

POWER MANAGEMENT

General Description

The IMP811/IMP812 are low-power supervisors designed to monitor voltage levels of 2.5V, 3.0V, 3.3V and 5.0V power supplies in low-power micro-processor (μ P), microcontroller (μ C) and digital systems. Each features a debounced manual reset input. The IMP811/812 are improved drop-in replacements for the Maxim MAX811/812 with extended temperature specifications to 125°C.

A reset signal is issued if the power supply voltage drops below a preset threshold and is asserted for at least 140ms after the supply has risen above the reset threshold. The IMP811 has an active-low output RESET that is guaranteed to be in the correct state for VCC down to 1.1V. The IMP812 has an active-high output RESET. The reset comparator is designed to ignore fast transients on VCC.

Low power consumption makes the IMP811/IMP812 ideal for use in portable and battery-operated equipment. Available in a compact 4-pin SOT143 package, the devices use minimal board space.

Three voltage thresholds are available to support 2.5V to 5V systems:

Reset Threshold	
Suffix	Voltage (V)
L	4.63
M	4.38
J	4.00
T	3.08
S	2.93
R	2.63
Z	2.32

Key Features

- Improved Maxim MAX811/MAX812 replacement
 - Specified to 125°C
- 6 μ A supply current
- Monitor 5V, 3.3V, 3V and 2.5V supplies
- Manual reset input
- 140ms min. reset pulse width
- Guaranteed over temperature
- Active-LOW reset valid with 1.1V supply (IMP811)
- Small 4-pin SOT-143 package
- No external components
- Power-supply transient-immune design

Applications

- Computers and controllers
- Embedded controllers
- Battery operated systems
- Intelligent instruments
- Wireless communication systems
- PDAs and handheld equipment

Notes: 1. Tape and Reel packaging is indicated by the /T designation.

2. Devices may also be marked with full part number: 811L, 812M etc. XXX refers to lot.

Absolute Maximum Ratings

Pin Terminal Voltage with Respect to Ground

V_{CC} -0.3V to 6.0V

RESET, $\overline{\text{RESET}}$ and $\overline{\text{MR}}$ -0.3V to ($V_{CC} + 0.3V$)

Input Current at V_{CC} and $\overline{\text{MR}}$ 20mA

Output Current: RESET or $\overline{\text{RESET}}$ 20mA

Rate of Rise at V_{CC} 100V/ μ s

Power Dissipation ($T_A = 70^\circ\text{C}$) 320mW
(Derate SOT-143 4mW/ $^\circ\text{C}$ above 70 $^\circ\text{C}$)

Operating Temperature Range -40 $^\circ\text{C}$ to 125 $^\circ\text{C}$

Storage Temperature Range -65 $^\circ\text{C}$ to 160 $^\circ\text{C}$

Lead Temperature (soldering, 10 sec) 300 $^\circ\text{C}$

These are stress ratings only and functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability.

POWER MANAGEMENT

Electrical Characteristic

Unless otherwise noted V_{CC} is over the full voltage range, $T_A = -40^{\circ}\text{C}$ to 125°C .

Typical values at $T_A = 25^{\circ}\text{C}$, $V_{CC} = 5\text{V}$ for L/M/J devices, $V_{CC} = 3.3\text{V}$ for T/S devices and $V_{CC} = 3\text{V}$ for R devices, $V_{CC}=2.5\text{V}$ for Z devices

Parameter	Symbol	Conditions	Min	Typ	Ma	Units

POWER MANAGEMENT

Electrical Characteristic

Unless otherwise noted V_{CC} is over the full voltage range, $T_A = -40^{\circ}\text{C}$ to 125°C .

Typical values at $T_A = 25^{\circ}\text{C}$, $V_{CC} = 5\text{V}$ for L/M/J devices, $V_{CC} = 3.3\text{V}$ for T/S devices and $V_{CC} = 3\text{V}$ for R devices, $V_{CC} = 2.5\text{V}$ for Z devices

Low RESET Output Voltage (IMP811)	V_{OL}	$V_{CC} = V_{TH \text{ min.}}, I_{SINK} = 1.2\text{mA}, \text{IMP811R/S/T/Z}$			0.3	V
		$V_{CC} = V_{TH \text{ min.}}, I_{SINK} = 3.2\text{mA}, \text{IMP811L/M/J}$			0.4	
		$V_{CC} > 1.1\text{V}, I_{SINK} = 50\mu\text{A}$			0.3	
High RESET Output Voltage (IMP811)	V_{OH}	$V_{CC} > V_{TH \text{ max.}}, I_{SOURCE} = 500\mu\text{A}, \text{IMP811R/S/T/Z}$	$0.8V_{CC}$			V
		$V_{CC} > V_{TH \text{ max.}}, I_{SOURCE} = 800\mu\text{A}, \text{IMP811L/M/J}$	$V_{CC} - 1.5$			
Low RESET Output Voltage (IMP812)	V_{OL}	$V_{CC} = V_{TH \text{ max.}}, I_{SINK} = 1.2\text{mA}, \text{IMP812R/S/T/Z}$			0.3	V
		$V_{CC} = V_{TH \text{ max.}}, I_{SINK} = 3.2\text{mA}, \text{IMP812L/M/J}$			0.4	
High RESET Output Voltage (IMP812)	V_{OH}	$1.8\text{V} < V_{CC} < V_{TH \text{ min.}}, I_{SOURCE} = 150\mu\text{A}$	$0.8V_{CC}$			V

