixed Area.

The 5th & 6th parameter, BFA[8:0], describes the Bottom Fixed Area in number of lines from the top of the frame memory. The top of the frame memory and top of the display device are aligned.

TFA, VSA and BFA refer to the Frame Memory Line Pointer.

	 <p>The diagram illustrates the memory layout for the display device. It shows a grid of horizontal lines. The origin (0,0) is at the top-left corner. The grid is divided into three main vertical sections: a shaded 'Bottom Fixed Area' at the top, a central 'VSA' (Vertical Scroll Area) indicated by a bracket, and a shaded 'Top Fixed Area' at the bottom. Arrows indicate the bit ranges for BFA[15:0] (pointing to the bottom of the Bottom Fixed Area), VSA[8:0] (pointing to the VSA area), and TFA[15:0] (pointing to the top of the Top Fixed Area). An arrow on the right points to the first line of the VSA area, labeled 'First line read from memory'.</p>																
<p>Restriction</p>	<p>The sum of TFA, VSA and BFA must equal the number of the display device's horizontal lines (pages), otherwise Scrolling mode is undefined. In Vertical Scroll Mode, set_address_mode B5 should be set to '0' – this only affects the Frame Memory Write.</p>

Flow Chart	<p>The flow chart illustrates the sequence of operations for reading RDCABCMB. It is divided into two modes: Serial I/F Mode (P/SX = Low) and Parallel I/F Mode (P/SX = High). In Serial mode, a 'Read RDCABCMB' command (represented by a rectangle) leads to 'Send 2nd Parameter' (represented by a parallelogram). In Parallel mode, a 'Read RDCABCMB' command leads to 'Dummy Read' (represented by a parallelogram) which is shown to both Host and Display, followed by 'Send 2nd Parameter' (represented by a parallelogram). A legend on the right defines the symbols: Command (rectangle), Parameter (parallelogram), Display (oval), Action (arrowhead), Mode (rounded rectangle), and Sequential transfer (dashed line).</p>																								

8.2.45. Read First Checksum (AAh)

9. Display Data RAM

9.1. Configuration

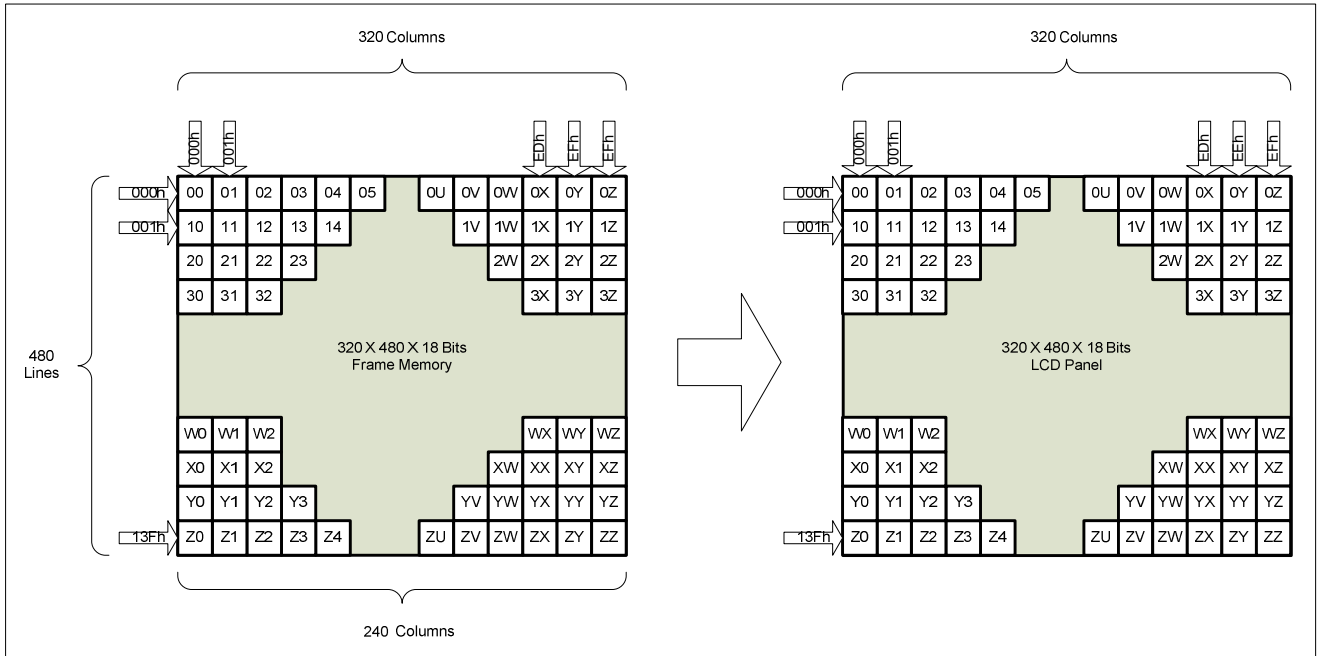

The display data RAM stores display dots and consists of 345,600 bits (320x480x18 bits). There is no restriction on access to the RAM even when the display data on the same address is loaded to DAC. There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

9.2. Memory to Display Address Mapping

In this mode, the content of the frame memory within an area where column pointer is 0000h to 013Fh and page pointer is 0000h to 01DFh is displayed.

To display a dot on leftmost top corner, store the dot data at (column pointer, page pointer) = (0,0)

9.3. MCU to memory write/read direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by “Memory Data Access Control” Command, Bits B5, B6, and B7 as described below.

B5	B6	B7	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (479-Physical Page Pointer)
0	1	0	Direct to (319-Physical Column Pointer)	Direct to Physical Page Pointer
0	1	1	Direct to (319-Physical Column Pointer)	Direct to (479-Physical Page Pointer)
1	0	0	Direct to Physical Page Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (479-Physical Page Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Page Pointer	Direct to (319-Physical Column Pointer)
1	1	1	Direct to (479-Physical Page Pointer)	Direct to (319-Physical Column Pointer)

Condition	Column Counter	Page counter
When RAMWR/RAMRD command is accepted	Return to "Start column"	Return to "Start Page"
Complete Pixel Read/Write action	Increment by 1	No change
The Column values is large than "End Column"	Return to "Start column"	Increment by 1
The Page counter is large than "End Page"	Return to "Start column"	Return to "Start Page"

Note: Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7, B6 and B5.

The write order for each pixel unit is

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0

One pixel unit represents 1 column and 1 page counter value on the Frame Memory.

Display Data Direction	MADCTR Parameter			Image in the Memory (MPU)	Image in the Driver (Frame Memory)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
XY Exchange X-Mirror	1	1	0		
XY Exchange X-YMirror	1	1	1		

10. Tearing Effect Information

The Tearing Effect output supplies to the MCU a Panel synchronization information (= Tearing Effect Information) which is telling the position of the refreshing on the display panel, to the MCU which can decide when it can send image information to ILI9486 (Mainly used for a moving image e.g. video clips) that there can avoid the abnormal visual effect on the display panel of ILI9486.

This information can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect Signal is defined by the parameter of the Tearing Effect Line Off & On commands.

This Tearing Effect information can be sent in two different ways:

- Separated Line, which is so-called Tearing Effect (TE) line.
- Bus, which is so-called Tearing Effect (TEE) Bus Trigger, when ILI9486 is sending a trigger to the MCU.

The TE line is used in MCU parallel interface. The TE line can also be used in DSI case if the tearing Effect (TEE) Bus Trigger is not possible to use. The Tearing Effect (TEE) Bus Trigger is only used in DSI case.

10.1. Tearing Effect Line

10.1.1. Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Sync information only:

tvdh = The LCD display is not updated from the Frame Memory.

tvdl = The LCD display is updated from the Frame Memory (except Invisible Line – see below).

Mode 2, the tearing effect output signal consists of V-Sync and H-Sync information; there is one V-sync and 480 H-sync pulses per field:

thdh = The LCD display is not updated from the Frame Memory.

thdl = The LCD display is updated from the Frame Memory (except Invisible Line – see above).

Note: During Sleep In Mode, the Tearing Effect Output Pin is active Low.

10.1.2. Tearing Effect Line Timing

The tearing effect signal is described below:

AC characteristics of Tearing Effect Signal (Frame Rate = 60.5Hz)

Symbol	Parameter	Min.	Max.	Unit	Description
t_{vdl}	Vertical timing low duration	TBD	TBD	ms	
t_{vdh}	Vertical timing high duration	1000	TBD	us	
t_{hdl}	Horizontal timing low duration	TBD	TBD	us	
t_{hdh}	Horizontal timing high duration	TBD	500	us	

Notes: 1. The timings in Table as above apply when MADCTL B4=0 and B4=1

2. Minimum frequency of the TE-line can not be less than 25Hz when the TE-line is active on Mode 1.

3. The signal's rise and fall times (t_r , t_f) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MCU and should be used to avoid Tearing Effect.

