

Diagonal 8.58 mm (Type 1/1.9) CMOS Solid-state Image Sensor with Square Pixel for Color Cameras

IMX185LQJ-C

Description

The IMX185LQJ-C is a diagonal 8.58 mm (Type 1/1.9) CMOS active pixel type solid-state image sensor with a square pixel array and 2.38 M effective pixels. This chip operates with analog 3.3 V, digital 1.2 V, and digital 1.8 V triple power supply, and has low power consumption. High sensitivity, low dark current and no smear are achieved through the adoption of R, G and B primary color mosaic filters. This chip features an electronic shutter with variable charge-integration time.

(Applications: Surveillance cameras, FA cameras, Industrial cameras)

Features

- ◆ CMOS active pixel type dots
- ◆ Built-in timing adjustment circuit, H/V driver and serial communication circuit
- ◆ Input frequency: 27 MHz / 54 MHz / 37.125 MHz / 74.25 MHz
- ◆ Number of recommended recording pixels: 1920 (H) × 1200 (V) approx. 2.31 M pixels
- ◆ Readout mode
 - All-pixel scan mode
 - Horizontal / vertical 2/2-line binning readout mode
 - 1080p-HD readout mode
 - Vertical direction normal/inverted readout mode
 - Horizontal direction normal/inverted readout mode
 - Window cropping mode
- ◆ Readout rate
 - Maximum frame rate in 1080p-HD readout mode: 120 frame/s
- ◆ Variable-speed shutter function (resolution 1H units)
- ◆ 10/12-bit A/D converter
- ◆ CDS/PGA function
 - 0 dB to 24 dB: Analog Gain 24 dB (step pitch 0.3 dB)
 - 24.3 dB to 48 dB: Analog Gain 24 dB + Digital Gain 0.3 to 24 dB (step pitch 0.3 dB)
- ◆ Supports I/O switching
 - Low voltage LVDS (150 mVp-p) parallel DDR output
 - Low voltage LVDS (150 mVp-p) serial (2 ch / 4 ch switching) DDR output
 - CSI-2 serial data output (2 Lane / 4 Lane, RAW10/RAW12 output)
- ◆ Recommend lens F number: 2.8 or more
- ◆ Recommended exit pupil distance: -30 mm to $-\infty$

Exmor[™]

* "Exmor" is a trademark of Sony Corporation. The "Exmor" is a version of Sony's high performance CMOS image sensor with high-speed processing, low noise and low power dissipation by using column-parallel A/D conversion.

Sony reserves the right to change products and specifications without prior notice.

This information does not convey any license by any implication or otherwise under any patents or other right.

Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

Device Structure

- ◆ CMOS image sensor
- ◆ Image size
Diagonal 8.58 mm (Type 1/1.9)
- ◆ Total number of pixels
1952 (H) × 1241 (V) approx. 2.42 M pixels
- ◆ Number of effective pixels
1945 (H) × 1225 (V) approx. 2.38 M pixels
- ◆ Number of active pixels
1937 (H) × 1217 (V) approx. 2.36 M pixels (WUXGA) Diagonal 8.58 mm
1937 (H) × 1097 (V) approx. 2.12 M pixels (1080p-HD) Diagonal 8.35 mm
- ◆ Number of recommended recording pixels
1920 (H) × 1200 (V) approx. 2.31 M pixels (WUXGA)
1920 (H) × 1080 (V) approx. 2.07 M pixels (1080p-HD)
- ◆ Chip size
10.10 mm (H) × 8.05 mm (V)
- ◆ Unit cell size
3.75 μm (H) × 3.75 μm (V)
- ◆ Optical black
Horizontal (H) direction: Front 4 pixels, rear 0 pixels
Vertical (V) direction : Front 16 pixels, rear 0 pixels
- ◆ Dummy
Horizontal (H) direction: Front 0 pixels, rear 3 pixels
Vertical (V) direction : Front 0 pixels, rear 0 pixels
- ◆ Substrate material
Silicon

Supply voltage (digital 1.2 V)	DV _{DD}	1.1	1.2	1.3	V

USE RESTRICTION NOTICE

This USE RESTRICTION NOTICE ("Notice") is for customers who are considering or currently using the image sensor products ("Products") set forth in this specifications book. Sony Corporation ("Sony") may, at any time, modify this Notice which will be available to you in the latest specifications book for the Products. You should abide by the latest version of this Notice. If a Sony subsidiary or distributor has its own use restriction notice on the Products, such a use restriction notice will additionally apply between you and the subsidiary or distributor. You should consult a sales representative of the subsidiary or distributor of Sony on such a use restriction notice when you consider using the Products.

Use Restrictions

- The Products are intended for incorporation into such general electronic equipment as office products, communication products, measurement products, and home electronics products in accordance with the terms and conditions set forth in this specifications book and otherwise notified by Sony from time to time.
- You should not use the Products for critical applications which may pose a life- or injury-threatening risk or are highly likely to cause significant property damage in the event of failure of the Products. You should consult your sales representative beforehand when you consider using the Products for such critical applications. In addition, you should not use the Products in weapon or military equipment.
- Sony disclaims and does not assume any liability and damages arising out of misuse, improper use, modification, use of the Products for the above-mentioned critical applications, weapon and military equipment, or any deviation from the requirements set forth in this specifications book.

Design for Safety

- Sony is making continuous efforts to further improve the quality and reliability of the Products; however, failure of a certain percentage of the Products is inevitable. Therefore, you should take sufficient care to ensure the safe design of your products such as component redundancy, anti-conflagration features, and features to prevent mis-operation in order to avoid accidents resulting in injury or death, fire or other social damage as a result of such failure.

Export Control

- If the Products are controlled items under the export control laws or regulations of various countries, approval may be required for the export of the Products under the said laws or regulations. You should be responsible for compliance with the said laws or regulations.

No License Implied

- The technical information shown in this specifications book is for your reference purposes only. The availability of this specifications book shall not be construed as giving any indication that Sony and its licensors will license any intellectual property rights in such information by any implication or otherwise. Sony will not assume responsibility for any problems in connection with your use of such information or for any infringement of third-party rights due to the same. It is therefore your sole legal and financial responsibility to resolve any such problems and infringement.

Governing Law

- This Notice shall be governed by and construed in accordance with the laws of Japan, without reference to principles of conflict of laws or choice of laws. All controversies and disputes arising out of or relating to this Notice shall be submitted to the exclusive jurisdiction of the Tokyo District Court in Japan as the court of first instance.

Other Applicable Terms and Conditions

- The terms and conditions in the Sony additional specifications, which will be made available to you when you order the Products, shall also be applicable to your use of the Products as well as to this specifications book. You should review those terms and conditions when you consider purchasing and/or using the Products.

Video Shading Zone Definition

Image Sensor Characteristics Measurement Method

Measurement Conditions

1. In the following measurements, the device drive conditions are at the typical values of the bias conditions and clock voltage conditions.
2. In the following measurements, spot pixels are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output, which is taken as the value of the Gr/Gb channel signal output or the R/B channel signal output of the measurement system.

Color Coding of Physical Pixel Array

The primary color filters of this image sensor are arranged in the layout shown in the figure below. Gr and Gb represent the G signal on the same line as the R and B signals, respectively. The Gb signal and B signal lines and the R signal and Gr signal lines are output successively.

Gb	B	Gb	B
R	Gr	R	Gr
Gb	B	Gb	B
R	Gr	R	Gr

Color Coding Diagram

Definition of standard imaging conditions

- ◆ Standard imaging condition I:
Use a pattern box (luminance: 706 cd/m², color temperature of 3200 K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.
- ◆ Standard imaging condition II:
Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.
- ◆ Standard imaging condition III:
Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens (exit pupil distance -30 mm) with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

TENTATIVE

Measurement Method

1. Sensitivity

Set the measurement condition to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of 1/100 s, measure the Gr and Gb signal outputs (VGr, VGb) at the center of the screen, and substitute the values into the following formula.

$$Sg = (VGr + VGb) / 2 \times 100 / 30 \text{ [mV]}$$

2. Sensitivity ratio

Set the measurement condition to the standard imaging condition II. After adjusting the average value of the Gr and Gb signal outputs to 1120 mV, measure the R signal output (VR [mV]), the Gr and Gb signal outputs (VGr, VGb [mV]) and the B signal output (VB [mV]) at the center of the screen in frame readout mode, and substitute the values into the following formulas.

$$VG = (VGr + VGb) / 2$$

$$RG = VR / VG$$

$$BG = VB / VG$$

3. Saturation signal

Set the measurement condition to the standard imaging condition II. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr and Gb signal outputs, 500 mV, measure the average values of the Gr, Gb, R and B signal outputs.

4. Video signal shading

Set the measurement condition to the standard imaging condition III. With the lens diaphragm at F2.8, adjust the luminous intensity so that the average value of the Gr and Gb signal outputs is 1120 mV. Then measure the maximum value (Gmax [mV]) and the minimum value (Gmin [mV]) of the Gr and Gb signal outputs, and substitute the values into the following formula.

$$SH = (Gmax - Gmin) / 1120 \times 100 \text{ [%]}$$

5. Dark signal

With the device junction temperature of 60 °C and the device in the light-obstructed state, divide the output difference between 1/30 s integration and 1/300 s integration by 0.9, and calculate the signal output converted to 1/30 s integration. Measure the average value of this output (Vdt [mV]).

6. Dark signal shading

After the measurement item 5, measure the maximum value (Vdmax [mV]) and the minimum value (Vdmin [mV]) of the dark signal output, and substitute the values into the following formula.

$$\Delta Vdt = Vdmax - Vdmin \text{ [mV]}$$

7. Line crawl

Set the measurement condition to the standard imaging condition II. After adjusting the average value of the Gr signal output to 1120 mV, insert R and B filters and measure the difference between G signal lines (ΔG_{lr} , ΔG_{lb} [mV]) as well as the average values of the G signal outputs (Gar, Gab). Substitute the values into the following formula.

$$Lci = (\Delta G_{li} / G_{ai}) \times 100 \text{ [%]} \text{ (i = r, b)}$$

TENTATIVE

8. Lag

Adjust the G signal output value generated by strobe light to 80 mV. After setting the strobe light so that it strobes with the following timing, measure the residual signal (Glag), and substitute the value into the following formula.

$$\text{Lag} = (\text{Glag} / 80) \times 100 [\%]$$

Inc. only

Setting Registers with Serial Communication

This sensor can write and read the setting values of the various registers shown in the Register Map by 4-wire serial communication and I²C communication. See the Register Map for the addresses and setting values to be set. Because the two communication systems are judged at the first communication, once they are judged, the communication cannot be switched until sensor reset. The pin for 4-wire serial communication and I²C communication is shared, so the external pin XCE must be fixed to power supply side when using I²C communication.

Description of Setting Registers (4-wire)

The serial data input order is LSB-first transfer. The table below shows the various data types and descriptions.

Serial Data Transfer Order

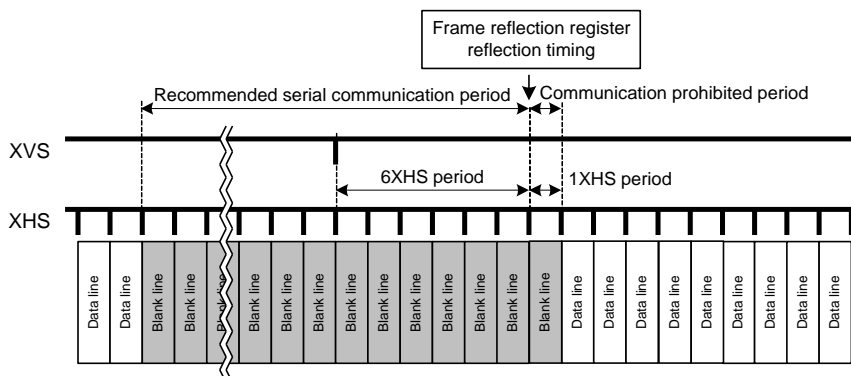

Chip ID	Start address	Data	Data	Data	...
(8 bit)	(8 bit)	(8 bit)	(8 bit)	(8 bit)	(8 bit)

Type and Description

Type	Description
Chip ID	02h: Write to the CID = 02h register 03h: Write to the CID = 03h register 04h: Write to the CID = 04h register 05h: Write to the CID = 05h register 82h: Read from the CID = 02h register 83h: Read from the CID = 03h register 84h: Read from the CID = 04h register 85h: Read from the CID = 05h register
Address	Designate the address according to the Register Map. When using a communication method that designates continuous addresses, the address is automatically incremented from the previously transmitted address.
Data	Input the setting values according to the Register Map.

Register Communication Timing (4-wire)

Perform serial communication in sensor standby mode or within in the 6XHS period after the falling edge of XVS from the blanking line output start time after valid line of one frame is finished. (In CSI-2 output master mode, this period is from the blanking line after FE to before 2 H period from FS.) For the registers marked "V" in the item of Reflection timing, when the communication is performed in the communication period shown in the figure below they are reflected by frame reflection timing. For the registers noted "Immediately" in the item of Reflection timing, the settings are reflected when the communication is performed. (For the immediate reflection registers other than STANDBY, REGHOLD, XMSTA, SW_RESET, XVSOUTSEL [1:0] and XHSOUTSEL [1:0], set them in sensor standby state.)

Register Write and Read (4-wire)

Follow the communication procedure below when writing registers.

- (1) Set XCE Low to enable the chip's communication function. Serial data input is executed using SCK and SDI.
- (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
- (3) Input the Chip ID (CID = 02h or 03h or 04h or 05h) to the first byte. If the Chip ID differs, subsequent data is ignored.
- (4) Input the start address to the second byte. The address is automatically incremented.
- (5) Input the data to the third and subsequent bytes. The data in the third byte is written to the register address designated by the second byte, and the register address is automatically incremented thereafter when writing the data for the fourth and subsequent bytes. Normal register data is loaded to the inside of the sensor and established in 8-bit units.
- (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The register values before the write operation are output. The actual register values are the input data.
- (7) Set XCE High to end communication.

Follow the communication procedure below when reading registers.

