

IM68A130V01

High performance analog XENSIV™ MEMS microphone

Features

- Surface mount package: 3.35mm x 2.5mm x 0.98mm
- Analog single-ended output
- Flat frequency response with low-frequency roll-off at 10Hz
- Acoustic overload point at 130dB SPL
- Signal-to-noise ratio of 68dB(A) SNR
- Narrow sensitivity and phase tolerances
- Omnidirectional pickup pattern

Potential applications

- Active Noise Cancellation (ANC) headphones and earphones
- Smartphones and mobile devices
- Devices with Voice User Interface (VUI)
 - Smart speakers
 - Home automation
 - IOT devices
- High quality audio capturing
 - Laptops and tablets
 - Conference systems
 - Cameras and camcorders
- Industrial or home monitoring with audio pattern detection

Product validation

Technology qualified for industrial applications.

Ready for validation in industrial applications according to the relevant tests of IEC 60747 and 60749 or alternatively JEDEC47/20/22.

Description

The IM68A130V01 is a high performance, single-ended, analog MEMS microphone designed for applications which require a low LFRO (10Hz), a high SNR (low self-noise), and low distortion (high AOP).

The high signal-to-noise ratio (SNR) of 68dB(A) enables far field and low volume audio pick-up. The flat frequency response and tight manufacturing tolerance improve the performance of Active Noise Cancellation (ANC) and multi-microphone array applications.

The high performance analog microphone ASIC contains an extremely low noise preamplifier providing constant current consumption (110µA) over VDD.

Each IM68A130V01 microphone is calibrated with an advanced Infineon calibration algorithm, resulting in small sensitivity tolerances (± 1 dB).

7 Footprint and stencil recommendation

The acoustic port hole diameter in the PCB should be larger than the acoustic port hole diameter of the MEMS microphone to ensure optimal performance. A PCB sound port size of diameter 0.6 mm is recommended.

The board pad and stencil aperture recommendations shown in [Figure 13](#) are based on Non Solder Mask Defined (NSMD) pads. The specific design rules of the board manufacturer should be considered for individual design optimizations or adaptations.

Figure 13 Footprint and stencil recommendation

8 Packing information

For shipping and assembly the Infineon microphones are packed in product specific tape-and-reel carriers. A detailed drawing of the carrier can be seen in [Figure 14](#)

9 Reflow soldering and board assembly

Infineon MEMS microphones are qualified in accordance with the IPC/JEDEC J-STD-020D-01. The moisture sensitivity level of MEMS microphones is rated as MSL1. For PCB assembly of the MEMS microphone the widely used reflow soldering using a forced convection oven is recommended.

The soldering profile should be in accordance with the recommendations of the solder paste manufacturer to reach an optimal solder joint quality. The reflow profile shown in Figure 15 is recommended for board manufacturing with Infineon MEMS microphones.

Figure 15 Recommended reflow profile

Table 8 Reflow profile limits

Profile feature	Pb-Free assembly	Sn-Pb Eutectic assembly
Temperature Min (T _{smin})	150 °C	100 °C
Temperature Max (T _{smax})	200 °C	150 °C
Time (T _{smin} to T _{smax}) (t _s)	60-120 seconds	60-120 seconds
Ramp-up rate (T _L to T _p)	3 °C/second max.	3 °C/second max.
Liquidous temperature (T _L)	217 °C	183 °C
Time (t _L) maintained above T _L	60-150 seconds	60-150 seconds
Peak Temperature (T _p)	260°C +0°C/-5°C	235°C +0°C/-5°C
Time within 5°C of actual peak temperature (t _p) ²⁾	20-40 seconds	10-30 seconds
Ramp-down rate	6 °C/second max.	6 °C/second max.
Time 25°C to peak temperature	8 minutes max.	6 minutes max.

Note: For further information please consult the 'General recommendation for assembly of Infineon packages' document which is available on the Infineon Technologies [web page](#)

² Tolerance for peak profile temperature (T_p) is defined as a supplier minimum and a user maximum

The MEMS microphones can be handled using industry standard pick and place equipment. Care should be taken to avoid damage to the microphone structure as follows:

- Do not pick the microphone with vacuum tools which make contact with the microphone acoustic port hole.
- The microphone acoustic port hole should not be exposed to vacuum, this can destroy or damage the MEMS.
- Do not blow air into the microphone acoustic port hole. If an air blow cleaning process is used, the port hole must be sealed to prevent particle contamination.
- It is recommended to perform the PCB assembly in a clean room environment in order to avoid microphone contamination.
- Air blow and ultrasonic cleaning procedures shall not be applied to MEMS Microphones. A no-clean paste is recommended for the assembly to avoid subsequent cleaning steps. The microphone MEMS can be severely damaged by cleaning substances.
- To prevent the blocking or partial blocking of the sound port during PCB assembly, it is recommended to cover the sound port with protective tape during PCB sawing or system assembly.
- Do not use excessive force to place the microphone on the PCB. The use of industry standard pick and place tools is recommended in order to limit the mechanical force exerted on the package.

10 Reliability specifications

The microphone sensitivity after stress must deviate by no more than 3dB from the initial value.