10.2. Tearing Effect Bus Trigger

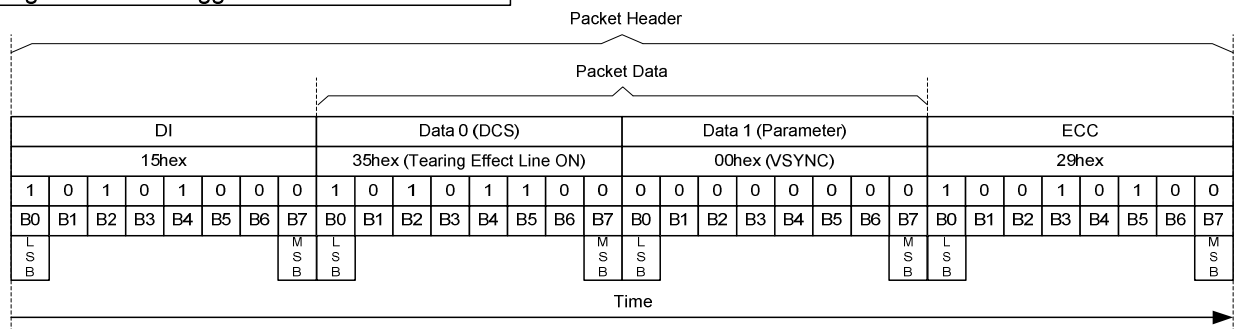

Tearing Effect Bus Trigger information supplies to the MCU a Panel synchronization trigger and this Tearing Effect Bus Trigger information can be enabled or disabled by “Tearing Effect Line Off (34h)” and “Tearing Effect Line On (35h)” commands when the only mode of the Tearing Effect Signal is VSYNC information.

The ILI9486 is sending this trigger information in Escape Mode after the Bus Turnaround (BTA) and the Tearing Effect Bus Trigger can only use in DSI case without the TE line.

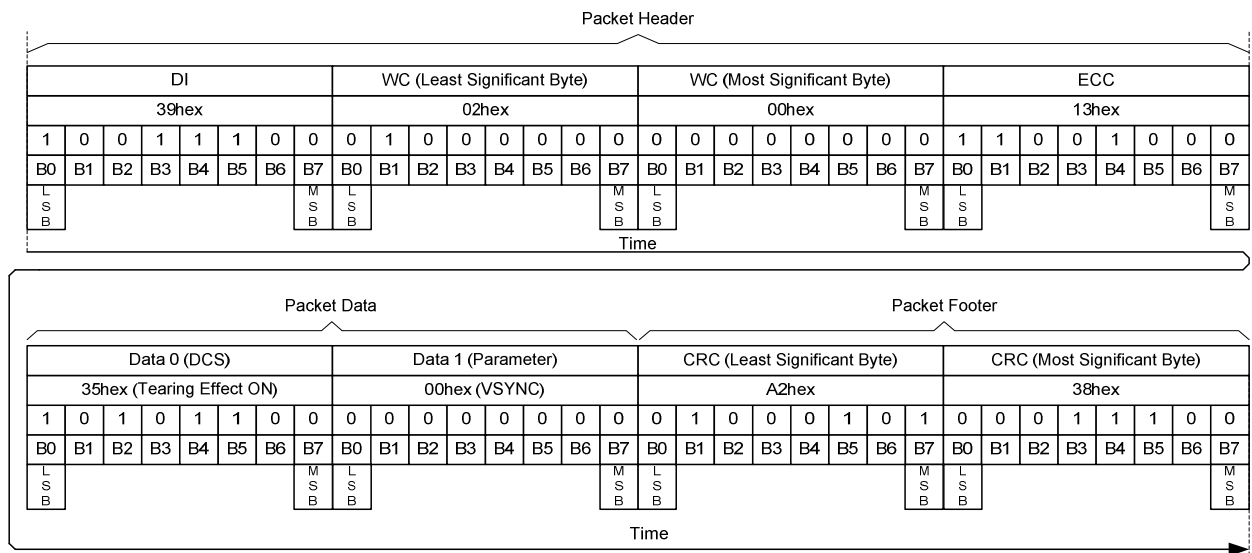

10.2.1. Tearing Effect Bus Trigger Enable

The MCU can enable the Tearing Effect Bus Trigger on ILI9486 in 2 different ways when a Short Packet (SPa) or Long Packet (LPa) is used. These cases are illustrated below.

Tearing Effect Bus Trigger Enable - Short Packet

Tearing Effect Bus Trigger Enable - Long Packet

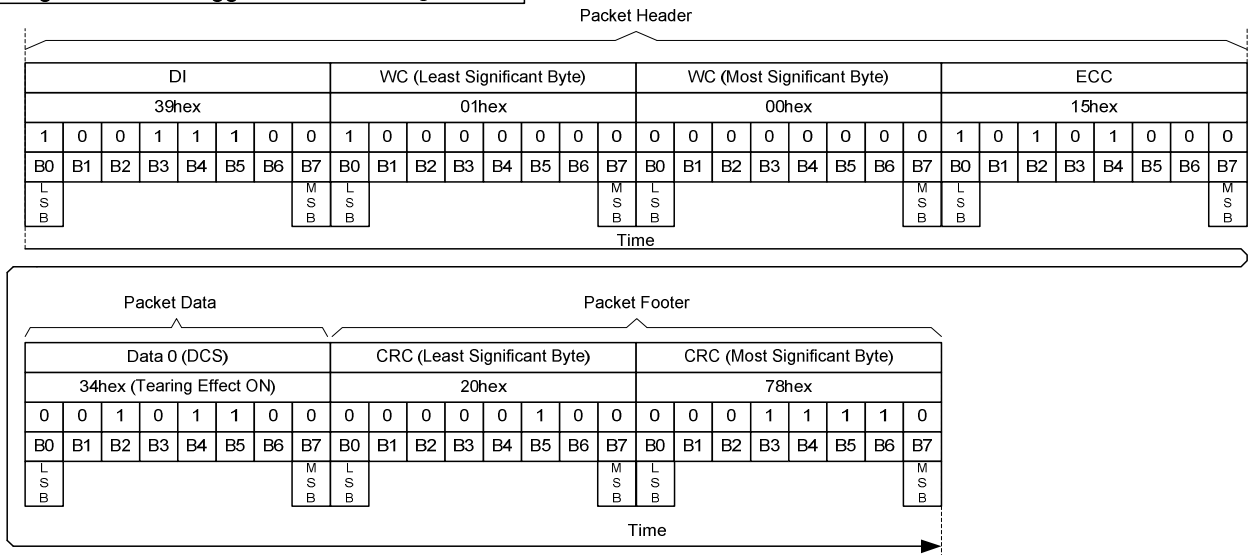

10.2.2. Tearing Effect Bus Trigger Disable

The MCU can enable the Tearing Effect Bus Trigger on ILI9486 in 2 different ways when a Short Packet (SPa) or Long Packet (LPa) is used. These both possibilities are illustrated below.

Tearing Effect Bus Trigger Disable - Short Packet

Tearing Effect Bus Trigger Disable - Long Packet

10.2.3. Tearing Effect Bus Trigger Sequences

Tearing Effect Bus Trigger Enable Sequence – DCS Write (Long Packet) and HSDT

11. Sleep Out – Command and Self-Diagnostic Functions of ILI9486

11.1. Register loading Detection

Sleep Out-command (Command “Sleep Out (11h)”) is a trigger for an internal function of ILI9486, which indicates, if ILI9486 loading function of factory default values from EEPROM (or similar device) to registers of the display controller is working properly.

There are compared factory values of the EEPROM and register values of the display controller by the display controller (1st step: compares register and EEPROM values, 2nd step: loads EEPROM values to registers). If those both values (EEPROM and register values) are same, there is inverted (= increased by 1) a bit, which is defined in command “Read Display Self-Diagnostic Result (0Fh)” (= RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= not increased by 1).

The flow chart for this internal function is following:

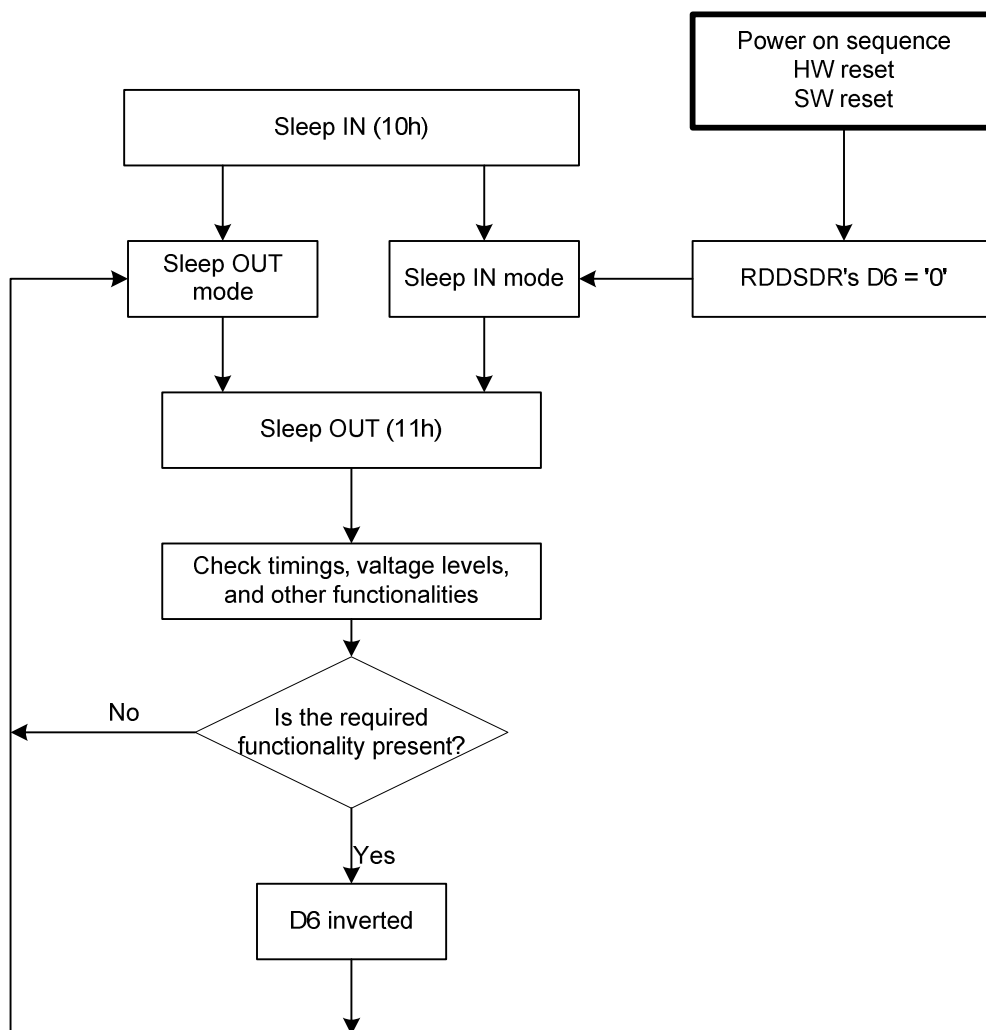

Note 1: There is not compared and loaded register values, which can be changed by User (User area commands: 00h to AFh and DAh to DDh), by ILI9486.