- (1) Set XCE Low to enable the chip's communication function. Serial data input is executed using SCK and SDI.
- (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
- (3) Input Chip ID (CID = 82h or 83h or 84h or 85h) to the first byte. If the Chip ID differs, subsequent data is ignored.
- (4) Input the start address to the second byte. The address is automatically incremented.
- (5) Input data to the third and subsequent bytes. Input dummy data in order to read the registers. The dummy data is not written to the registers. To read continuous data, input the necessary number of bytes of dummy data.
- (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The input data is not written, so the actual register values are output.
- (7) Set XCE High to end communication.

Note) When writing data to multiple registers with discontinuous addresses, access to undesired registers can be avoided by repeating the above procedure multiple times.

Serial Communication (Continuous Addresses)

Serial Communication (Discontinuous Addresses)

Description of Setting Registers (I²C)

The serial data input order is MSB-first transfer. The table below shows the various data types and descriptions.

Pin connection of serial communication

SLAVE Address

MSB							LSB
0	0	1	1	0	1	0	R / W

* RW is data direction bit

R/W

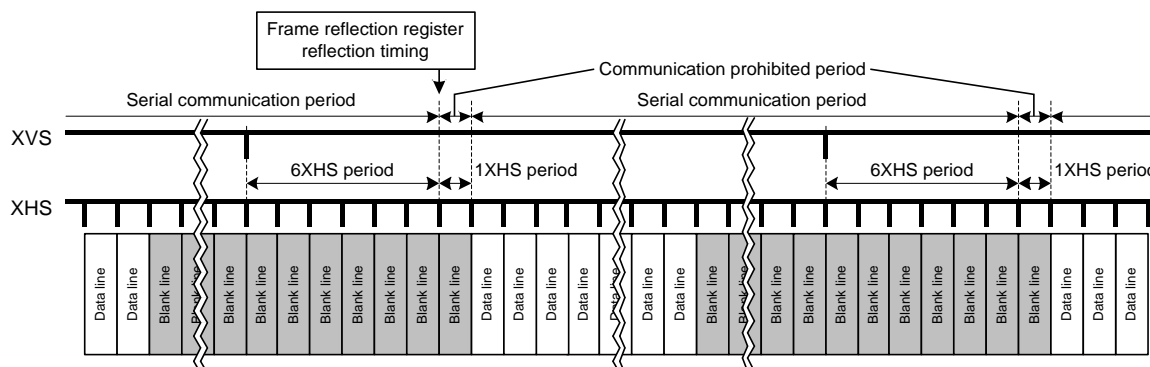

R / W bit	Data direction
0	Write (Master → Sensor)
1	Read (Sensor → Master)

I²C pin description

Symbol	Pin No.	Description
SCL (common to SCK)	J2	Serial clock input
SDA (common to SDI)	F1	Serial data communication

Register Communication Timing (I²C)

In I²C communication system, communication can be performed excluding during the period when communication is prohibited from the falling edge of XVS to 6H after (1 H period : In CSI-2 output master mode, before 1 H period from FS). For the registers marked "V" in the item of Reflection timing, when the communication is performed in the communication period shown in the figure below they are reflected by frame reflection timing. For the registers noted "Immediately" in the item of Reflection timing, the settings are reflected when the communication is performed. (For the immediate reflection registers other than STANDBY, REGHOLD, XMSTA, SW_RESET, XVSOUTSEL [1:0] and XHSOUTSEL [1:0], set them in sensor standby state.) Using REG_HOLD function is recommended for register setting using I²C communication. For REG_HOLD function, see "Register Transmission Setting" in "Description of Functions".

TENTATIVE

I²C Communication Protocol

I²C serial communication supports a 16-bit register address and 8-bit data message type.

Communication protocol

Data is transferred serially, MSB first in 8-bit units. After each data byte is transferred, A (Acknowledge) / \bar{A} (Negative Acknowledge) is transferred. Data (SDA) is transferred at the clock (SCL) cycle. SDA can change only while SCL is Low, so the SDA value must be held while SCL is High. The Start Condition is defined by SDA changing from High to Low while SCL is High. When the Stop Condition is not generated in the previous communication phase and Start Condition for the next communication is generated, that Start Condition is recognized as a Repeated Start Condition.

Start Condition

Stop Condition

Repeated Start Condition

After transfer of each data byte, the Master or the sensor transmits an Acknowledge / Negative Acknowledge and release (does not drive) SDA. When Negative Acknowledge is generated, the Master must immediately generate the Stop Condition and end the communication.

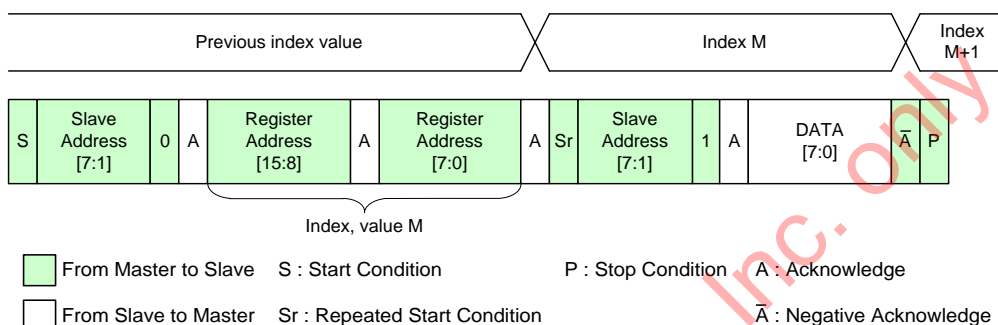

Acknowledge and Negative Acknowledge

I²C Serial Communication Read/Write Operation

This sensor supports the following four read operations and two write operations.

Single Read from Random Location

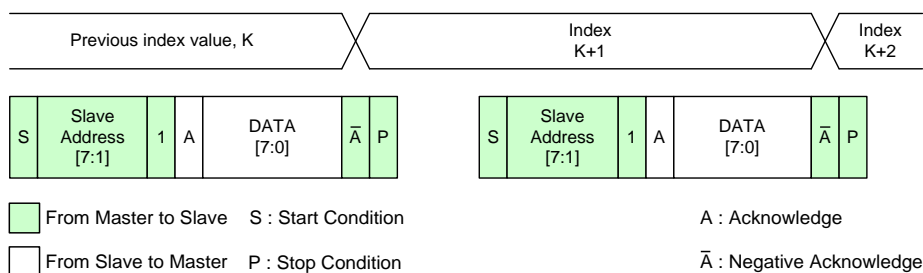

The sensor has an index function that indicates which address it is focusing on. In reading the data at an optional single address, the Master must set the index value to the address to be read. For this purpose it performs dummy write operation up to the register address. The upper level of the figure below shows the sensor internal index value, and the lower level of the figure shows the SDA I/O data flow. The Master sets the sensor index value to M by designating the sensor slave address with a write request, then designating the address (M). Then, the Master generates the Start Condition. The Start Condition is generated without generating the Stop Condition, so it becomes the Repeated Start Condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge immediately followed by the index address data on SDA. After the Master receives the data, it generates a Negative Acknowledge and the Stop Condition to end the communication.

Single Read from Random Location

Single Read from Current Location

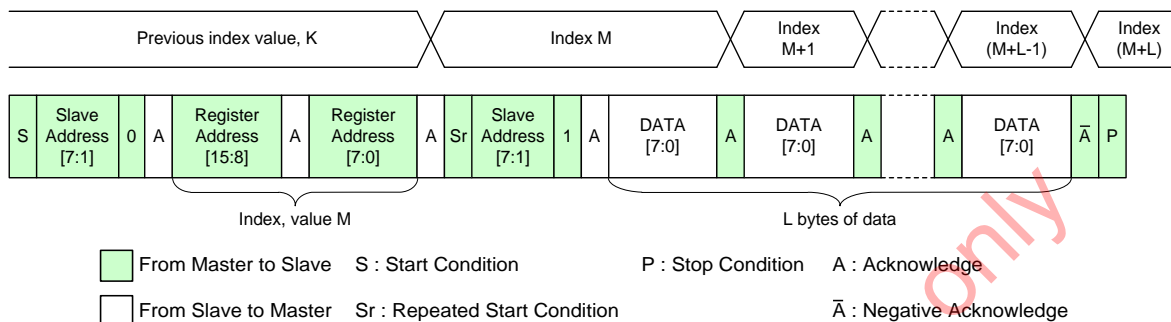

After the slave address is transmitted by a write request, that address is designated by the next communication and the index holds that value. In addition, when data read/write is performed, the index is incremented by the subsequent Acknowledge/Negative Acknowledge timing. When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after Acknowledge. After receiving the data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication, but the index value is incremented, so the data at the next address can be read by sending the slave address with a read request.

Single Read from Current Location

Sequential Read Starting from Random Location

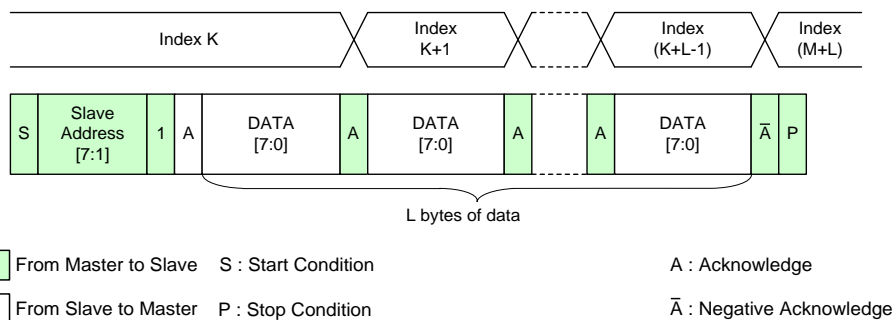

In reading data sequentially, which is starting from an optional address, the Master must set the index value to the start of the addresses to be read. For this purpose, dummy write operation includes the register address setting. The Master sets the sensor index value to M by designating the sensor slave address with a read request, then designating the address (M). Then, the Master generates the Repeated Start Condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge followed immediately by the index address data on SDA. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

Sequential Read Starting from Random Location

Sequential Read Starting from Current Location

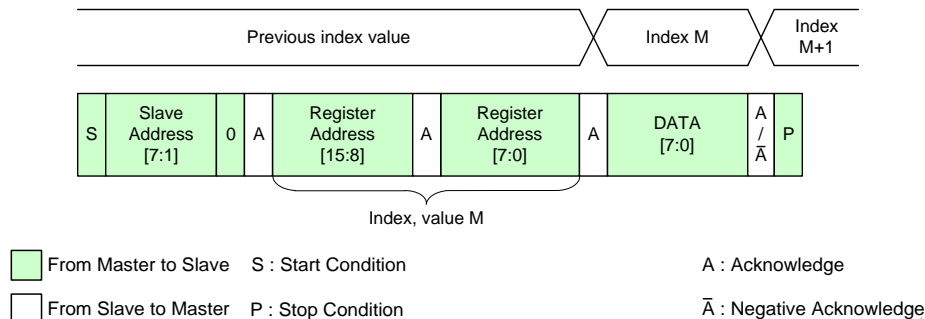

When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after the Acknowledge. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

Sequential Read Starting from Current Location

Single Write to Random Location

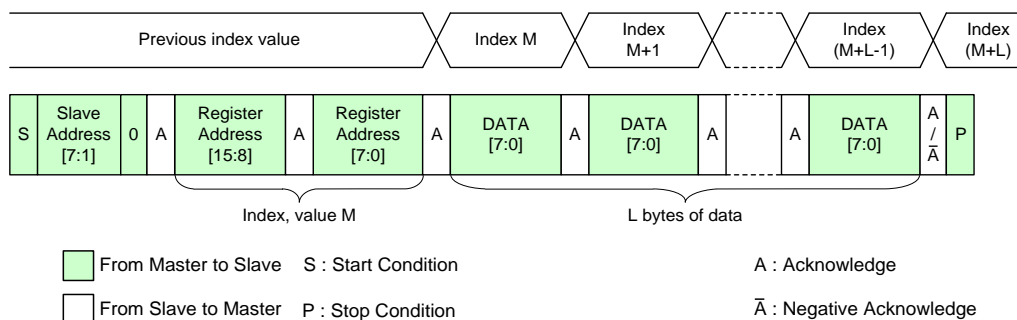

The Master sets the sensor index value to M by designating the sensor slave address with a write request, and designating the address (M). After that the Master can write the value in the designated register by transmitting the data to be written. After writing the necessary data, the Master generates the Stop Condition to end the communication.

Single Write to Random Location

Sequential Write Starting from Random Location

The Master can write a value to register address M by designating the sensor slave address with a write request, designating the address (M), and then transmitting the data to be written. After the sensor receives the write data, it outputs an Acknowledge and at the same time increments the register address, so the Master can write to the next address simply by continuing to transmit data. After the Master writes the necessary number of bytes, it generates the Stop Condition to end the communication.

Sequential Write Starting from Random Location

Register Map

In 4-wire serial communication, this sensor has a total of 1020 bytes of registers, composed of registers with addresses 00h to FFh that correspond to Chip ID = 02h (write mode) / 82h (read mode), registers with addresses 00h to FFh that correspond to Chip ID = 03h (write mode) /83h (read mode), registers with addresses 00h to FFh that correspond to Chip ID = 04h (write mode) /84h (read mode).and registers with addresses 00h to FFh that correspond to Chip ID = 05h (write mode) /85h (read mode). Use the initial values for empty address. Some registers must be change from the initial values, so the sensor control side should be capable of setting 1020 bytes. I²C communication has also the same number of registers, so perform the same way above. See the table below and on the following pages for 4-wire serial communication and I²C communication address correspondence.

The register setting of Chip ID = 05h (write mode) /85h (read mode) is only for CSI-2 output mode. Therefore these registers need not be set in low-voltage LVDS output modes.

(1) 4-wire serial communication: Chip ID = 02h / I²C communication: 30**h

A2h to FFh	30A2h to 30FFh	[7:0] [7:0]		Do not rewrite			

- ^{*1} There are two different register reflection timing. Values are reflected immediately after writing to register noted as "Immediately", or at the frame reflection register reflection timing described in the item of "Register Communication Timing" in the section of "Setting Registers with Serial Communication" for registers noted as "V" in the Reflection timing column of the Register Map. For the immediate reflection registers other than STANDBY, REGHOLD, XMSTA, SW_RESET, XVSOUTSEL [1:0] and XHSOUTSEL [1:0], set them in sensor standby state.
- ^{*2} Do not rewrite to addresses not listed in the Register Map. Doing so may result in operation errors. However, in 4-wire serial communication, other registers that requires communication to address not listed above may be added, so addresses up to FFh should be supported for CID = 02h, 03h, 04h and 05h. (In I²C communication, the address 3000h to 30FFh, 3100h to 31FFh, 3200h to 32FFh and 3300h to 33FFh should be available.)