- Notes: 1. Production testing done at $T_A = 25^{\circ}\text{C}$. Over temperature specifications guaranteed by design only using six sigma design limits.
 2. RESET output is active LOW for the IMP811 and RESET output is active HIGH for the IMP812.
 3. Glitches of 100ns or less typically will not generate a reset pulse.

Pin Descriptions

Pin Number	Name	Function
1	GND	Ground
2 (IMP811)	$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ is asserted LOW if V_{CC} falls below the reset threshold and remains LOW for the 240ms typical reset timeout period (140ms minimum) after V_{CC} exceeds the threshold.
2 (IMP812)	RESET	RESET is asserted HIGH if V_{CC} falls below the reset threshold and remains HIGH for the 240ms typical reset timeout period (140ms minimum) after V_{CC} exceeds the threshold.
3	$\overline{\text{MR}}$	Manual Reset Input. A logic LOW on $\overline{\text{MR}}$ asserts RESET. RESET remains active as long as $\overline{\text{MR}}$ is LOW and for 180ms after $\overline{\text{MR}}$ returns HIGH. The active low input has an internal $20\text{k}\Omega$ pull-up resistor. The input should be left open if not used. It can be driven by TTL or CMOS logic or shorted to ground by a switch..
4	V_{CC}	Power supply input voltage (2.5V,3.0V,3.3V,5V)

POWER MANAGEMENT

Typical Performance Characteristics

Reset Timing and Manual Reset ($\overline{\text{MR}}$)

The reset signal is asserted–LOW for the IMP811 and HIGH for the IMP812 – when the VCC signal falls below the threshold trip voltage and remains asserted for 140ms minimum after the VCC has risen above the threshold.

Logic low on $\overline{\text{MR}}$ asserts RESET LOW on the IMP811 and HIGH on the IMP812. $\overline{\text{MR}}$ is internally pulled high through a 20k Ω resistor and can be driven by TTL/CMOS gates or with open collector/drain outputs. $\overline{\text{MR}}$ can be left open if not used.

$\overline{\text{MR}}$ may be connected to a normally-open switch connected to ground without an external debounce circuit. For added noise rejection, a 0.1 μF capacitor from $\overline{\text{MR}}$ to Ground can be added.

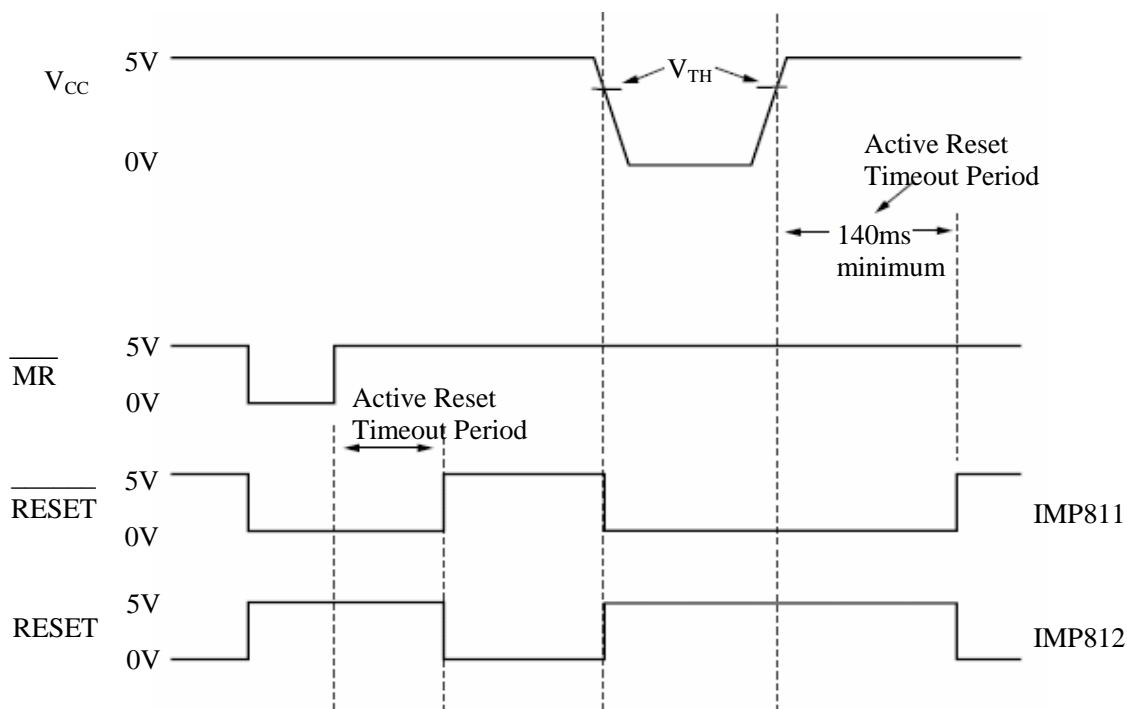

Figure 1. Reset Timing Diagram

RESET Output Operation

In $\mu\text{P}/\mu\text{C}$ systems it is important to have the processor begin operation from a known state or be able to return the system to a known state. A RESET output to a processor is provided to prevent improper operation during power supply sequencing or low voltage – brownout – conditions.