11.2. Functionality Detection

Sleep Out-command (Command “Sleep Out (11h)”) is a trigger for an internal function of ILI9486, which indicates, if ILI9486 is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if ILI9486 is still meeting functionality requirements (e.g. booster voltage levels, timings, etc.) If functionality requirement is met, there is an inverted (= increased by 1) bit, which defined in command “Read Display Self- Diagnostic Result (0Fh)” (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1). The flow chart for this internal function is shown as below.

The flow chart for this internal function is following:

Note 1: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In -mode to Sleep Out -mode, before there is possible to check if User's functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out -command is sent in Sleep Out -mode.

12. Power ON/OFF Sequence

IOVCC and VCI can be applied in any order. VCI and IOVCC can be powered down in any order. During power off, if LCD is in the Sleep Out mode, VCI and IOVCC must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, IOVCC or VCI can be powered down minimum 0msec after RESX has been released.

Note 1: There will be no damage to ILI9486 if the power sequences are not met.

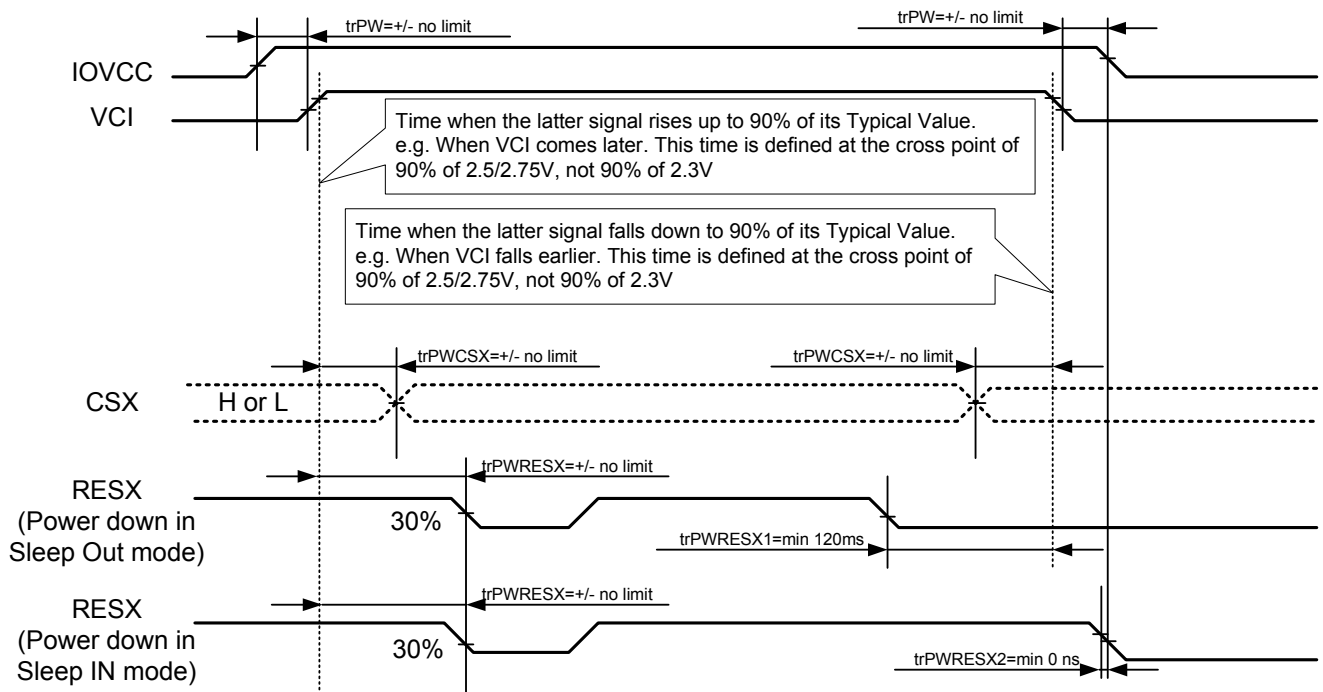

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

Note 4: If RESX line is not held stable by host during Power On Sequence as defined in Sections 12.1 and 12.2, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

12.1. Case 1 – RESX line is held High or Unstable by Host at Power ON

If RESX line is held High or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

trPWRESX1 is applied to RESX falling in the Sleep Out Mode
trPWRESX2 is applied to RESX falling in the Sleep In Mode

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal power level.

12.2. Case 2 – RESX line is held Low by Host at Power ON

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum

10μsec after both VCI and IOVCC have been applied.

trPWRESX1 is applied to RESX falling in the Sleep Out Mode
trPWRESX2 is applied to RESX falling in the Sleep In Mode

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal power level.

12.3. Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for ILI9486 or ILI9486 will not cause any damages for the host or lines of the interface. At an uncontrolled power off event, ILI9486 will force the display to blank and will not be any abnormal visible effects with in 1 second on the display and remains blank until "Power On Sequence" powers it up.

13. Power Level Definition

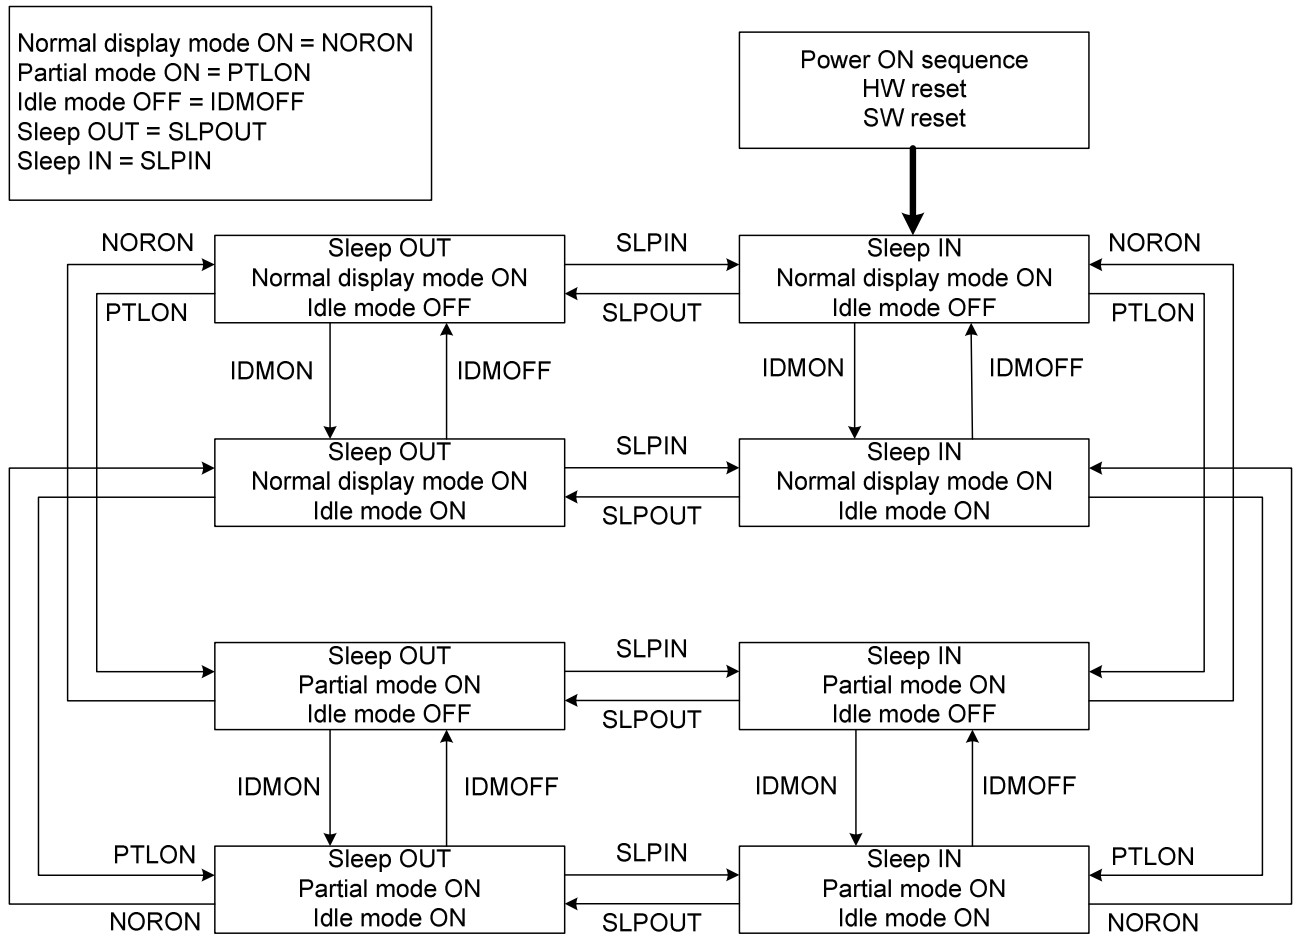

13.1. Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.
In this mode, the display is able to show maximum 262,144 colors.
2. Partial Mode On, Idle Mode Off, Sleep Out.
In this mode part of the display is used with maximum 262,144 colors.
3. Normal Mode On (full display), Idle Mode On, Sleep Out.
In this mode, the full display area is used but with 8 colors.
4. Partial Mode On, Idle Mode On, Sleep Out.
In this mode, part of the display is used but with 8 colors.
5. Sleep In Mode.
In this mode, the DC:DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with IOVCC power supply. Contents of the memory are safe.
6. Power Off Mode.
In this mode, both VCI and IOVCC are removed.