TENTATIVE

* Do not rewrite to addresses not listed in the Register Map. Doing so may result in operation errors. However, in 4-wire serial communication, other registers that requires communication to address not listed above may be added, so addresses up to FFh should be supported for CID = 02h, 03h, 04h and 05h. (In I²C communication, the address 3000h to 30FFh, 3100h to 31FFh, 3200h to 32FFh and 3300h to 33FFh should be available.)

TENTATIVE

- (4) 4-wire serial communication: Chip ID = 05h / I
- ²
- C communication: 33**h

The register setting of Chip ID = 05h is only for CSI-2 output mode. Therefore these registers need not be set in low-voltage LVDS output modes.

DFh to FFh	33DFh to 33FFh			Do not rewrite			

¹ There are two different register reflection timing. Values are reflected immediately after writing to register noted as "Immediately", or at the frame reflection register reflection timing described in the item of "Register Communication Timing" in the section of "Setting Registers with Serial Communication" for registers noted as "V" in the Reflection timing column of the Register Map. For the immediate reflection registers other than STANDBY, REGHOLD, XMSTA, set them in sensor standby state.

² Do not rewrite to addresses not listed in the Register Map. Doing so may result in operation errors. However, in 4-wire serial communication, other registers that requires communication to address not listed above may be added, so addresses up to FFh should be supported for CID = 02h, 03h, 04h and 05h. (In I²C communication, the address 3000h to 30FFh, 3100h to 31FFh, 3200h to 32FFh, and 3300h to 33FFh should be available.)

³ The register written as "RW" is a read and a write register. The register written as "ROstatic" is a read only register that the fixed value is output and also output to an embedded data line. The register written as "ROdynamic" is a read only register that the sensor setting value is output and also output to an embedded data line.

⁴ This is an address for I²C communication. In 4-wire serial communication, each address corresponds to the register when Chip ID = 02h.

Readout Drive Modes

The table below lists the operating modes available with this sensor.

List of Operation Modes and Output Rates for Low-voltage LVDS Parallel Output

Operating mode	INCK [MHz]	Frame rate [fps]	Data rate [Mpix/s]	Low-voltage LVDS Parallel	ADC (bit)	Bit width (bit)	Number of recording pixels		Total number of pixels		Number of output vertical lines and horizontal pixels		Number of INCK in 1H

Sync Code

The sync code is added just before and after “dummy signal + OB signal + effective pixel data”. The sync code is output in order of 1st, 2nd, 3rd and 4th. The fixed value is output for 1st to 3rd. (BLK: Blanking period)

Sync Code Output Timing

List of Sync Code

Sync code	1st code		2nd code		3rd code		4th code	
	10 bit	12 bit	10 bit	12 bit	10 bit	12 bit	10 bit	12 bit
SAV (Valid line)	3FFh	FFFh	000h	000h	000h	000h	200h	800h
EAV (Valid line)	3FFh	FFFh	000h	000h	000h	000h	274h	9D0h
SAV (Invalid line)	3FFh	FFFh	000h	000h	000h	000h	2ACh	AB0h
EAV (Invalid line)	3FFh	FFFh	000h	000h	000h	000h	2D8h	B60h

(Note 1) 10 bit is the value output to the DOP/M [11:2] when the register ODBIT = 0 in parallel output.

(Note 2) 12 bit is the value output to the DOA/B [11:0] when the register ODBIT = 1 in parallel output.

(Note 3) They are output to each channel seriously in MSB first when low-voltage LVDS serial. For details, see the item of "Signal output" and "Output pin setting".

Sync Code Output Timing

The sensor output signal passes through the internal circuits and is output with a latency time (system delay) relative to the horizontal sync signal. This system delay value is undefined for each line, so refer to the sync codes output from the sensor and perform synchronization.

Inc. only

Image Data Output Format

Frame Format

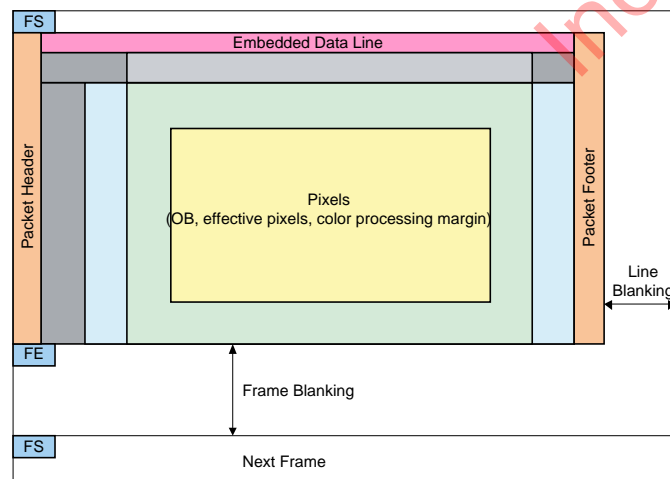

Each line of each image frame is output like the General Frame Format of CSI-2. The settings for each packet header are shown below.

Data Type

Header[5:0]	Name	Register setting (I ² C)	Description
6'h00	Frame Start Code	N.A	FS
6'h01	Frame End Code	N.A	FE
6'h10	Null	N.A	Invalid data
6'h12	Embedded Data	N.A	Embedded data
6'h2B	RAW10	Address : 0x333E,0x333F CCP_DT_FMT[15:0]	0A0Ah
6'h2C	RAW12		0C0Ch
6'h37	OB Data	N.A	Vertical OB line data

Frame Structure

The figure below shows the image frame structure.

Frame Structure of 4 Lane / 2 Lane

TENTATIVE

Embedded Data Line

The Embedded data line is output in a line following the sync code FS.

Embedded Data Format

RAW10 Output

RAW12 Output

The end of the address and the register value is determined according to the tags embedded in the data.

Embedded Data Line Tag

Tag	Data Byte Description
00h	Illegal Tag. If found treat as end of Data.
07h	End of Data.
aah	CCI Register Index MSB[15:8]
a5h	CCI Register Index LSB[7:0]
5ah	Auto increment the CCI index after the data byte – valid data Data byte contains valid CCI register data.
55h	Auto increment the CCI index after the data byte – null data A CCI register does not exist for the current CCI index. The data byte value is the 07h.
ffh	Illegal Tag. If found treat as end of Data.

TENTATIVE

Window Cropping Mode

A sensor signals are cropped and read out at arbitrary positions. Cropping is available at all-pixel scan mode, 1080p-HD mode and 720p-HD mode. Horizontal period is fixed to the value for each mode. Pixels cropped by horizontal cropping setting are output with left justified and that extends the horizontal blanking period. In vertical cropping, the number of image data is also output from cropping start line and the frame rate can be adjusted by changing the number of input XVS lines in slave mode or changing register VMAX in master mode.

Window cropping image is shown in the figure below. Cropping position is set, regarding effective pixel start position as origin (0, 0) in all pixel scan mode. Only vertical width can be set for OB (horizontal width is the same as the Window cropping width).

Window cropping image from all pixel (WUXGA) scan mode

TENTATIVE

	WINPV [10:8]	39h (3039h)	[2:0]			
WINWV [10:0]	WINWV [7:0]	3Ah (303Ah)	[7:0]	4C9h (1225d)	See below	Cropping size designation (Vertical)
	WINWV [10:8]	3Bh (303Bh)	[2:0]			
WINPH [10:0]	WINPH [7:0]	3Ch (303Ch)	[7:0]	000h	See below	Designation of upper left coordinate for cropping position (Horizontal) (Set to become a multiple of 4)
	WINPH [10:8]	3Dh (303Dh)	[2:0]			
WINWH [10:0]	WINWH [7:0]	3Eh (303Eh)	[7:0]	51Ch (1308d)	See below	Cropping size designation (Horizontal) (Set to become a multiple of 8 and plus 4)
	WINWH [10:8]	3Fh (303Fh)	[2:0]			

Restrictions on Window cropping mode

The register settings should satisfy following conditions:

$$\text{WINPH} + \text{WINWH} \leq 1948$$

$$380 \leq \text{WINWH}$$

Set WINPH to a multiple of 4, and set WINWH to a multiple of 8 and plus 4.

$$(\text{Number of lines per frame}) \text{ or } \text{VMAX} \geq \text{WINWV_OB} + \text{WINPV} + \text{WINWV} + 8$$

However,

$$6 \leq \text{WINWV_OB} \leq 16$$

$$\text{WINPV} + \text{WINWV} \leq 1225$$

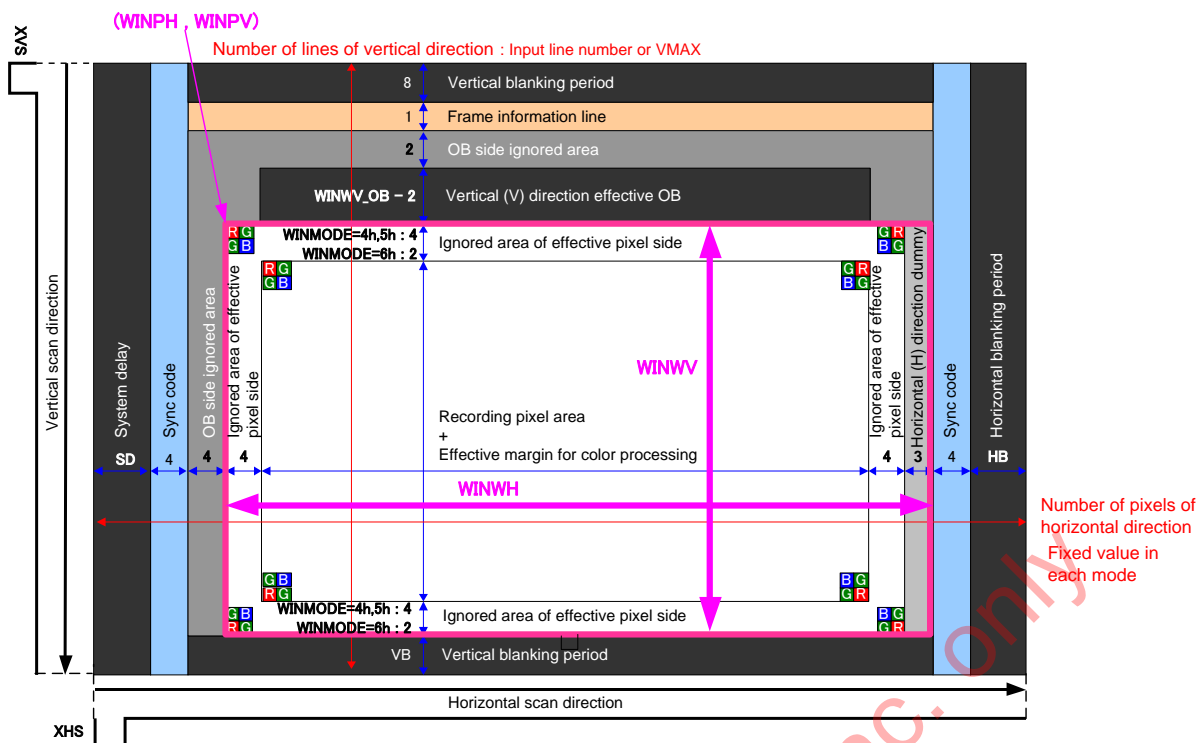

$$313 \leq \text{WINWV}$$

Frame rate on Window cropping mode

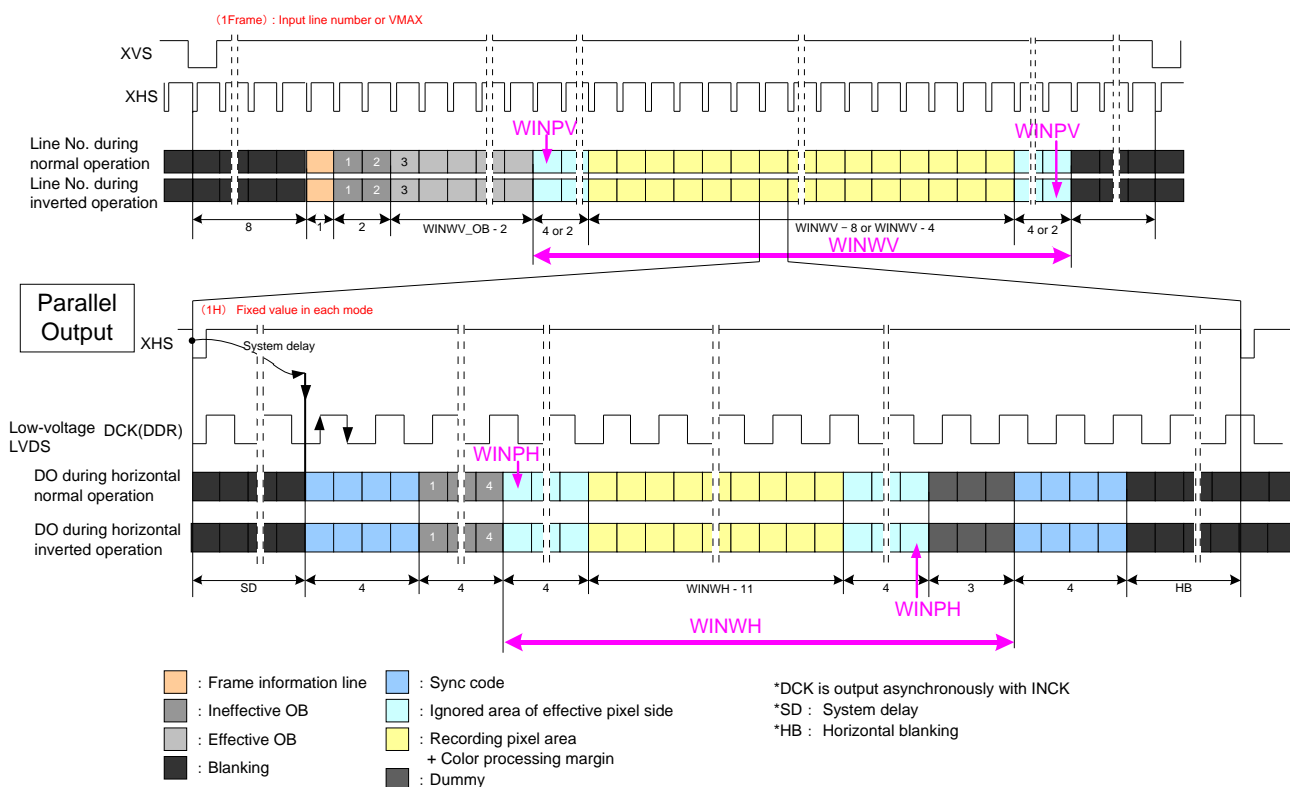

$$\text{Frame rate [frame/s]} = 1 / ((\text{"Number of lines per frame"} \text{ or } \text{VMAX}) \times (\text{1H period}))$$

1H period (unit: [μs]) : Fix 1H time in a mode before cropping and calculate it by the value of "Number of INCK in 1H" in the table of "Operating Mode" and "List of Operation Modes and Output Rates".