The IMP811/812 are designed to monitor the system power supply voltages and issue a RESET signal when levels are out of range. RESET outputs are guaranteed to be active for VCC above 1.1V. When VCC exceeds the reset threshold, an internal timer keeps RESET active for the reset timeout period, after which RESET becomes inactive (HIGH for the IMP811 and LOW for the IMP812).

POWER MANAGEMENT

Typical Performance Characteristics

Valid Reset with V_{CC} under 1.1V

To ensure that logic inputs connected to the IMP811 $\overline{\text{RESET}}$ pin are in a known state when V_{CC} is under 1.1V, a 100k Ω pull-down resistor at $\overline{\text{RESET}}$ is needed. The value is not critical.

A similar pull-up resistor to V_{CC} is needed with the IMP812.

If V_{CC} drops below the reset threshold, $\overline{\text{RESET}}$ automatically becomes active. Alternatively, external circuitry or a human operator can initiate this condition using the Manual Reset ($\overline{\text{MR}}$) pin. There is an internal pullup on $\overline{\text{MR}}$ so it can be left open if it is not used. $\overline{\text{MR}}$ can be driven by TTL/CMOS logic or even an external switch, since it is already debounced. If the switch is at the end of a long cable, it might require a bypass (100nF) at the pin if noise pickup is a problem.

Eight voltage thresholds are available to support 2.5V and 5V systems:

Reset Threshold	
Suffix	Voltage (V)
L	4.63
M	4.38
J	4.00
T	3.08
S	2.93
R	2.63
Z	2.32

Figure 3. RESET Valid with V_{CC} Under 1.1V

POWER MANAGEMENT

Typical Performance Characteristics

(Continued)

Negative Vcc Transients

Typically short duration transients of 100mV amplitude and 20 μ s duration do not cause a false RESET.

A 0.1 μ F capacitor at VCC increases transient immunity.

Bi-directional Reset Pin Interfacing

The IMP811/812 can interface with μ P/ μ C bi-directional reset pins by connecting a 4.7k Ω resistor in series with the IMP809/810 reset output and the μ P/ μ C bi-directional reset pin.

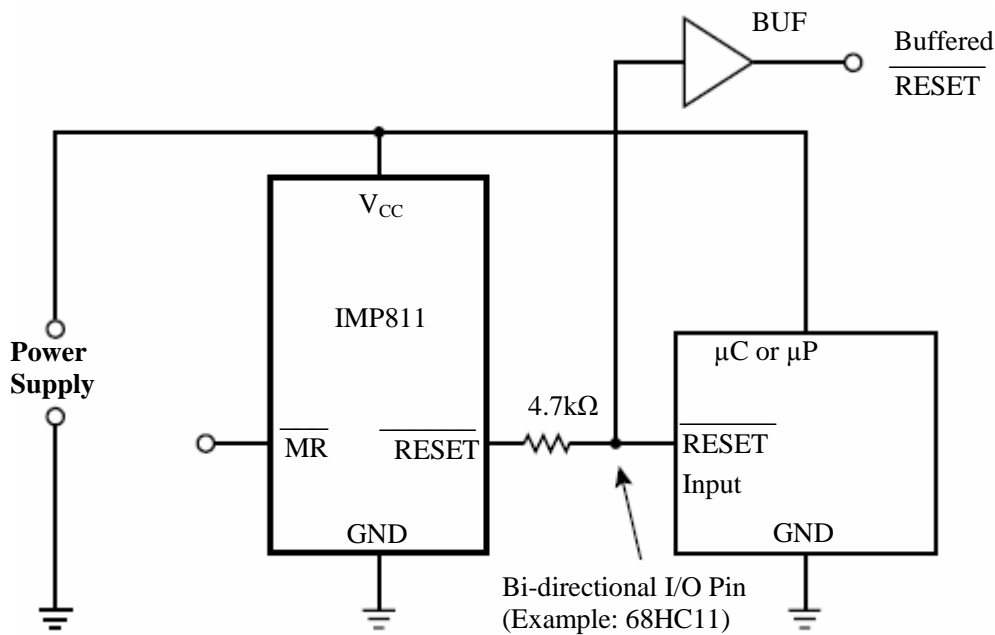

Figure 4. Bi-directional Reset Pin Interfacing