Note1: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

13.2. Power Flow Chart

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by User, when there is changing from one power mode to another power mode.

13.3. LCM Voltage Generation

14. Reset

14.1. Registers

The registers that are initialized are listed as below:

Register	After Powered ON	After Hardware Reset	After Software Reset
Frame Memory	Random	Random	Random
Sleep	In	In	In
Display Mode	Normal	Normal	Normal
Display Status	Display Off	Display Off	Display Off
Idle Mode	Off	Off	Off
Column Start Address	0000 h	0000 h	0000 h
Column End Address	013F h	013F h	013F h
Page Start Address	0000 h	0000 h	0000 h
Page End Address	01F h	013F h	013F h
Gamma Setting	GC0	GC0	GC0
Partial Area Start	0000 h	0000 h	0000 h
Partial Area End	01DF h	01DF h	01DF h
Memory Data Access Control	00 h	00 h	00h
RDNUMED	00 h	00 h	00h
RDDPM	08 h	08 h	08 h
RDDMADCTL	00 h	00 h	00 h
RDDCOLMOD	07 h	07 h	07 h
RDDIM	00 h	00 h	00 h
RDDSM	00 h	00 h	00 h
RDDSDR	00 h	00 h	00 h
RDDISBV	00 h	00 h	00 h
RDCTRLD	00 h	00 h	00 h
RDCABC	00 h	00 h	00 h
RDCABCMB	00 h	00 h	00 h
TE Output Line	Off	Off	Off
TE Line Mode	Mode 1 (Note 3)	Mode 1 (Note 3)	Mode 1 (Note 3)

Note 1: There will be no abnormal visible effects on the display when S/W or H/W Resets are applied.

Note 2: After Powered-On Reset finishes within 10 μ s after both VCI & IOVCC are applied.

Note 3: Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

14.2. Output Pins, I/O Pins

	After Power ON	After Hardware Reset	After Software Reset
TE line	Low	Low	Low
DB[17:0] (output driver), SDA	Hi-Z (Inactive)	Hi-Z (Inactive)	Hi-Z (Inactive)

Note 1: There will be no output from DB[17:0] during Power ON/OFF sequence, hardware reset and software reset.

14.3. Input Pins

	During Power ON Process	After Power ON	After Hardware Reset	After Software Reset	During Power OFF Process
RESX	See Chapter 12	Input valid	Input valid	Input valid	See Chapter 12
CSX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D/CX	Input invalid	Input valid	Input valid	Input valid	Input invalid
WRX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RDX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RWX	Input invalid	Input valid	Input valid	Input valid	Input invalid
SCL	Input invalid	Input valid	Input valid	Input valid	Input invalid
DB[17:0] (input driver), SDA	Input invalid	Input valid	Input valid	Input valid	Input invalid

14.4. Reset Timing

Signal	Symbol	Parameter	Min	Max	Unit
RESX	tRW	Reset pulse duration	10		uS
	tRT	Reset cancel		5 (note 1,5)	mS
				120 (note 1,6,7)	mS

Note 1: The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from EEPROM to registers. This loading is done every time when there is HW reset cancel time (tRT) within 5 ms after a rising edge of RESX.

Note 2: Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 9us	Reset
Between 5us and 9us	Reset starts

Note 3: During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.

Note 4: Spike Rejection also applies during a valid reset pulse as shown below:

Note 5: When Reset applied during Sleep In Mode.

Note 6: When Reset applied during Sleep Out Mode.

Note7: It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

15. NV Memory Programming Flow

16. Gamma Correction

TBD

17. Electrical Characteristics

17.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When ILI9486 is used out of the absolute maximum ratings, the ILI9486 may be permanently damaged. To use the ILI9486 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the ILI9486 will malfunction and cause poor reliability.

Item	Symbol	Unit	Value
Supply voltage	VCI	V	-0.3 ~ +5.0
Supply voltage (Logic)	IOVCC	V	-0.3 ~ +4.6
Supply voltage (Digital)	VCORE	V	-0.3 ~ +2.4
Driver supply voltage	VGH-VGL	V	-0.3 ~ +33.0
Logic input voltage range	VIN	V	-0.3 ~ IOVCC + 0.3
Logic output voltage range	VOUT	V	-0.3 ~ IOVCC + 0.3
Operating temperature	Topr	°C	-40 ~ +85
Storage temperature	Tstg	°C	-55 ~ +110

Notes: If the absolute maximum rating of even is one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

17.2. DC Characteristics

DSI is using different state codes which are depending on DC voltage levels of the clock and data lanes. The meaning of the state codes is defined on the following table.

State Code	Line DC Voltage Levels	
	CLOCK_P or DATA_N	CLOCK_N or DATA_P
HS-0	Low (HS)	High (HS)
HS-1	High (HS)	Low (HS)
LP-00	Low (LP)	Low (LP)
LP-01	Low (LP)	High (LP)
LP-10	High (LP)	Low (LP)
LP-11	High (LP)	Low (LP)

Note: $T_a = -30^{\circ}\text{C}$ to 70°C (to $+85^{\circ}\text{C}$ no damage)

17.2.1. DC characteristics for Power Lines

Parameter	Symbol	Condition	Specification			Unit
			Min.	Typ.	Max.	
Analog power supply voltage	V_{CI}	Operating voltage	2.5	3.7	4.8	V
Digital power supply voltage	V_{IOVCC}	I/O supply voltage	1.65	1.8	1.95	V
Analog power supply voltage noise	V_{CI_NOISE}	Noise window, 0 to 100MHz	-	-	500	mV
Digital power supply voltage noise	V_{IOVCC_NOISE}	Noise window, 0 to 100MHz	-	-	500	mV

Note 1: $T_a = -30^{\circ}\text{C}$ to 70°C (to $+85^{\circ}\text{C}$ no damage)

Note 2: These values are not symmetric amplitude, which centre points are IOVCC or VCI. See examples as reference purposes, when V_{CI_NOISE} and $IOVCC_NOISE$ are maximums, below.

17.2.2. DC characteristics for DSI LP mode

DC levels of the LP-00, LP-01, LP-10 and LP-11 are defined on table below: DC Characteristics for DSI LP mode when LP-RX, LP-CD or LP-TX is mentioned on the condition column. Other logical levels of the table are for MCU interface.

Parameter	Symbol	Condition	Specification			Unit
Logic High level output voltage	V_{OH}	$I_{OUT}=-1mA$; Note 2	$0.8 V_{IOVCC}$	-	V_{IOVCC}	V
Logic Low level output voltage	V_{OL}	$I_{OUT}=-1mA$; Note 2	0.0	-	$0.2V_{IOVCC}$	V
Logic High level input voltage	V_{IHLPCD}	LP-CD ; Note 3	450	-	1350	mV
Logic Low level input voltage	V_{ILLPCD}	LP-CD ; Note 3	0.0	-	200	mV
Logic High level input voltage	V_{IHLPRX}	LP-RX (CLOCK, DATA) ; Note 3	880	-	1350	mV
Logic Low level input voltage	V_{ILLPRX}	LP-RX (CLOCK, DATA) ; Note 3	0.0	-	550	mV
Logic Low level input voltage	$V_{ILLPRXULP}$	LP-RX (CLOCK ULP mode), Note 3	0.0	-	300	mV
Logic high level output voltage	V_{OHLPTX}	LP-TX (DATA), Note 3	1.1	-	1.3	V
Logic Low level output voltage	V_{OLLPTX}	LP-TX (DATA), Note 3	-50	-	50	mV
Logic High level input current	I_{IH}	LP-CD, LP-RX, Note 3	-	-	10	uA
Logic Low level input current	I_{IL}	LP-CD, LP-RX, Note 3	-10	-	-	uA

Note: (1) $T_a=-30^{\circ}C$ to $70^{\circ}C$ (to $+85^{\circ}C$ no damage)

(2) PWM_OUT, TE

(3) DSI High Speed mode is off

17.2.3. Spike / Glitch Rejection

Spike / Glitch Rejection - DSI					
Signal	Symbol	Parameter	Min	Max	Unit
Input (DSI-CLOCK P/N, DSI-CLOCK P/N)	SGD	Input pulse rejection for DSI	--	300	Vps

17.2.4. DC Characteristics for DSI HS mode

DC levels of the HS-0 and HS-0 are defined on table below: DC Characteristics for DSI HS mode.