(WINPH, WINPV)

Pixel Array Image Drawing in Window cropping Mode (CSI-2 Output)

Drive Timing Chart for CSI-2 Serial Output in Window cropping Mode

Description of Various Function

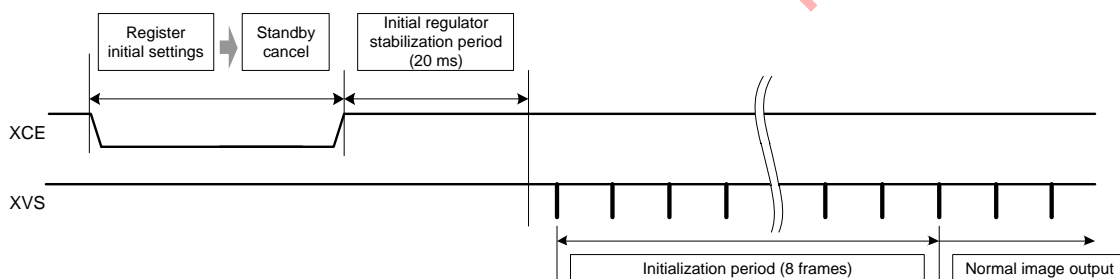

Standby Mode

This sensor stops its operation and goes into standby mode which reduces the power consumption by writing "1" to the standby control register STANDBY (address 00h (I²C: 3000h), Bit [0]). Standby mode is also established after Power-on or other system reset operation.

List of Standby Mode Setting

Register name	Register details (Chip ID = 02h)				Initial value	Setting value	Status	Remarks
	Register	Chip ID	Address () : I ² C	bit				
STANDBY	—	02h	00h (3000h)	[0]	1	1	Standby	Register communication is executed even in standby mode
						0	Operating	

The serial communication registers hold the previous values. However, the address registers transmitted in standby mode are overwritten. The serial communication block operates even in standby mode, so standby mode can be canceled by setting the STANDBY register to "0". Some time is required for sensor internal circuit stabilization after standby mode is canceled. After standby mode is canceled, a normal image is output from the 9 frames after internal regulator stabilization (20 ms or more).

Sequence from Standby Cancel to Stable Image Output

TENTATIVE

Slave Mode and Master Mode

The sensor can be switched between slave mode and master mode. The switching is made by the XMASTER pin. Establish the XMASTER pin status before canceling the system reset. (Do not switch this pin status during operation.)

Input a vertical sync signal to XVS and input a horizontal sync signal to XHS when a sensor is in slave mode. For sync signal interval, input data lines to output for vertical sync signal and 1H period designated in each operating mode for horizontal sync signal.

See the section of "Operating mode" for the number of output data line and 1H period.

Set the XMSTA register (address 02h (I²C: 3002h) [0]) to "0" in order to start the operation after setting to master mode.

In addition, set the count number of sync signal in vertical direction by the VMAX [16:0] register (address 18h (I²C: 3018h) [7:0], 19h (I²C: 3019h) [7:0], 1Ah (I²C: 301Ah) [0]) and the clock number in horizontal direction by the HMAX [15:0] register (address 1Bh (I²C: 301Bh) [7:0], 1Ch (I²C: 301Ch) [7:0]). See the description of Operation Mode for details of the section of "Operating Modes".

Gain Adjustment Function

The Programmable Gain Control (PGC) of this device consists of the analog block and digital block. The total of analog gain and digital gain can be set up to 48 dB by the GAIN [7:0] register (address 14h (I²C: 3014h) [7:0]) setting. The same setting is applied in all colors.

See the List of Gain Setting Register Value for Each Register.

Black Level Adjustment Function

The black level offset (offset variable range: 000h to 1FFh) can be added relative to the data in which the digital gain modulation was performed by the BLKLEVEL [8:0] register (address: 0Ah (I²C: 300Ah) [7:0], 0Bh (I²C: 300Bh) [0]). When the BLKLEVEL setting is increased by 1 LSB, the black level is increased by 1 LSB.

Use with values shown below is recommended.

10-bit output: 03Ch (60d)

12-bit output: 0F0h (240d)

List of Black Level Adjustment Register

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
BLKLEVEL [8:0]	BLKLEVEL [7:0]	0Ah (300Ah)	[7:0]	0F0h	000h to 1FFh
	BLKLEVEL [8]	0Bh (300Bh)	[0]		

Vertical Normal Operation and Inverted Drive

The sensor readout direction (normal/inverted) in vertical direction can be switched by the VREVERSE (address 07h (I²C: 3007h) [0]) register setting. See the section of “Operating Modes” for the order of readout lines in normal and inverted modes. One invalid frame is generated when reading immediately after the readout direction change in order to switch the normal operation and inversion between frames.

List of Vertical Drive Direction Setting Register

Shutter and Integration Time Settings

This sensor has a variable electronic shutter function that can control the integration time in line units. In addition, this sensor performs rolling shutter operation in which electronic shutter and readout operation are performed sequentially for each line.

Note) For integration time control, an image which reflects the setting is output from the frame after the setting changes.

Example of Integration Time Setting

The sensor's integration time is obtained by the following formula.

$$\text{Integration time} = 1 \text{ frame period} - (\text{SHS1} + 1) \times (1\text{H period}) + t_{\text{OFFSET}}$$

- Note) 1. The frame period is determined by the input XVS when the sensor is operating in slave mode, or the register VMAX value in master mode. The frame period is designated in 1H units, so the time is determined by (Number of lines × 1H period).
 2. See "Operating Modes" for the 1H period.
 3. t_{OFFSET} is 2.64 [μs] (10 bit output) or 3.85 [μs] (12 bit output).

In this item, the shutter operation and storage time are shown as in the figure below with the time sequence on the horizontal axis and the vertical address on the vertical axis. For simplification, shutter and readout operation are noted in line units.

Image Drawing of Shutter Operation

TENTATIVE

Normal Exposure Operation (Controlling the Integration Time in 1H Units)

The integration time can be controlled by varying the electronic shutter timing. In the electronic shutter settings, the integration time is controlled by the SHS1 [16:0] register (address: 20h (I²C: 3020h) [7:0], 21h (I²C: 3021h) [7:0], 22h (I²C: 3022h) [0]).

Set SHS1 [16:0] to a value between 0 and (Number of lines per frame - 2). When the sensor is operating in slave mode, the number of lines per frame is determined by the XVS interval (number of lines), using the input XHS interval as the line unit.

When the sensor is operating in master mode, the number of lines per frame is determined by the VMAX register (address: 18h (I²C: 3018h) [7:0], 19h (I²C: 3019h) [7:0], 1Ah (I²C: 301Ah) [0]).

The number of lines per frame differs according to the operating mode.

Registers Used to Set the Integration Time in 1H Units

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
SHS1 [16:0]	SHS1 [7:0]	20h (3020h)	[7:0]	00000h	Set the shutter sweep time. 0 to (Number of lines per frame - 2) (Number of lines per frame - 1) : Setting prohibited
	SHS1 [15:8]	21h (3021h)	[7:0]		
	SHS1 [16]	22h (3022h)	[0]		
VMAX [16:0]	VMAX [7:0]	18h (3018h)	[7:0]	00465h	Set the number of lines per frame (only in master mode). See "Operating Modes" for the setting value in each mode.
	VMAX [15:8]	19h (3019h)	[7:0]		
	VMAX [16]	1Ah (301Ah)	[0]		

Image Drawing of Integration Time Control within a Frame

TENTATIVE

Long Exposure Operation (Control by Expanding the Number of Lines per Frame)

Long exposure operation can be performed by lengthening the frame period.

When the sensor is operating in slave mode, this is done by lengthening the input vertical sync signal (XVS) pulse interval.

When the sensor is operating in master mode, it is done by designating a larger register VMAX [16:0] (address: 18h (I²C: 3018h) [7:0], 19h (I²C: 3019h) [7:0], 1Ah (I²C: 301Ah) [0]) value compared to normal operation.

When the integration time is extended by increasing the number of lines, the rear V blanking increases by an equivalent amount.

The maximum VMAX value is 131071d, and the maximum SHS1 value is 131069d. When the number of lines per frame is set to the maximum value, the integration time in 1080p-HD mode at 120 frame/s is approximately 1 s. When set to a number of V lines or more than that noted for each operating mode, the imaging characteristics are not guaranteed during long exposure operation.

Image Drawing of Long Integration Time Control by Adjusting the Frame Period

TENTATIVE

Example of Integration Time Settings

The example of register setting for controlling the storage time is shown below.

Example of Integration Time Setting (2.3 M pixels in all-pixel mode at 100 frame/s)

Operation	Sensor setting (register)		Integration time
	VMAX*	SHS1**	
Normal frame rate	1320	1318	1H + t _{OFFSET}
		⋮	⋮
		N	(1320 - (N + 1)) H + t _{OFFSET}
		⋮	⋮
		1	1318H + t _{OFFSET}
		0	1319H + t _{OFFSET}
Long-time exposure operation	M	N	(M - (N + 1)) H + t _{OFFSET}

* In sensor master mode. In slave mode, the interval is same as XVS input.

** The SHS1 setting value (N) is set between "0" and "the VMAX value (M) - 2".

Inc. Only

Signal Output

Output Pin Settings

The output formats of this sensor support the following modes.

- Low voltage LVDS parallel DDR output
- Low voltage LVDS serial (2 ch / 4 ch switching) DDR output
- CSI-2 serial data output (2 Lane / 4 Lane, RAW10/RAW12 output)

The switching is made by the OMODE pin. Establish the OMODE pin status before canceling the system reset. (Do not switch this pin status during operation.)

Settings OMODE pin for Output Format

Pin name	Pin processing	Operation mode	Remarks
OMODE pin	High fixed	Low voltage LVDS parallel DDR output / Low voltage LVDS serial DDR output	High: OV _{DD} Low: GND
	Low fixed	CSI-2 serial data output	

Each mode is set using the register OPORTSEL [3:0] (Address: 44h (I²C: 3044h) [7:4]). The table below shows the output format settings.

Settings Register for Output Format

Register name	Register details (Chip ID = 02h)		Initial value	Setting value	Description
	Address (): I ² C	bit			
OPORTSEL [3:0]	44h (3044h)	[7:4]	Eh	6h	Low voltage LVDS parallel DDR output
				Dh	Low voltage LVDS serial 2 ch DDR output
				Eh	Low voltage LVDS serial 4 ch DDR output / CSI-2 serial data output

Each output pin is shown in the table below when setting low-voltage LVDS serial 2 ch/4 ch output.

Output Pins for Low voltage LVDS Serial mode

DOP/DOM	Low voltage LVDS serial DDR output	
	2 ch	4 ch
DOP11 to 8 / DOM11 to 8	Hi-Z	Hi-Z
DOP7 / DOM7	Hi-Z	CH4
DOP6 / DOM6	CH2	CH2
DOP5 / DOM5	CH1	CH1
DOP4 / DOM4	Hi-Z	CH3
DOP3 to 0 / DOM3 to 0	Hi-Z	Hi-Z

TENTATIVE

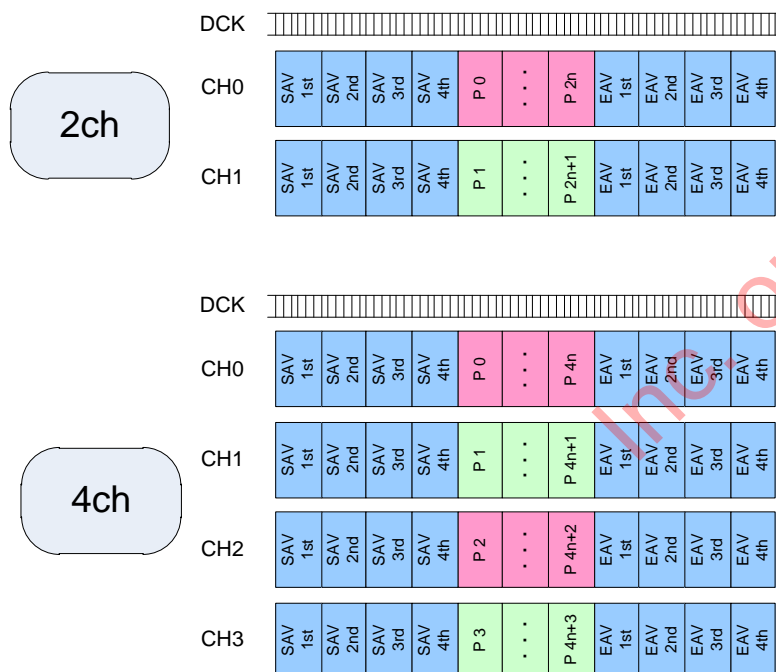

Low-voltage LVDS serial 2 ch/4 ch output format is shown in the figure below.

When setting 2 ch, after four data of SAV is output in the order of CH0 and CH1 pixel data is repeatedly output in the same order and then four data of EAV is output in the same order to CH0 and CH1 respectively.

When setting 4 ch, after four data of SAV is output in the order of CH0, CH1, CH2 and CH3 pixel data is repeatedly output in the same order and then four data of EAV is output in the same order to CH0, CH1, CH2 and CH3 respectively.

Data is sent MSB first.

For details, see drive timing in each mode in the section of "Operation Mode".