Parameter	Symbol	Condition	Specification			Unit
Input Common Mode Voltage for Clock	V_{CMCLK}	DSI-CLOCK_P/N ; Note 2,3	70	-	330	mV
Input Common Mode Voltage for Data	V_{CMDATA}	DSI-DATA_P/N ; Note 2,3	70	-	330	mV
Common Mode Ripple for Clock Equal or Less than 450MHz	$V_{CMRCLKL450}$	DSI-CLOCK_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Data Equal or Less than 450MHz	$V_{CMRDATAL450}$	DSI-DATA_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Clock More than 450MHz (peak sine wave)	$V_{CMRCLKM450}$	DSI-CLOCK_P/N	-	-	100	mV
Common Mode Ripple for Data More than 450MHz (peak sine wave)	$V_{CMRDATAM450}$	DSI-DATA_P/N	-	-	100	mV
Differential Input Low Level Threshold Voltage for Clock	$V_{THLCLK-}$	DSI-CLOCK_P/N	-70	-	-	mV
Differential Input Low Level Threshold Voltage for Data	$V_{THLDATA-}$	DSI-DATA_P/N	-70	-	-	mV
Differential Input High Level Threshold Voltage for Clock	$V_{THHCLK+}$	DSI-CLOCK_P/N	-	-	70	mV
Differential Input High Level Threshold Voltage for Data	$V_{THHDATA+}$	DSI-DATA_P/N	-	-	70	mV
Single-ended Input Low Voltage	V_{ILHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-40	-	-	mV
Single-ended Input High Voltage	V_{IHHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-	-	460	mV
Differential Termination Resistor	R_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	80	100	125	Ω
Single-ended Threshold Voltage for Termination Enable	$V_{TERM-EN}$	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	450	mV
Termination Capacitor	C_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	14	pF

Note: (1) $T_a = -30$ to 70 °C (to $+85$ °C no damage), $IOVCC = 1.65$ to $1.95V$, $GND = 0V$

(2) Includes $50mV$ ($-50mV$ to $50mV$) ground difference

(3) Without $V_{CMRCLKM450}/V_{CMRDATAM450}$

(4) Without $50mV$ ($-50mV$ to $50mV$) ground difference

The DSI receiver (HS mode) is understanding that there is logical '1' (HS-1) when a differential voltage is more than V_{THH} (CLK+/DATA+) and the DSI receiver (HS mode) is understanding that there is logical '0' (HS-0) when a differential voltage is more than V_{THL} (CLK-/DATA-). There is undefined state if the differential voltage is less than V_{THH} (CLK+/DATA+) and less than V_{THL} (CLK-/DATA-). A reference figure is below.

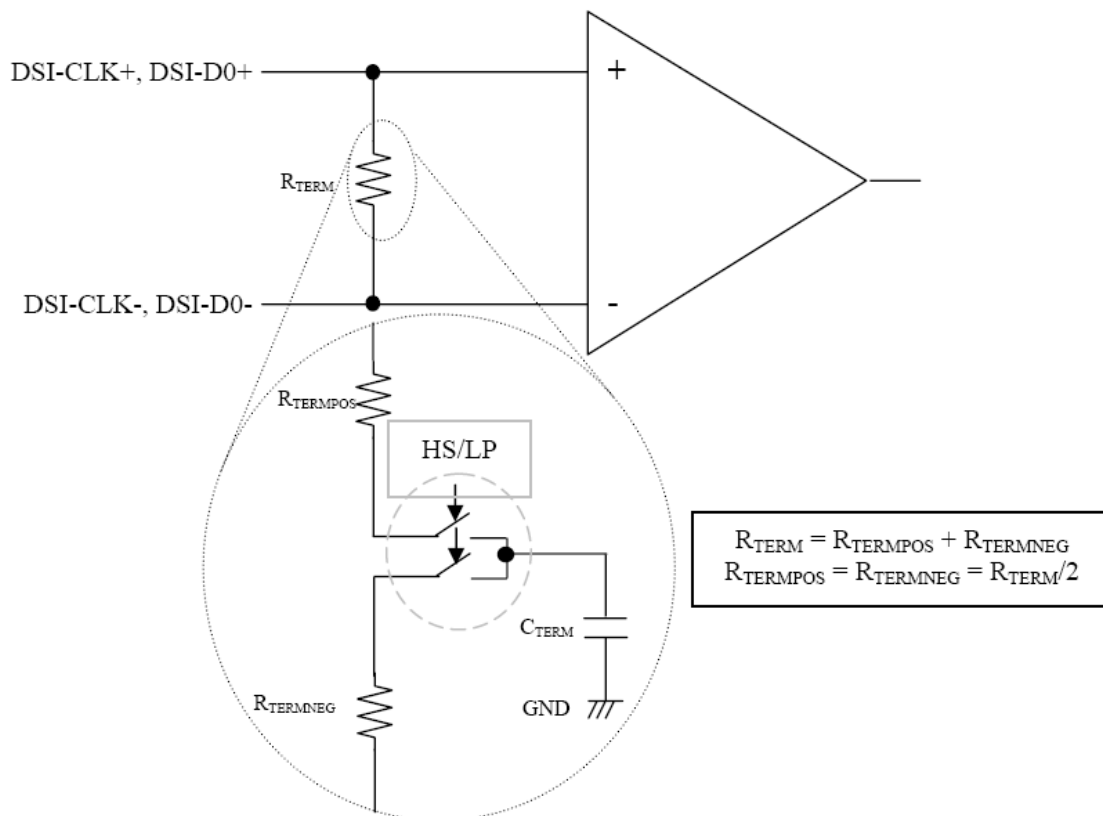

The termination resistor (R_{TERM}) of the differential DSI receiver can be driven two different states by the receiver:

- Low Power (LP) mode when the termination resistor is not connected between differential inputs DSI-CLK+ \Leftrightarrow DSI-CLK- or DSI-D0+ \Leftrightarrow DSI-D0-
- High Speed (HS) mode when the termination resistor is connected between differential inputs (DSI-CLK+ \Leftrightarrow DSI-CLK- or DSI-D0+ \Leftrightarrow DSI-D0-)

The termination switch (HS/LP), when the termination resistor is not connected, is illustrated below.

17.2.5. DC Characteristics for Panel Driving

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Note
Power & Operation Voltage							
Analog operating voltage	VCI	-	2.5	2.8	3.6	V	
Logic operating voltage	IOVCC	-	1.65	2.8	3.6	V	
Digital operating voltage	VCORE	Digital block power supply	-	1.5	-	V	Note2
Gate Driver High Voltage	VGH	-	10.0	-	16.0	V	Note3
Gate Driver Low Voltage	VGL	-	-16.0	-	-9.0	V	Note3
Driver Supply Voltage	-	VGH-VGL	19	-	32	V	Note3
VCOM Operation							
VCOM Amplitude Voltage	VCOM	-	0	-	-2.0	V	Note3
Source Driver							
Source Output Range	Vsout	-	0.1	-	VREG1OUT-0.1	V	Note4
Positive Gamma Reference Voltage	VREG1OUT	-	3.6	-	5.5	V	Note3
Negative Gamma Reference Voltage	VREG2OUT	-	-5.5	-	-3.6	V	Note3
Source Output Setting Time	Tr	Below with 99% precision	-	15	20	uS	Note4,5
Output Deviation Voltage (Source Output channel)	Vdev	Sout>=4.2V	-	-	20	mV	Note4
		Sout<=0.8V	-	-	15	mV	-
Output Offset Voltage	VOFSET	-	-	-	35	mV	Note6
Booster Operation							
1 st Booster (VCI1x2) Voltage	DDVDH	-	4.5	-	6.0	V	Note3
1 st Booster (VCI1x2) Voltage	DDVDL	-	-6.0	-	-4.5	V	Note3
1 st Booster (VCI1x2 Drop Voltage	VCI1x2 drop	loading=1mA	-	-	5	%	Note3
Liner Range	Vliner	-	0.2	-	DDVDH-0.2	V	

Note 1: IOVCC=1.65 to 3.6V, VCI=2.5 to 3.6V, AGND=DGND=0V, Ta=-30 to 70 (to +85 no damage) °C.

Note2: Please supply digital IOVCC voltage equal or less than analog VCI voltage.

Note2, 3, 4: When the measurements are performed with LCD module. Measurement Points are like below.

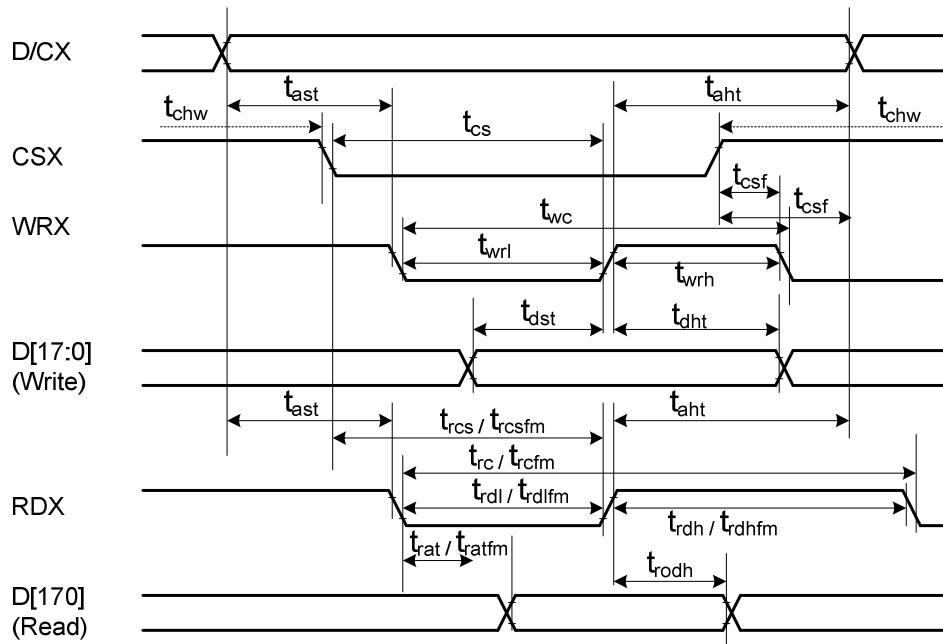

Note3: CSX, RDX, WRX, DB[17:0], D/CX, RESX, TE, SDA, SCL, IM2, IM1, IM0, and Test pins.

Note5: Source channel loading = 10pF/channel, Gate channel loading = 50pF/channel

Note6: The Max. Value is between with Note 4 measure point and Gamma setting value

17.3. AC Characteristics

17.3.1. Display Parallel 18/16/9/8-bit Interface Timing Characteristics (8080-series)

Signal	Symbol	Parameter	min	max	Unit	Description
DCX	t _{ast}	Address setup time	0	-	ns	-
	t _{ah}	Address hold time (Write/Read)	0	-	ns	-
CSX	t _{chw}	CSX "H" pulse width	0	-	ns	-
	t _{cs}	Chip Select setup time (Write)	15	-	ns	-
	t _{r_{cs}}	Chip Select setup time (Read ID)	45	-	ns	-
	t _{r_{csfm}}	Chip Select setup time (Read FM)	355	-	ns	-
	t _{csf}	Chip Select Wait time (Write/Read)	0	-	ns	-
WRX	t _{wc}	Write cycle	66	-	ns	-
	t _{wrh}	Write Control pulse H duration	15	-	ns	-
	t _{wrl}	Write Control pulse L duration	15	-	ns	-
RDX (FM)	t _{r_{cfm}}	Read Cycle (FM)	450	-	ns	When read from Frame Memory
	t _{r_{dhfm}}	Read Control H duration (FM)	90	-	ns	
	t _{r_{dlfm}}	Read Control L duration (FM)	355	-	ns	
RDX (ID)	t _{rc}	Read cycle (ID)	160	-	ns	When read ID data
	t _{r_{dh}}	Read Control pulse H duration	90	-	ns	
	t _{r_{dl}}	Read Control pulse L duration	45	-	ns	
DB[17:0], DB[15:0], DB[8:0] DB[7:0]	t _{dst}	Write data setup time	10	-	ns	For maximum CL=30pF For minimum CL=8pF
	t _{dht}	Write data hold time	10	-	ns	
	t _{rat}	Read access time	-	40	ns	
	t _{ratfm}	Read access time	-	340	ns	
	t _{rod}	Read output disable time	20	80	ns	

Note: (1) $T_a = -30$ to 70 °C, $I_{OVCC} = 1.65V$ to $3.6V$, $V_{CI} = 2.5V$ to $3.6V$, $AGND = DGND = 0V$

(2) Logic high and low levels are specified as 30% and 70% of IOVCC for input signals.

(3) Logic high and low levels are specified as 30% and 70% of IOVCC for input signals.

17.3.2. Display Serial Interface Timing Characteristics (3-line SPI system)

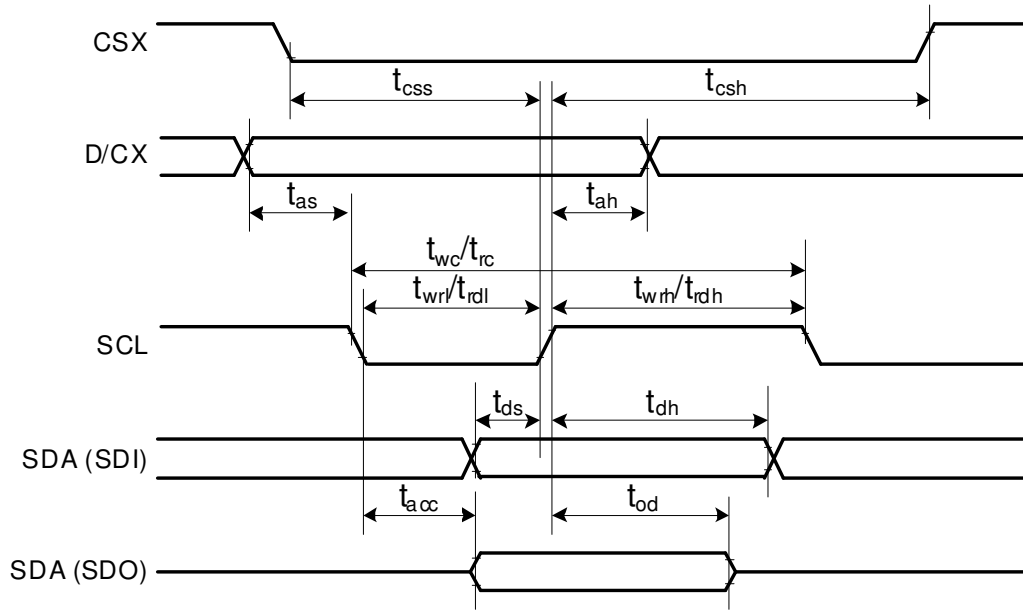

Signal	Symbol	Parameter	min	max	Unit	Description
SCL	tscycw	Serial Clock Cycle (Write)	66	-	ns	
	tshw	SCL "H" Pulse Width (Write)	15	-	ns	
	tslw	SCL "L" Pulse Width (Write)	15	-	ns	
	tscycr	Serial Clock Cycle (Read)	150	-	ns	
	tshr	SCL "H" Pulse Width (Read)	60	-	ns	
	tslr	SCL "L" Pulse Width (Read)	60	-	ns	
SDA / SDI (Input)	tsds	Data setup time (Write)	10	-	ns	
	tsdh	Data hold time (Write)	10	-	ns	
SDA / SDO (Output)	tacc	Access time (Read)	10	50	ns	
	toh	Output disable time (Read)	15	50	ns	
CSX	tsc	SCL-CSX	15	-	ns	
	tch	CSX "H" Pulse Width	40	-	ns	
	tcs	CSX-SCL Time	60	-	ns	
	tcs		65	-	ns	

Note: $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.6V$, $AGND=DGND=0V$, $T=10\pm 0.5ns$

17.3.3. Display Serial Interface Timing Characteristics (4-line SPI system)

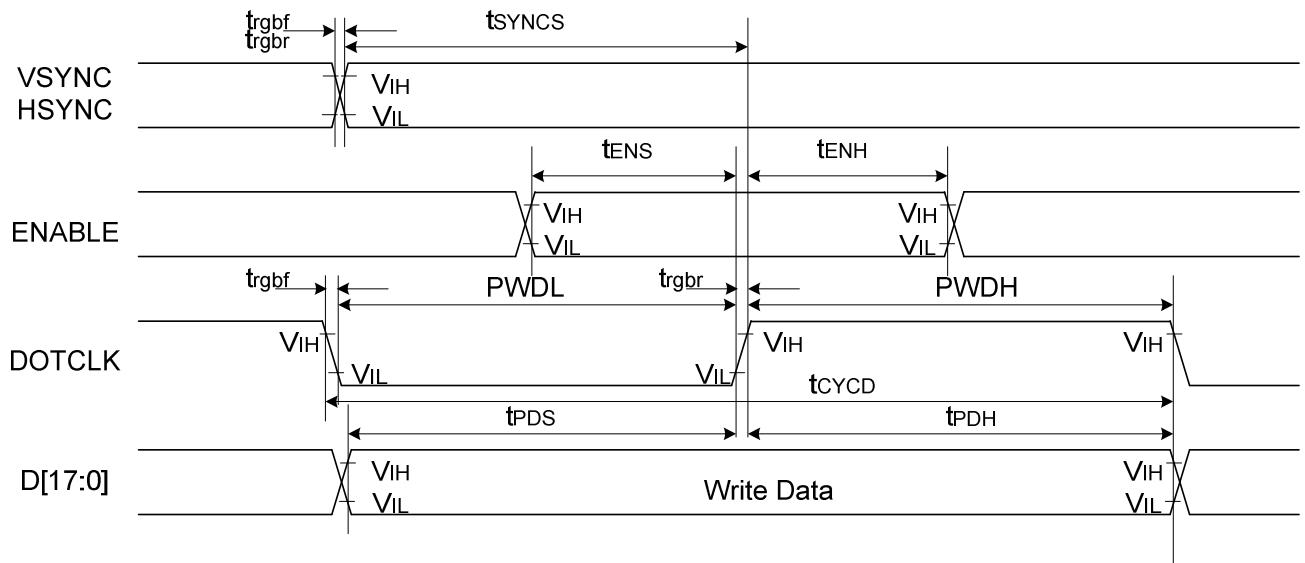

Signal	Symbol	Parameter	min	max	Unit	Description
CSX	t_{css}	Chip select time (Write)	15	-	ns	
	t_{csh}	Chip select hold time (Read)	60	-	ns	
SCL	t_{wc}	Serial clock cycle (Write)	66	-	ns	
	t_{wrh}	SCL "H" pulse width (Write)	15	-	ns	
	t_{wrl}	SCL "L" pulse width (Write)	15	-	ns	
	t_{rc}	Serial clock cycle (Read)	150	-	ns	
	t_{rdh}	SCL "H" pulse width (Read)	60	-	ns	
	t_{rdl}	SCL "L" pulse width (Read)	60	-	ns	
D/CX	t_{as}	D/CX setup time	10	-	ns	
	t_{ah}	D/CX hold time (Write / Read)	10	-	ns	
SDA / SDI (Input)	t_{ds}	Data setup time (Write)	10	-	ns	
	t_{dh}	Data hold time (Write)	10	-	ns	
SDA / SDO (Output)	t_{acc}	Access time (Read)	10	50	ns	For maximum $C_L=30\text{pF}$
	t_{od}	Output disable time (Read)	15	50	ns	For minimum $C_L=8\text{pF}$

Note: (1) $T_a = -30$ to 70 °C, $IOVCC=1.65\text{V}$ to 3.6V , $VCI=2.5\text{V}$ to 3.6V , $AGND=DGND=0\text{V}$, $T=10\pm 0.5\text{ns}$.