Output Format of Low voltage LVDS Serial 2 ch/4 ch

CSI-2 serial Output Setting

The output formats of this sensor support the following modes.

CSI-2 serial data output 2 Lane / 4 Lane, RAW10 / RAW12

The 2 Lane / 4 Lane serial signal output method using the IMX185LQJ is described below.

Complied with the CSI-2 Rev.1.0, data is output using 2 Lane / 4 Lane.

The image data is output from the CSI-2 output pin. The DMO1P/DMO1N are called the Lane1 data signal, the DMO2P/DMO2N are called the Lane2 data signal, the DMO3P/DMO3N are called the Lane3 data signal, the DMO4P/DMO4N are called the Lane4 data signal. In addition, the clock signals are output from DMCKP/DMCKN of the CSI-2 pins.

In 2 Lane mode, data is output from Lane1 and Lane2. In 4 Lane mode, data is output from Lane1, Lane2, Lane3 and Lane4. The bit rate maximum value is 444.5 Mbps/Lane.

The select of RAW10 / RAW12 is set by the register: CSI_DT_FMT [15:0] (address: (Chip ID05h) : 3Eh (I²C : 333Eh) [7:0], 3Fh (I²C : 333Fh) [7:0]).

The number of output lanes is set by the register: CSI_Lane_MODE [1:0] (address: (Chip ID05h) : 40h (I²C: 3340h) [1:0]). The number of lanes physically connected is set by PHYSICAL_Lane_NUM [1:0] (address: (Chip ID05h) : 05h (I²C: 3305h) [1:0]).

Unused lanes (when setting 2 lanes; DMO3P/DMO3N, DMO4P/DMO4N) are set to Hi-Z output by the setting. When the number of lanes more than CSI_Lane_MODE is set by PHYSICAL_Lane_NUM, unused lanes output signals conformed to MIPI standard.

Settings for Output Format

Register name	Register details (Chip ID = 05h)			Initial value	Setting value	Function	Remarks
	Register	Address () : I ² C	bit				
CSI_DT_FMT [15:0]	CSI_DT_FMT [7:0]	3Eh (333Eh)	[7:0]	0C0Ch	0A0Ah	RAW10	
	CSI_DT_FMT [15:8]	3Fh (333Fh)	[7:0]		0C0Ch	RAW12	
PHYSICAL_Lane_NUM [1:0]	—	05h (3305h)	[1:0]	3	1	2 Lane	0,2: Setting prohibited
					3	4 Lane	
CSI_Lane_MODE [1:0]	—	40h (3340h)	[1:0]	3	1	2 Lane	0,2: Setting prohibited
					3	4 Lane	

The formats of RAW12 and RAW10 are shown below.

→ RAW12 Format

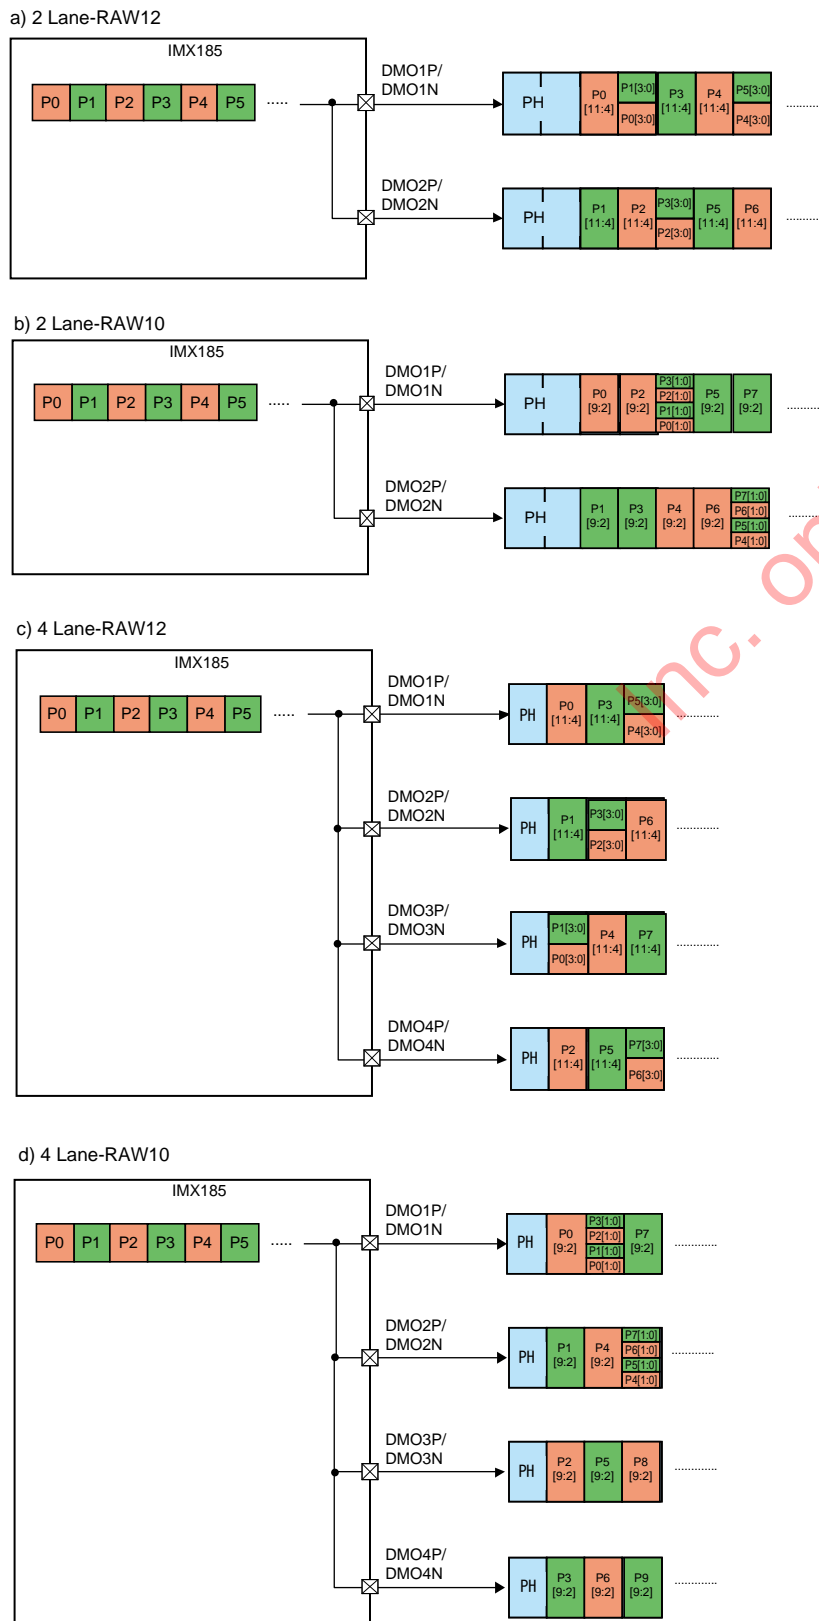

→ RAW10 Format

TENTATIVE

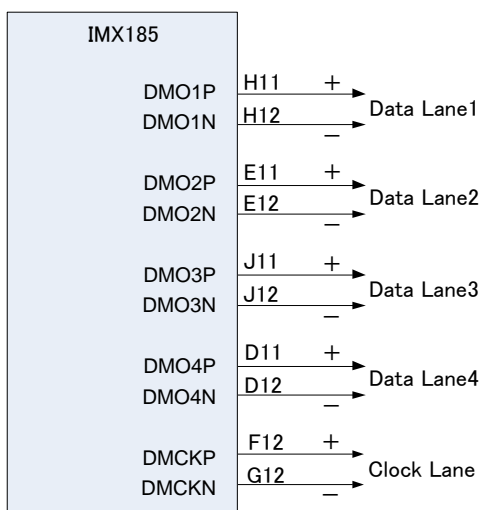

The each format of 2 Lane and 4 Lane are shown below.

Output Format of 2 Lane / 4 Lane

MIPI Transmitter

Output pins (DMO1P, DMO1N, DMO2P, DMO2N, DMO3P, DMO3N, DMO4P, DMO4N, DMCKP, DMCKN) are described in this section.

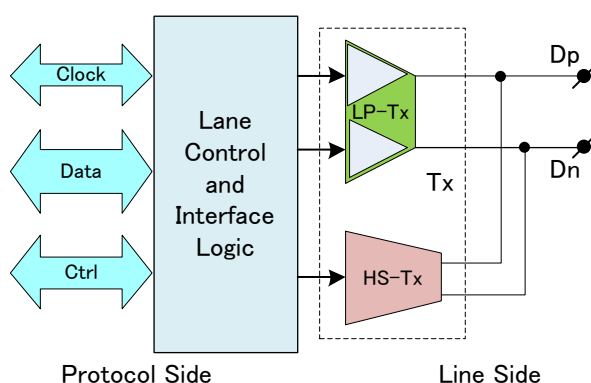

Relationship between Pin Name and MIPI Output Lane

The pixel signals are output by the CSI-2 High-speed serial interface. See the MIPI Standard

- MIPI Alliance Standard for Camera Serial Interface 2 (CSI-2) Version 1.01.00
- MIPI Alliance Specification for D-PHY Version 0.90.00

The CSI-2 transfers one bit with a pair of differential signals. The transmitter outputs differential current signal after converting pixel signals to it. Insert external resistance in differential pair in a series or use cells with a built-in resistance on the Receiver side. When inserting an external resistor, as close as possible to the Receiver. The differential signals maintain a constant interval and reach the receiver with the shortest wiring length possible to avoid malfunction. The maximum bit rate of each Lane are 445.5 Mbps/Lane.

Universal Lane Module Functions

TENTATIVE

Output Pin Bit Width Selection (Low voltage LVDS output)

The output pin width can be selected from 10 bit or 12 bit output using the register ODBIT (address 44h (I²C: 3044h), bit [0]).

In parallel output mode, when ODBIT = 0 (10 bit output), the lower 2 bits are high impedance in low voltage LVDS output mode. Therefore, when using only 10 bit, the pins corresponding to the lower 2 bits can be left open on the board by setting ODBIT = 0.

When low voltage LVDS serial output, continuous data is output MSB first by 10 bit and 12 bit output setting respectively.

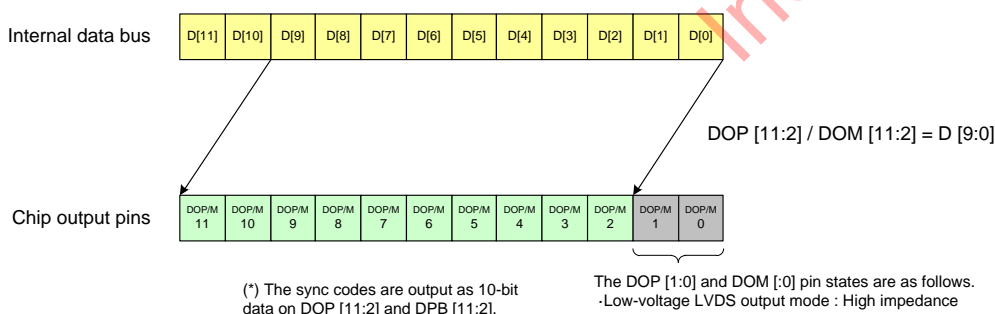

10 bits sync code are output when ODBIT = 0 (10 bit output), and 12 bit sync codes are output when ODBIT = 1 (12 bit output).

Output Pin Bit Width Selection Setting Register

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
ODBIT	—	44h (3044h)	[0]	1h	0: 10 bit 1: 12 bit

ODBIT = 0 (parallel 10 bit output)

The lower 10 bits of the internal data bus are output with left justified on the chip output pins DO.

Bit Assignments in Parallel 10 bit Output Mode

ODBIT = 1 (parallel 12 bit output)

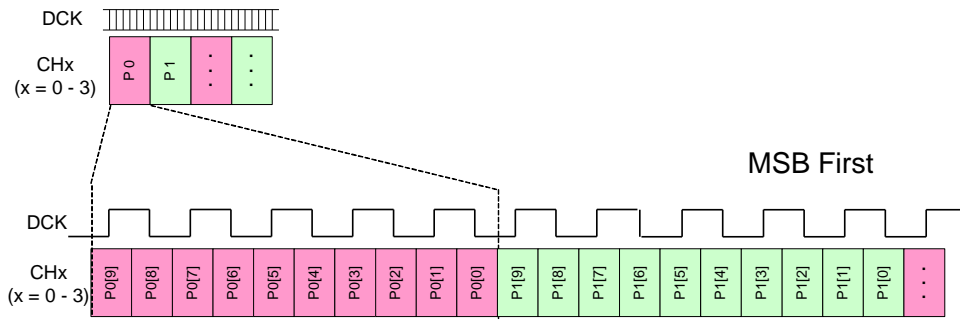

The lower 12 bits of the internal data bus are output on the chip output pins DO.

Bit Assignments in Parallel 12 bit Output Mode

TENTATIVE

ODBIT = 0 (low voltage LVDS serial 10 bit output)

Example of Data format in low voltage LVDS serial 10 bit output

ODBIT = 1 (low voltage LVDS serial 12 bit output)

Example of Data format in low voltage LVDS serial 12 bit output

TENTATIVE

Number of Internal A/D Conversion Bits Setting

The number of internal A/D conversion bits can be selected from 10 bit or 12 bit by the register ADBIT (address 05h (I²C: 3005h), bit [0]). See the section of "Operating Modes" for the correspondence with each mode.
12 bit right justified output is possible by setting 12 bit to only output width under the condition of ODBIT = 1 in the mode of ADBIT = 0 (10 bit setting).

In LVDS output mode, 12 bit right justified output is possible by setting 12 bit to only output width under the condition of ODBIT = 1 in the mode of ADBIT = 0 (10 bit setting).