(2) Does not include signal rise and fall times.

17.3.4. Parallel 18/16-bit RGB Interface Timing Characteristics

Signal	Symbol	Parameter	min	max	Unit	Description
VSYNC / HSYNC	t_{SYNCS}	VSYNC/HSYNC setup time	15	-	ns	18/16-bit bus RGB interface mode
	t_{SYNCH}	VSYNC/HSYNC hold time	15	-	ns	
ENABLE	t_{ENS}	ENABLE setup time	15	-	ns	
	t_{ENH}	ENABLE hold time	15	-	ns	
DB[17:0]	t_{POS}	Data setup time	15	-	ns	
	t_{PDH}	Data hold time	15	-	ns	
DOTCLK	PWDH	DOTCLK high-level period	15	-	ns	
	PWDL	DOTCLK low-level period	15	-	ns	
	t_{CYCD}	DOTCLK cycle time	66	-	ns	
	t_{rgbr}, t_{rgbf}	DOTCLK, HSYNC, VSYNC rise/fall time	-	15	ns	

Note: $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.3V$, $AGND=DGND=0V$

17.3.5. MDDI Receiver Timing Characteristics

Item	Symbol	Rating			Unit	Terminals
		Min	Typ	Max		
Data transfer rate	1/t Bit	-	-	400	Mbps	MDDI_Data_P, MDDI_Data_M MDDI_Stb_P, MDDI_Stb_M
Differential Transfer Input Skew	$ \pm \text{tskew} $	-	-	0.25	nsec	MDDI_Data_P, MDDI_Data_M MDDI_Stb_P, MDDI_Stb_M
Data_Strobe Input Skew	$ \pm \text{tskew diff} $	-	-	2	nsec	MDDI_Data_P, MDDI_Data_M MDDI_Stb_P, MDDI_Stb_M

Skew between positive and negative

Skew between Data and Strobe

17.3.6. DSI

17.3.6.1. High Speed Mode – Clock Channel Timing

Signal	Symbol	Parameter	Min	Max	Unit
DSI-CLOCK_P/N	$2xUI_{INST}$	Double UI instantaneous	4	25	ns
DSI-CLOCK_P/N	UI_{INSTA}, UI_{INSTB}	UI instantaneous Half	2	12.5	ns

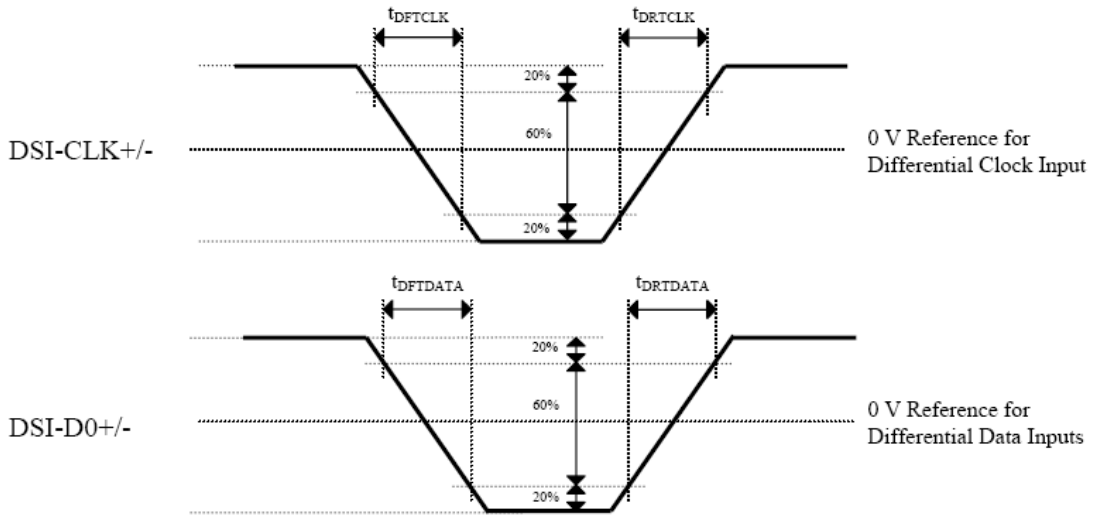

Note: $UI = UI_{INSTA} = UI_{INSTB}$

17.3.6.2. High Speed Mode – Data Clock Channel Timing

Signal	Symbol	Parameter	Min	Max	Unit
DSI-DATA_P/N	t_{DS}	Data to Clock Setup time	300	-	ps
DSI-DATA_P/N	t_{DH}	Clock to Data Hold Time	300	-	ps

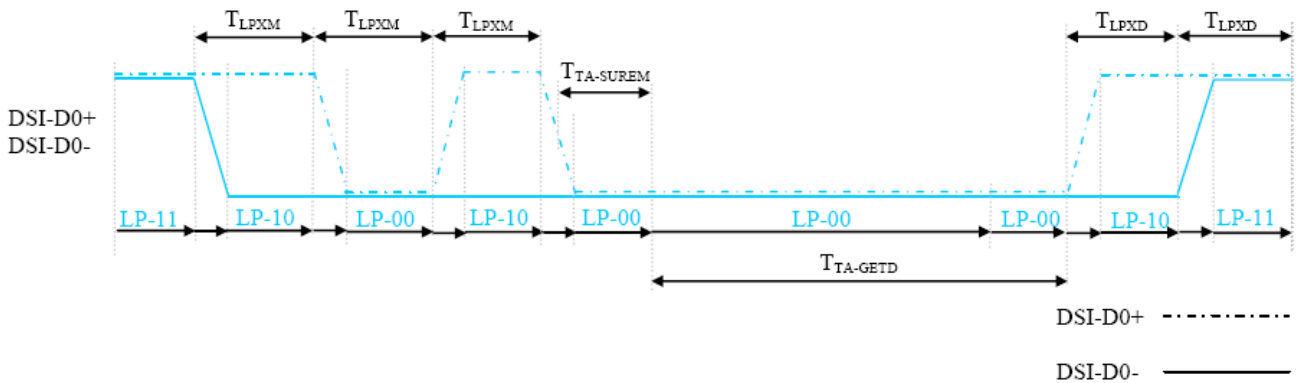

17.3.6.3. High Speed Mode – Rise and Fall Timings

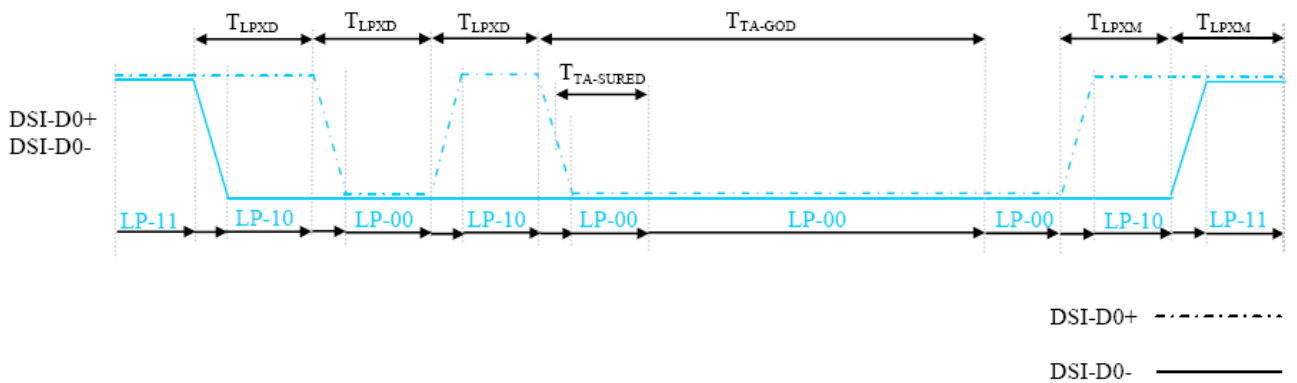

Parameter	Symbol	Condition	Specification			
			Min	Typ	Max	Unit
Differential Rise Time for Clock	t _{DRTCLK}	DSI-CLOCK_P/N	-	-	900	ps
Differential Rise Time for Data	t _{DRTDATA}	DSI-DATA_P/N	-	-	900	ps
Differential Fall Time for Clock	t _{DFTCLK}	DSI-CLOCK_P/N	-	-	900	ps
Differential Fall Time for Data	t _{DFTDATA}	DSI-DATA_P/N	-	-	900	ps

17.3.6.4. Low Speed Mode – Bus Turn Around

Lower Power Mode and its State Periods are illustrated for reference purposes on the Bus Turnaround (BTA) from the MCU to the ILI9486 sequence below.

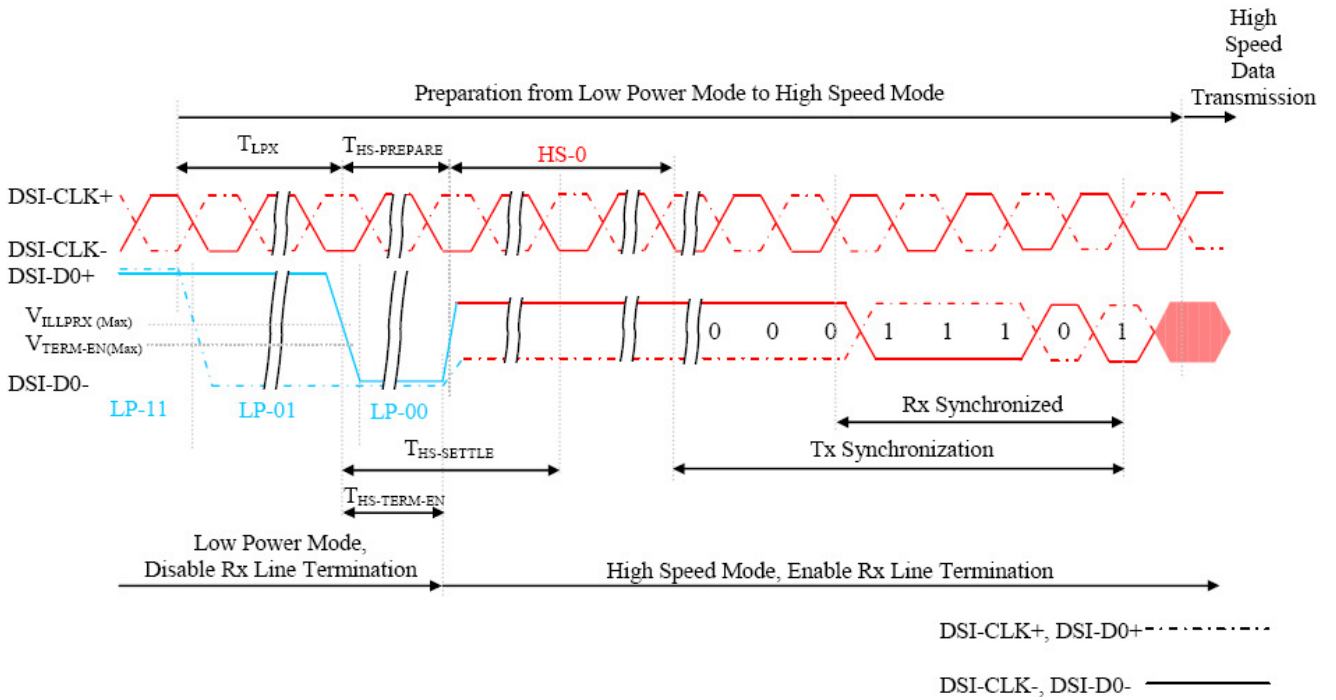

Lower Power Mode and its State Periods are illustrated for reference purposes on the Bus Turnaround (BTA) from ILI9486 to the MCU sequence below.

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	T_{LPXM}	Length of LP-00, LP-01, LP-10 or LP-11 periods MCU → ILI9486	50	-	ns
Input (DSI-DATA_P/N)	$T_{TA-SUREM}$	Time-out before the ILI9486 starts driving	T_{LPXM}	$2 \times T_{LPXM}$	ns
Output (DSI-DATA_P/N)	T_{LPXD}	Length of LP-00, LP-01, LP-10 or LP-11 periods ILI9486 → MCU	50	75	ns
Output (DSI-DATA_P/N)	$T_{TA-SURED}$	Time-out before the MCU starts driving	T_{LPXD}	$2 \times T_{LPXD}$	ns

Signal	Symbol	Description	Time	Unit
Input (DSI-DATA_P/N)	$T_{TA-GETD}$	Time to drive LP-00 by ILI9486	$5 \times T_{LPXD}$	ns
Output (DSI-DATA_P/N)	T_{TA-GOD}	Time to drive LP-00 after turnaround request - MCU	$4 \times T_{LPXD}$	ns

17.3.6.5. Data Lanes from Low Power Mode to High Speed Mode

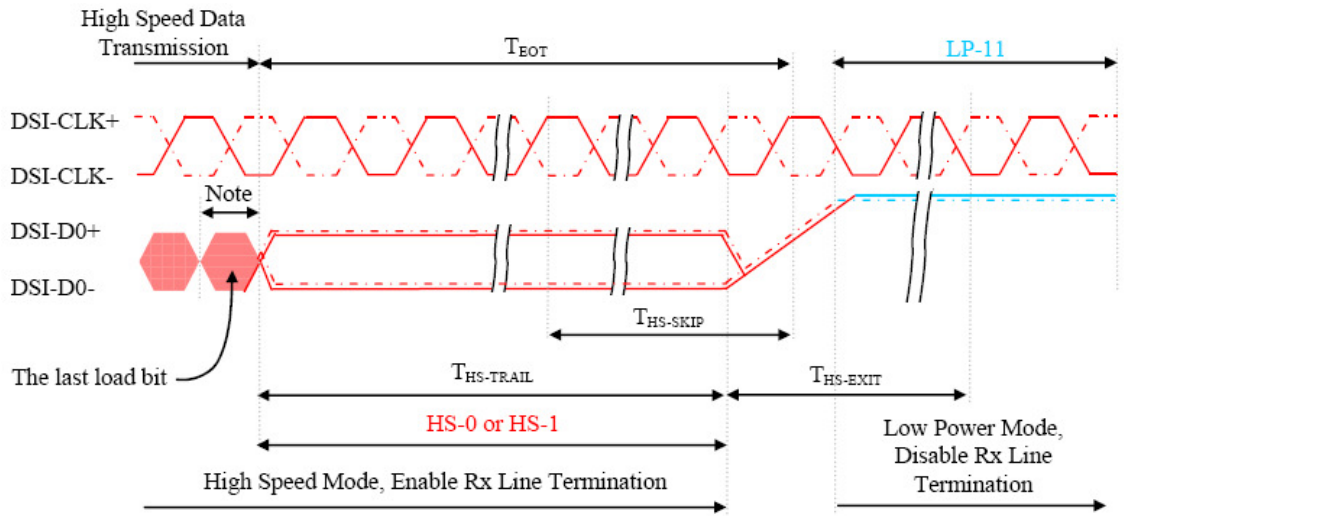

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	T_{LPX}	Length of any Low Power State Period	50	-	ns
Input (DSI-DATA_P/N)	$T_{HS-PREPARE}$	Time to Drive LP-00 to prepare for HS Transmission	$40+4xUI$	$85+6xUI$	ns
Input (DSI-DATA_P/N)	$T_{HS-TERM-EN}$	Time to enable Data Lane Receiver line termination measured from when D_n crosses V_{ILMAX}	-	$35+4xUI$	ns

Note: UI definition : $UI = UI_{INSTA} = UI_{INSTB}$

17.3.6.6. Data Lanes from High Speed Mode to Low Power Mode

Note:

If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.
If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.

DSI-CLK+, DSI-D0+ - - - - -

DSI-CLK-, DSI-D0- ———

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	$T_{HS-SKIP}$	Time-out at ILI9486 to Ignore Transition Period of EoT	40	$50+4xUI$	ns
Input (DSI-DATA_P/N)	$T_{HS-EXIT}$	Time to Driver LP-11 after HS burst	100	-	ns

17.3.6.7. DSI Clock Burst – High Speed Mode to/from Low Power Mode

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-CLOCK_P/N)	$T_{CLK-POST}$	Time that the MCU shall continue sending HS clock after the last associated Data Lanes has transitioned to LP mode	$60+52xUI$	-	ns
Input (DSI-CLOCK_P/N)	$T_{CLK-TRAIL}$	Time to drive HS differential state after last payload clock bit of a HS transmission burst	60	-	ns
Input (DSI-CLOCK_P/N)	$T_{HS-EXIT}$	Time to drive LP-11 after HS burst	100	-	ns
Input (DSI-CLOCK_P/N)	$T_{CLK-PREPARE}$	Time to drive LP-00 to prepare for HS transmission	38	95	ns
Input (DSI-CLOCK_P/N)	$T_{CLK-TERM-EN}$	Time-out at Clock Lane to enable HS termination	-	38	ns
Input (DSI-CLOCK_P/N)	$T_{CLK-PREPARE}$	Minimum lead HS-0 drive period before starting Clock	300	-	ns
Input (DSI-CLOCK_P/N)	$T_{CLK-PRE}$	Time that the HS clock shall be driven prior to any associated Data Lane beginning the transition from LP to HS mode	$8xUI$	-	ns

Note: UI definition : $UI = UI_{INSTA} = UI_{INSTB}$

18. Application Circuit

The following table shows specifications of external elements connected to the ILI9486's power supply circuit.

Items	Recommended Specification	Pin connection
Capacity 1 μ F (B characteristics)	6.3V	C11A/B, C13A/B, C15A/B, VGL(back up), VDD(back up), N_VCORE(back up)
	10V	DDVDH, DDVDL
	16V	C21 A/B, C22A/B(for +6,-3 backup)
	25V	VGH (back up), VGL (back up)

19. Revision History

Version No.	Date	Page	Description
V.001	2010/09/02	All	New created
V.001	2010/11/04	147	Modify command list
		286	Add LCM voltage generation
		310	Application circuit