Internal A/D Conversion Resolution Setting (LVDS / CSI-2 Output)

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address (): I ² C	bit		
ADBIT	—	05h (3005h)	[0]	1h	0: 10 bit 1: 12 bit

Inc. only

TENTATIVE

Output Bit Shift (Low voltage LVDS output)

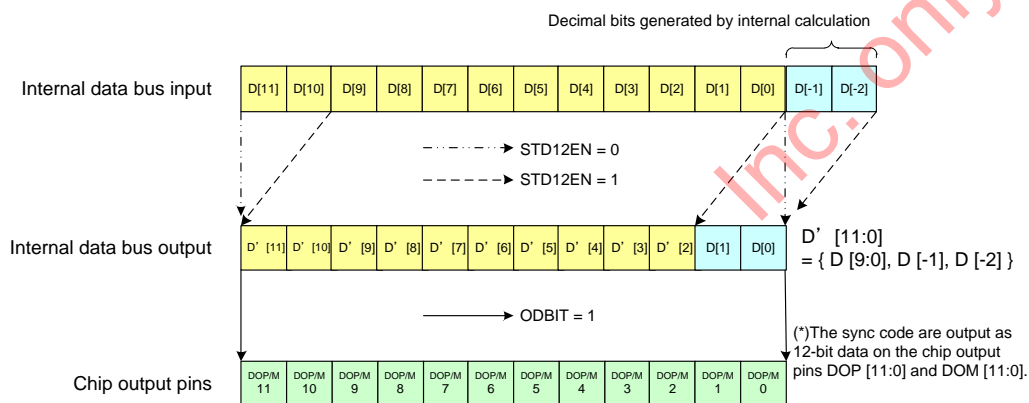

When internal A/D conversion is set to 10 bit mode (ADBIT = 0h), the sensor has a function that shifts the sensor internal 10 bit data by 2 bits to the MSB side and outputs by register STD12EN address 05h (I²C: 3005h), bit [4]. This time, the register ODBIT is set to 1 (12 bit output), 2 decimal bits generated by the internal calculation are output in the 2 LSB side bits.

The output consists of upper 10 bits (step accuracy) and lower 2 bits (remainder). The step accuracy is equivalent to 10 bit.

When the register STD12EN is set to 1 (bit shift), 12 bit sync codes are output on the chip output pins DOP [11:0] and DOM [11:0].

Bit Shift Setting Register

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
STD12EN	—	05h (3005h)	[4]	0h	0: No bit shift 1: 2 bits shift to MSB side

Bit Assignment when 12 bit Shift is Set

Output Rate Setting

The sensor output rate is determined uniformly by the sensor operating mode and the output format. See the section of “Operating Modes” for the relationship between each setting and the frame rate, data rate and data bit rate. The registers related to mode setting are shown in the table below.

Related Registers for Setting Operation Mode

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
MODE [5:0]	—	06h (3006h)	[5:0]	00h	00h: All-pix scan mode 33h: Horizontal / vertical 2/2-line binning readout mode Others: Setting prohibited
WINMODE [3:0]	—	07h (3007h)	[7:4]	1h	Window mode setting 0: WUXGA mode 1: 1080p mode 2: 720p mode 4: Window cropping mode (from WUXGA mode) 5: Window cropping mode (from 1080p mode) 6: Window cropping mode (from 720p mode)
FRSEL [1:0]	—	09h (3009h)	[1:0]	2h	Frame rate grade setting 0: High speed mode, 1: Middle speed mode, 2: Low speed mode 3: Setting prohibited See the detailed description in register list for each mode

Output Signal Range

In LVDS output mode, the sensor output has either a 10 bit or 12 bit gradation, but output is not performed over the full range, and the maximum output value is the (3FFh -1) value (10 bit output) and the (FFFh -1) one (12 bit output). When serial output, the minimum value is 001h. The output range for each output gradation is shown in the table below.

See the item of “Sync Codes” in the section of “Operating Modes” for the sync codes.

Output Gradation and Output Range (LVDS Output)

Output gradation	Output value		
	Min.		Max.
	Parallel output	Serial output	
10 bit	000h	001h	3FEh
12 bit	000h	001h	FFEh

In CSI-2 output mode, the sensor output has either a 10 bit or 12 bit gradation, but output is not performed over the full range, and the maximum output value is the 3FFh value (10 bit output) and the FFFh one (12 bit output). The output range for each output gradation is shown in the table below.

Output Gradation and Output Range (CSI-2 Output)

Output gradation	Output value	
	Min.	Max.
10 bit	000h	3FFh
12 bit	000h	FFFh

TENTATIVE

INCK Setting

The available operation mode varies according to INCK frequency. Input either 27 MHz or 54 MHz or 37.125 MHz or 74.25 MHz for INCK frequency. The value according to the combination of input INCK and output format is set to register INCKSEL1, INCKSEL2, INCKSEL3, INCKSEL4, INCKSEL5, INCK_FREQ and INCK_FREQ2.

Do not change these register values during sensor operation. These register should be set up at the power on sequence.

The register setting of INCK_FREQ and INCK_FREQ2 is only for CSI-2 output mode.

The INCK setting register and the list of INCK setting are shown in the table below.

INCK Setting Register (Low-voltage LVDS Parallel / Serial output)

Register name	Register details			Initial value	Low-voltage LVDS Parallel				Low-voltage LVDS Serial

Register Hold Setting

Register setting can be transmitted with divided to several frames and it can be reflected globally at a certain frame by the register REGHOLD (address: 01h (I2C: 3001h) [0]). Setting REGHOLD = 1 at the start of register communication period prevents the registers that are set thereafter from reflecting at the frame reflection timing. The registers that are set when setting REGHOLD = 1 are reflected globally by setting REGHOLD = 0 at the end of communication period of the desired frame to reflect the register.

Register Hold Setting Register

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
REGHOLD	—	01h (3001h)	[0]	0h	0: Invalid 1: Valid (register hold)

Register Hold Setting

Software Reset (Low voltage LVDS output)

This function is prohibited in CSI-2 output mode.

Software reset can be performed by register setting using the register SW_RESET (address: 03h (I²C: 3003h) [0]). Sensor reset is performed by setting SW_RESET = 1. However, the communication to continuous address cannot use. In I2C communication, sensor not return ACK when SW_RESET is transferred.

The registers become initial state and standby 500 ns after setting SW_RESET = 1. The SW_RESET signal returns to "0" automatically.

The XVS and XHS output High in master mode.

Input High to the XVS and XHS before setting SW_RESET = 1 in slave mode.

Follow the sequence in the item of "Standby Mode" to perform register initial setting and standby cancel from standby state.

Software Reset Register Setting

Register name	Register details (Chip ID = 02h)			Initial value	Setting value
	Register	Address () : I ² C	bit		
SW_RESET	—	03h (3003h)	[0]	0h	0: Normal operation 1: Reset

Software Reset

Mode Transitions (Low-voltage LVDS output)

When changing the operating mode during sensor drive operation, first set the sensor to all-pixel scan mode, and then it again to the desired operating mode.

An invalid frame is generated during mode transition.

An invalid frame is generated as well as when changing frame rate in the same operating mode.

The table below shows the number of invalid frames generated by transition between the various modes.

Data is output from sensor during the invalid frame period, but the output values may reflect the integration time or may not be uniform on the screen, or a partially saturated image may be output,

Operating mode (register MODE [5:0]) and frame rate grade setting (register FRSEL [1:0]) cannot be changed at the same time. They must be set at respective frames, and an invalid frame is generated in each mode transition.

In addition, especially when INCK frequency (register INCKSEL1-5), output bit width (register ODBIT) or output format (register OPORTSEL [3:0]) is changed, transition of the operating mode must be done via sensor standby.

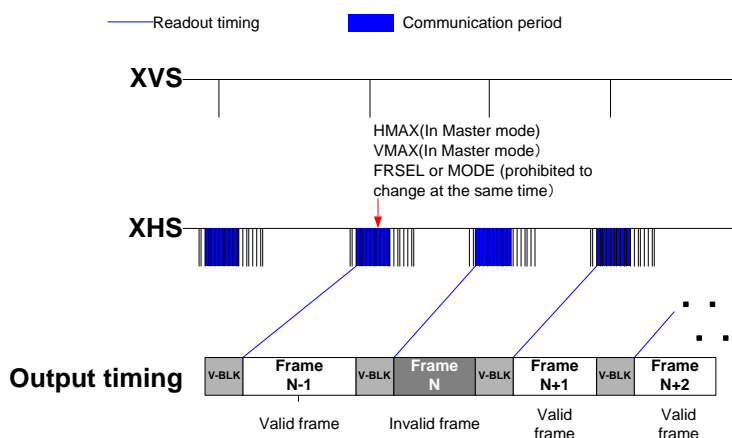

When INCK frequency is changed, care should be taken not to be input pulses whose width is shorter than the High/Low level width in front and behind of the INCK pulse at the frequency change.

If the pulses above generate at the frequency change, change INCK frequency during system reset in the state of XCLR = Low, and then perform system clear in the state of XCLR = High following the item of "Power on sequence" in the section of "Power on /off sequence". Execute initial setting again because the register settings become default state after system clear.

Number of Invalid Frames Generated during Mode Transitions

Mode transition		Number of invalid frames
All-pixel scan mode	→ 1080p-HD mode	1
All-pixel scan mode	→ Horizontal / vertical 2/2-line binning readout mode	
All-pixel scan mode	→ Window cropping mode	
1080p-HD mode	→ All-pixel scan mode	
Horizontal / vertical 2/2-line binning readout mode	→ All-pixel scan mode	
Window cropping mode	→ All-pixel scan mode	
All-pixel scan mode Horizontal / vertical 2/2-line binning readout mode 1080p-HD mode	→ Same operation mode Frame rate grade change (Note 1)	

(Note 1) Excluded when changing input INCK frequency or the register ODBIT or OPORTSEL [3:0].

Mode Transitions

TENTATIVE

Mode Transitions (CSI-2 Serial output)

When changing an operating mode during sensor drive, always start operation according to standby cancel sequence after changing the mode during the standby period via sensor standby.

Also when changing the number of Lanes, frame rate and cropping size in Window cropping mode during the same mode, always start operation via sensor standby.

In addition, especially when INCK frequency (register INCKSEL1-5, INCK_FREQ and INCK_FREQ2) is changed, transition of the operating mode must be done via sensor standby.

When INCK frequency is changed, care should be taken not to be input pulses whose width are shorter than the High/Low level width in front and behind of the INCK pulse at the frequency change.

If the pulses above generate at the frequency change, change INCK frequency during system reset in the state of XCLR = Low, and then perform system clear in the state of XCLR = High following the item of "Power on sequence" in the section of "Power on / off sequence". Execute initial setting again because the register settings become default state after system clear.

Inc. only

Power-on and Power-off Sequences

Power-on Sequence

Follow the sequence below to turn on the power supplies.

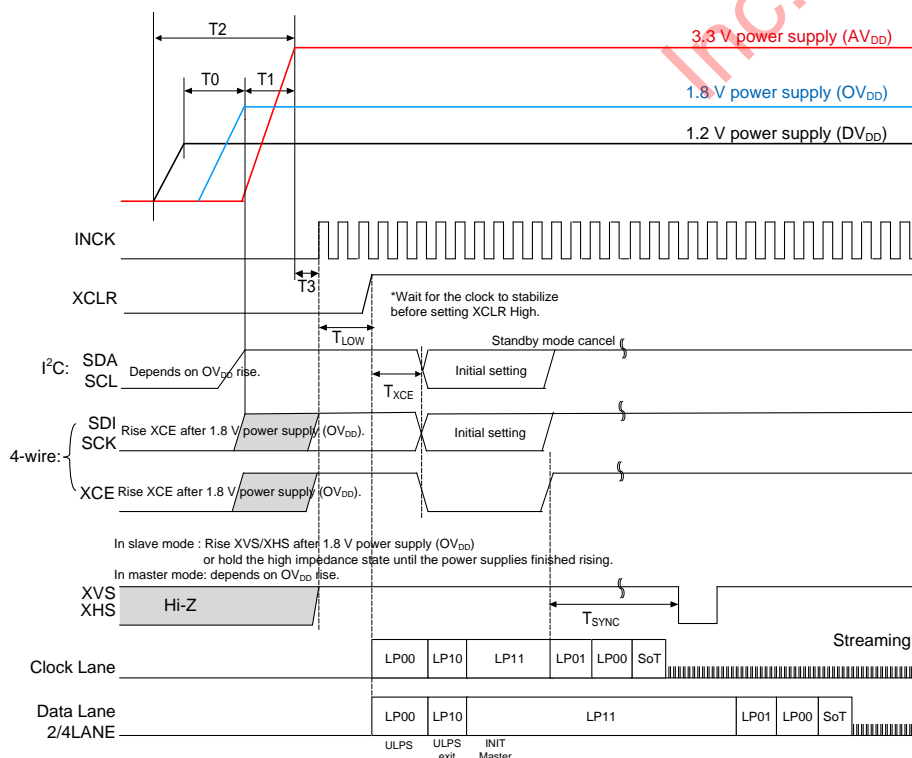

- (1) Turn on the power supplies so that the power supplies rise in order of 1.2 V power supply (DV_{DD}) → 1.8 V power supply (OV_{DD}) → 3.3 V power supply (AV_{DD}). In addition, all power supplies should finish rising within 200 ms.
- (2) Start master clock (INCK) input after turning on the power supplies.
- (3) The register values are undefined just after Power-on, so the system must be cleared. Hold XCLR at Low level for 500 ns or more after all the power supplies have finished rising. (The register values after a system clear are the default values.)

In addition, hold XCE to High level during this period. Rise XCE after 1.8 V power supply (OV_{DD}), so hold XCE at High level until INCK is input.

The system clear is applied by setting XCLR to High level. However, the master clock needs to stabilize before setting the XCLR pin to High level.

After the system clear, Clock Lane (DCK) and Data Lane (Lane1 to 4) are LP00 state.

- (4) After 20 μs from the system clear, register communication can be set.
- (5) Make the sensor setting by register communication. In case of 4-wire serial control, a period of 20 μs or more should be provided after setting XCLR High before inputting the communication enable signal XCE. In case of I²C serial control, XCE is fixed to High level. After standby mode cancel, when the sensor drive slave mode, input XVS and XHS over 20 ms.

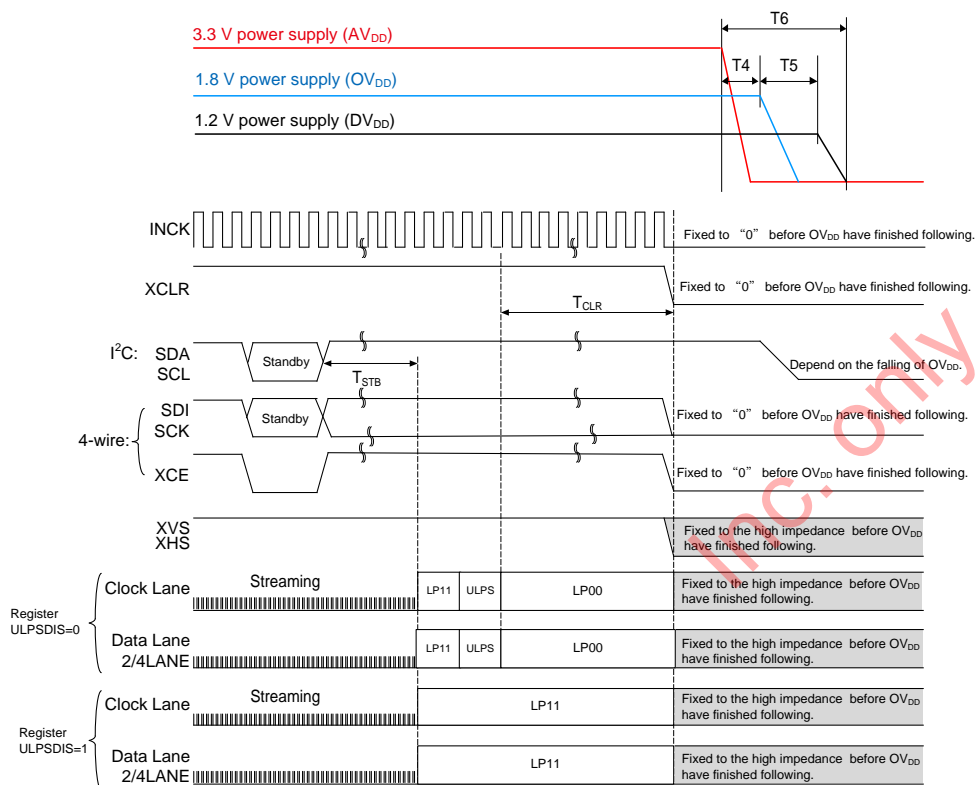

Power-on Sequence

Item	Symbol	Min.	Max.	Unit
1.2 V power supply rising → 1.8 V power supply rising	T ₀	0	—	ns
1.8 V power supply rising → 3.3 V power supply rising	T ₁	0	—	ns
Rising time of all power supply	T ₂	—	200	ms
All power supply rising → External input time of INCK	T ₃	0	—	ns
INCK active → Clear OFF	T _{LOW}	500	—	ns
Clear OFF → Communication start	T _{XCE}	20	—	μs
Standby OFF (communication) → External input XHS, XVS (slave mode only)	T _{SYNC}	20	—	ms

TENTATIVE

Power-off Sequence

Turn Off the power supplies so that the power supplies fall in order of 3.3 V power supply (AV_{DD}) → 1.8 V power supply (OV_{DD}) → 1.2 V power supply (DV_{DD}). In addition, all power supplies should finish falling within 200 ms. Set each digital input pin (INCK, XCE, SCK, SDI, XCLR, DMODE, XVS, XHS) to 0 V or high impedance before the 1.8 V power supply (OV_{DD}) falls.

Power –off Sequence

Item	Symbol	Min.	Max.	Unit
Standby ON (communication) → LP11 mode start	T_{STB}	Until FE		—
LP00 → XCLR falling (ULPSDIS = 0)	T_{CLR}	128	—	cycle
3.3 V power shut down → 1.8 V power shut down	T_4	0	—	ns
1.8 V power shut down → 1.2 V power shut down	T_5	0	—	ns
Shut down time of all power supply.	T_6	—	200	ms

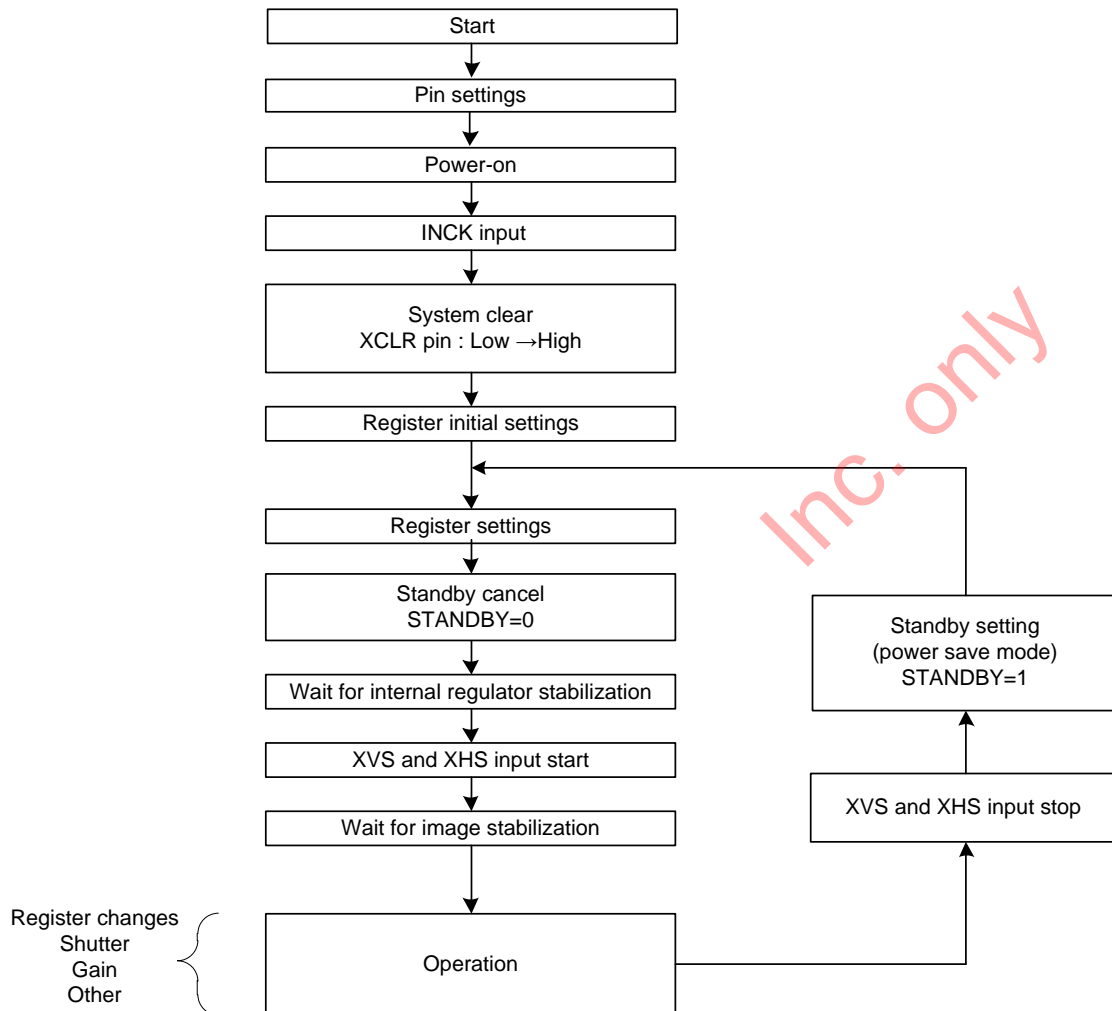

Sensor Setting Flow

Setting Flow in Sensor Slave Mode

The figure below shows operating flow in sensor slave mode.

For details of "Power on" to "Reset cancel", see the item of "Power on sequence" in this section.

"Standby setting (power save mode) can be made by setting the STANDBY register to "1" during "Operation".

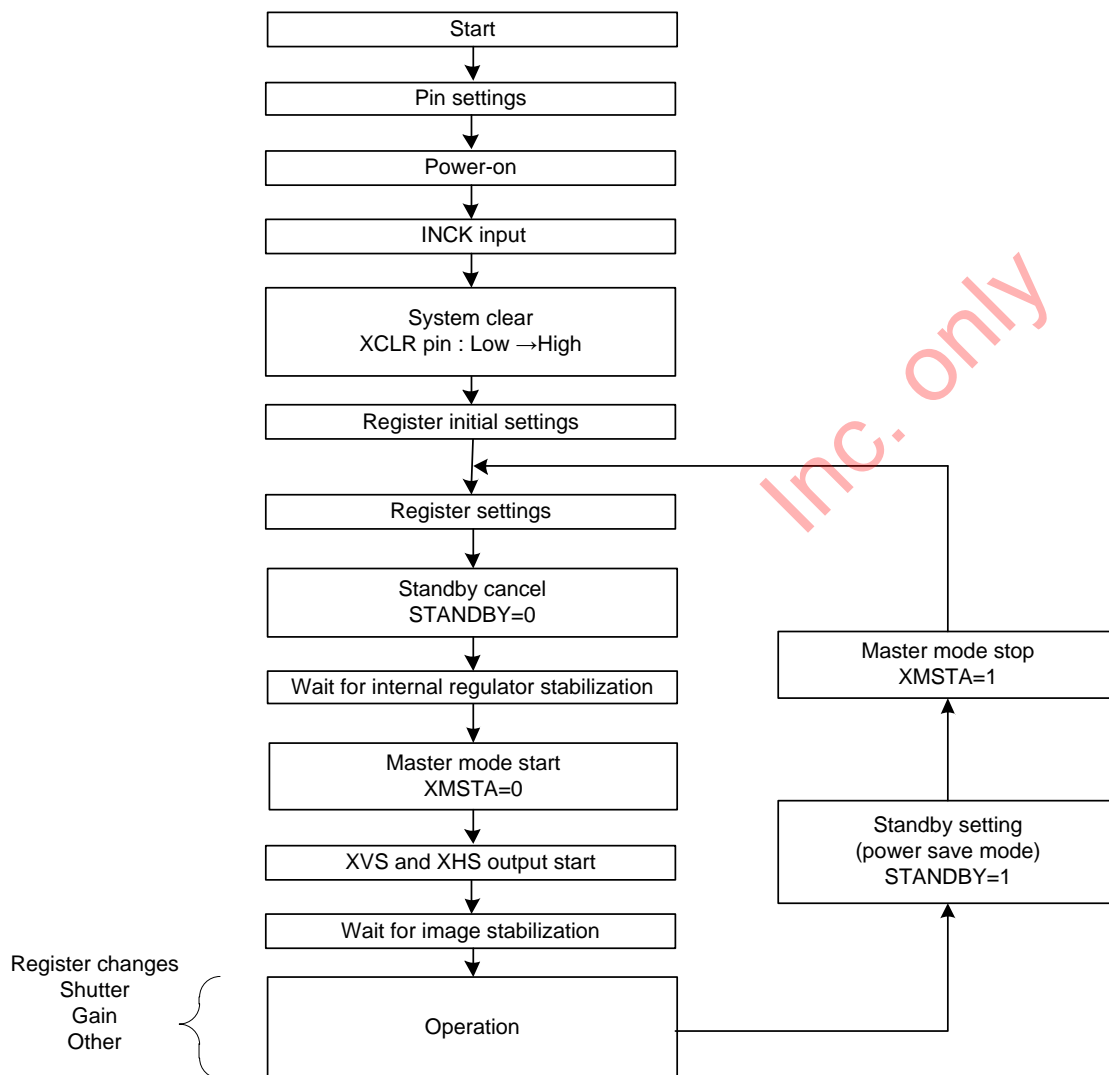

Sensor Setting Flow (Sensor Slave Mode)

TENTATIVE

Setting Flow in Sensor Master Mode

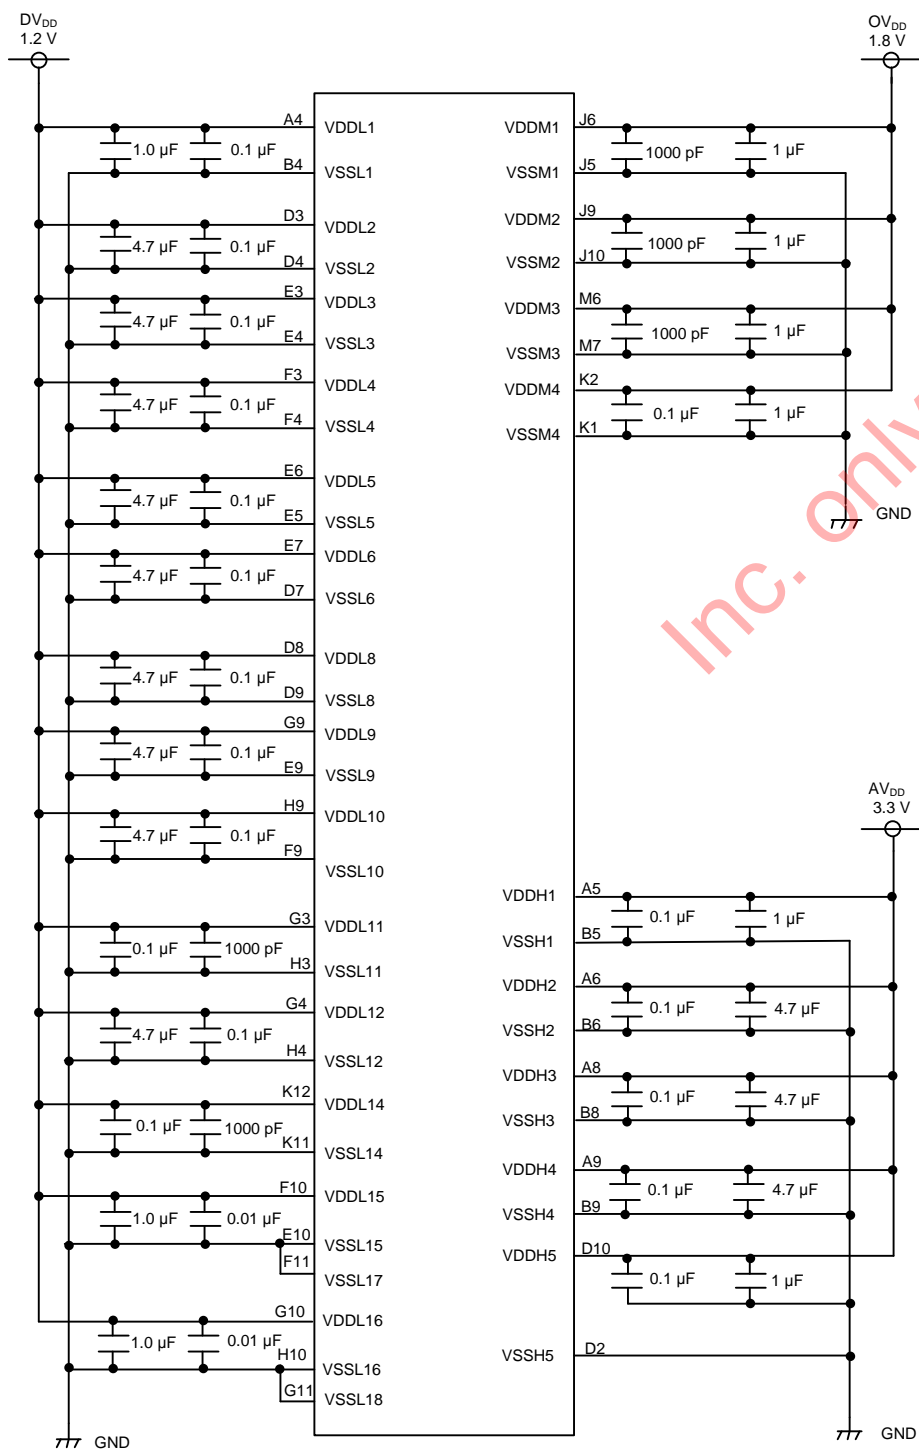

The figure below shows operating flow in sensor slave mode.
 For details of "Power on" to "Reset cancel", see the item of "Power on sequence" in this section.
 In master mode, "Master mode start" by setting the master mode start register XMSTA to "0" after "Waiting for internal regulator stabilization"
 "Standby setting (power save mode)" can be made by setting the STANDBY register to "1" during "Operation". This time, set "master mode stop" by setting XMSTA to "1".

Zone Definition

Notice on White Pixels Specifications

After delivery inspection of CMOS image sensors, cosmic radiation may distort pixels of CMOS image sensors, and then distorted pixels may cause white point effects in dark signals in picture images. (Such white point effects shall be hereinafter referred to as "White Pixels".) Unfortunately, it is not possible with current scientific technology for CMOS image sensors to prevent such White Pixels. It is recommended that when you use CMOS image sensors, you should consider taking measures against such White Pixels, such as adoption of automatic compensation systems for White Pixels in dark signals and establishment of quality assurance standards. Unless the Seller's liability for White Pixels is otherwise set forth in an agreement between you and the Seller, Sony Corporation or its distributors (hereinafter collectively referred to as the "Seller") will, at the Seller's expense, replace such CMOS image sensors, in the event the CMOS image sensors delivered by the Seller are found to be to the Seller's satisfaction, to have over the allowable range of White Pixels as set forth as set forth above under the heading "Spot Pixels Specifications", within the period of three months after the delivery date of such CMOS image sensors from the Seller to you; provided that the Seller disclaims and will not assume any liability after if you have incorporated such CMOS image sensors into other products. Please be aware that Seller disclaims and will not assume any liability for (1) CMOS image sensors fabricated, altered or modified after delivery to you, (2) CMOS image sensors incorporated into other products, (3) CMOS image sensors shipped to a third party in any form whatsoever, or (4) CMOS image sensors delivered to you over three months ago. Except the above mentioned replacement by Seller, neither Sony Corporation nor its distributors will assume any liability for White Pixels. Please resolve any problem or trouble arising from or in connection with White Pixels at your costs and expenses.

[For Your Reference] The Annual Number of White Pixels Occurrence

The chart below shows the predictable data on the annual number of White Pixels occurrence in a single-story building in Tokyo at an altitude of 0 meters. It is recommended that you should consider taking measures against the annual White Pixels, such as adoption of automatic compensation systems appropriate for each annual number of White Pixels occurrence.

The data in the chart is based on records of past field tests, and signifies estimated number of White Pixels calculated according to structures and electrical properties of each device. Moreover, the data in the chart is for your reference purpose only, and is not to be used as part of any CMOS image sensor specifications.

Example of Annual Number of Occurrence

White Pixel Level (in case of storage time = 1/30 s) (T _j = 60 °C)	Annual number of occurrence
5.6 mV or higher	7.2 pcs
10.0 mV or higher	4.7 pcs
24.0 mV or higher	2.4 pcs
50.0 mV or higher	1.4 pcs
72.0 mV or higher	1.1 pcs

Note 1) The above data indicates the number of White Pixels occurrence when a CMOS image sensor is left for a year.

Note 2) The annual number of White Pixels occurrence fluctuates depending on the CMOS image sensor storage environment (such as altitude, geomagnetic latitude and building structure), time (solar activity effects) and so on. Moreover, there may be statistic errors. Please take notice and understand that this is an example of test data with experiments that have being conducted over a specific time period and in a specific environment.

Note 3) This data does not guarantee the upper limits of the number of White Pixels occurrence.

For Your Reference:

The annual number of White Pixels occurrence at an altitude of 3,000 meters is from 5 to 10 times more than that at an altitude of 0 meters because of the density of the cosmic rays. In addition, in high latitude geographical areas such as London and New York, the density of cosmic rays increases due to a difference in the geomagnetic density, so the annual number of White Pixels occurrence in such areas approximately doubles when compared with that in Tokyo.

Measurement Method for Spot Pixels

After setting to standard imaging condition II, and the device driver should be set to meet bias and clock voltage conditions. Configure the drive circuit according to the example and measure.

1. Black or white pixels at high light

After adjusting the luminous intensity so that the average value V_G of the Gb / Gr signal outputs is 1120 mV, measure the local dip point (black pixel at high light, V_{iB}) and peak point (white pixel at high light, V_{iK}) in the Gr / Gb / R / B signal output V_i ($i = Gr / Gb / R / B$), and substitute the value into the following formula.

$$\text{Spot pixel level } D = ((V_{iB} \text{ or } V_{iK}) / \text{Average value of } V_i) \times 100 [\%]$$

Signal output waveform of R / G / B channel

2. White pixels in the dark

Set the device to a dark setting and measure the local peak point of the signal output waveform, using the average value of the dark signal output as a reference.

3. Black pixels at signal saturated

Set the device to operate in saturation and measure the local dip point, using the OB output as a reference.

Signal output waveform of R/G/B channel

Spot Pixel Pattern Specifications

White Pixel, Black Pixel and Bright Pixel are judged from the pattern whether they are allowed or rejected, and counted.

List of White Pixel, Black Pixel and Bright Pixel Pattern

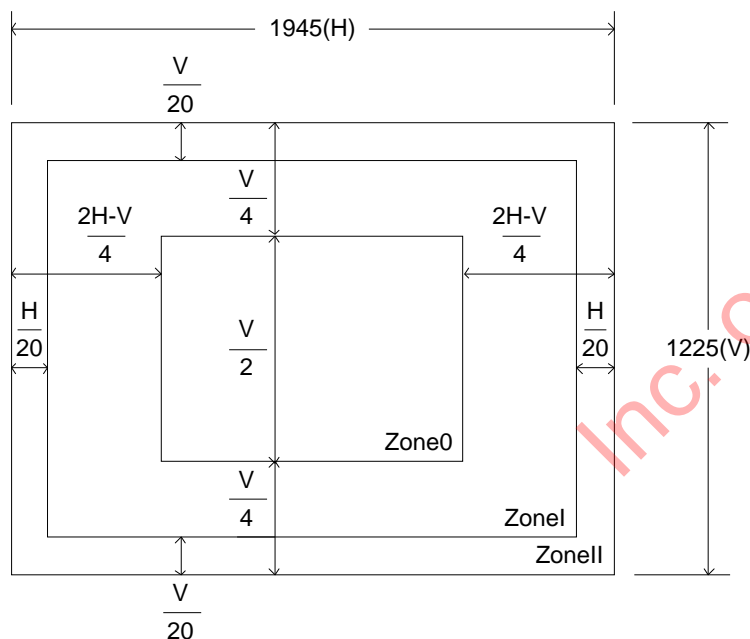

No.	Pattern  Specified in the left pixel array	White pixel	Black pixel	Bright pixel
1	 Same color	Rejected	Rejected	Rejected
2	 Same color	Rejected	Rejected	Rejected
3	 Different color	Allowed	Allowed	Allowed
4	 Same color	Rejected	Allowed	Allowed
5	 Different color	Allowed	Allowed	Allowed

- Note) 1. “●” shows the position of white pixel, black pixel and bright pixel.
 White pixel, black pixel and bright pixel are specified separately according the pattern.
 (Example: If a black pixel and a white pixel is in the pattern No.1 respectively, they are not judged to be rejected.)
- When one or more spot pixels indicated “Rejected” is selected and removed.
 - Spot pixels indicated “Allowed” are not the subject of selected rejection. They are counted including the number of allowable spot pixels by zone.
 - Spot pixels other than described in the table above are all counted including the number of allowable spot pixels by zone.

Stain Specifications

Zone	Allowable pixels	Size	Level	Lens aperture
0 to II	0	$L \geq 3$	$R \geq 8\%$	$F = 16$
Means no stain over 3 lines or more.				

Stain Zone Definition

Stain Measurement Method

In the following measurement, set the measurement condition to the standard imaging condition II, set the lens diaphragm to F16, and adjust the luminous intensity so that the average value of the G channel signal output is 1120 mV. Measure the local dip in the average value of the R / G / B channel signal output (V_{iBL}), and then calculate the stain level (R) as the ratio of V_{iBL} to the average value of the R/G/B channel signal output (V_i).

$$\text{Stain level } R = (V_{iBL} / V_i) \times 100 [\%] \quad (i = R, G, B)$$

At the same time, the size (L) of the area where the stain level is 8 % or more is determined by line number conversion.

The distance from one center of a stain to another is the stain interval, and is also determined in the same way by line number conversion.

Signal output waveform of R/G/B channel

 W: In English upper case character, One character
 X: Number, single number

DRAWING No. AM-B185LQJ (2D)

Notes On Handling

1. Static charge prevention

Image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- (1) Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- (2) Use a wrist strap when handling directly.
- (3) Install grounded conductive mats on the floor and working table to prevent the generation of static electricity.
- (4) Ionized air is recommended for discharge when handling image sensors.
- (5) For the shipment of mounted boards, use boxes treated for the prevention of static charges.

2. Protection from dust and dirt

Image sensors are packed and delivered with care taken to protect the element glass surfaces from harmful dust and dirt. Clean glass surfaces with the following operations as required before use.

- (1) Perform all lens assembly and other work in a clean environment (class 1000 or less).
- (2) Do not touch the glass surface with hand and make any object contact with it.
If dust or other is stuck to a glass surface, blow it off with an air blower.
(For dust stuck through static electricity, ionized air is recommended.)
- (3) Clean with a cotton swab with ethyl alcohol if grease stained. Be careful not to scratch the glass.
- (4) Keep in a dedicated case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- (5) When a protective tape is applied before shipping, remove the tape applied for electrostatic protection just before use. Do not reuse the tape.

3. Installing (attaching)

- (1) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package.
Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.
- (2) The adhesive may cause the marking on the rear surface to disappear.
- (3) If metal, etc., clash or rub against the package surface, the package may chip or fragment and generate dust.
- (4) Acrylate anaerobic adhesives are generally used to attach this product. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives to hold the product in place until the adhesive completely hardens. (Reference)
- (5) Note that the sensor may be damaged when using ultraviolet ray and infrared laser for mounting it.

TENTATIVE

4. Recommended reflow soldering conditions

The following items should be observed for reflow soldering.

(1) Temperature profile for reflow soldering

Control item	Profile (at part side surface)
1. Preheating	150 to 180 °C 60 to 120 s
2. Temperature up (down)	+4 °C/s or less (- 6 °C/s or less)
3. Reflow temperature	Over 230 °C 10 to 30 s Max. 5 °C/s
4. Peak temperature	Max. 240 ± 5 °C

(2) Reflow conditions

- Make sure the temperature of the upper surface of the seal glass resin adhesive portion of the package does not exceed 245 °C.
- Perform the reflow soldering only one time.
- Finish reflow soldering within 72 h after unsealing the degassed packing.
Store the products under the condition of temperature of 30 °C or less and humidity of 70 % RH or less after unsealing the package.
- Perform re-baking only one time under the condition at 125 °C for 24 h.

(3) Others

- Carry out evaluation for the solder joint reliability in your company.
- After the reflow, the paste residue of protective tape may remain around the seal glass.
(The paste residue of protective tape should be ignored except remarkable one.)
- Note that X-ray inspection may damage characteristics of the sensor.

5. Others

- Do not expose to strong light (sun rays) for long periods, as the color filters of color devices will be discolored.
- Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or use in such conditions.
- This product is precision optical parts, so care should be taken not to apply excessive mechanical shocks or force.
- Note that imaging characteristics of the sensor may be affected when approaching strong electromagnetic wave or magnetic field during operation.
- Note that image may be affected by the light leaked to optical black when using an infrared cut filter that has transparency in near infrared ray area during shooting subjects with high luminance.

Package Outline

(Unit: mm)

128Pin LGA

- 1) "A" is the center of the effective image area
 - 2) The two points "B" of the package are the horizontal reference
 - 3) The point "B'" of the package is the vertical reference
 - 4) The bottom "C" of the package is the height reference
 - 5) Base level "S" is a virtual flat surface calculated at three points (A12, N1, N12) of back side terminal
 - 6) The center of the effective image area relative to "B" and "B'" is (H, V) = (7.500, 6.250) ± 0.075 mm
 - 7) The rotation angle of the effective image area relative to "H" and "V" is ± 0.5°
 - 8) The height from the bottom "C" to the effective image area is 0.92 ± 0.1 mm
 - 9) The height from the top of cover glass "D" to the effective image area is 1.03 ± 0.1 mm
 - 10) The tilt of the effective image area relative to the bottom "C" is less than 0.05 mm
 - 11) The tilt of the effective image area relative to the bottom "D" of the cover glass is less than 0.05 mm
 - 12) The thickness of the cover glass is 0.750 mm, and the refractive index is 1.5
 - 13) As for standard for resin overflow in package outside, it shall be accepted up to outermost line tolerance of package.
 - 14) Below letter is appropriate in "W" ~ "Z". (Plating pre-emption)
- W : English Capital letter . single letter . X : Number . single letter .
 Y : Number . single letter . Z : Number . single letter .
 15) Up to 5 Indexes are arranged in "a" part.
