## LOCAL DIMMING 24x4 MATRIX LED DRIVER

April 2023

### GENERAL DESCRIPTIONS

IS31FL3749 is a matrix LED driver with 24 high voltage (16V) constant current channels. It supports from one to four power scan to become a 24x n (n=1~4) matrix LED driver. Each LED can be pulse width modulated (PWM) with maximum 16-bit precision for smooth LED brightness control. In addition, each LED can be controlled by an 8-bit output current control register (Dot correction, current scale, SL), which allows fine tuning the current for rich RGB color mixing, e.g., a pure white color LED application. The maximum output current of each channel is designed to be 60mA, which can be adjusted by three 8-bit global control registers group (one group for R for CS 3x n, one group for G for channels 3x n+1, and one group for B for channels 3x n+2, n=0~7, for example: one group for R is CS0,CS3,.....CS18,CS21 one group for G is CS1,CS4,.....CS19,CS22 one group for B is CS2,CS5,.....CS20,CS23). Proprietary algorithms are used in IS31FL3749 to minimize power bus noise caused by passive components on the power bus such as MLCC decoupling capacitor. All registers can be programmed via VSB (video series bus, up to 33MHz) or SPI (up to 33MHz) bus.

IS31FL3749 can be turned off with minimum current consumption by either pulling the SDB pin low or by using the software shutdown feature. It internally generates 4.8V VLDOOUT to power the internal logic operation (VCC), which can also be external powered from 3V to 5.5V.

IS31FL3749 is available in QFN-48(6mm x 6mm) package and can work over temperature range from -40°C to +125°C.

### FEATURES

- Support 24 constant current channels, 60mA/ch
- Tolerate up to 20V, nominal operation voltage between 4.3V to 16V, multiple LED's can be connected in series
- Built-in LDO to generate 4.8V supply for internal logic (option to float it and use external power)
- Interface
  - VSB (video serial bus, 33MHz)
  - SPI (33MHz)
- Reset register reset all the registers to default
- Support 8-bit, 16-bit, 8+4-bit dithering and 8+8-bit dithering PWM mode
- Built-in Dot correction: 8-bit/dot
- 8-bit x 3 global current adjustment
- 4 groups delay to minimize the power ripple
- Support bi-directional read data output via DI
- PSW short protection
- Spread spectrum
- Programmable detection of open/short, detected LED and store detected LED information in registers for ease of manufacturing/debugging
- Low standby and sleep mode current
- For matrix scanning operation
  - Built-in de-ghosting circuit
  - Reduced inactive LED reverse bias to improve LED reliability
- Over temperature protection
- Operating temperature: -40°C to 125°C
- QFN-48 (6mm x 6mm) package
- RoHS & Halogen-Free Compliance
- TSCA Compliance

### APPLICATIONS

- Mini LED Back Light
- LED Back Light
- Center Information Display
- Cluster Display

## TYPICAL APPLICATION CIRCUITE

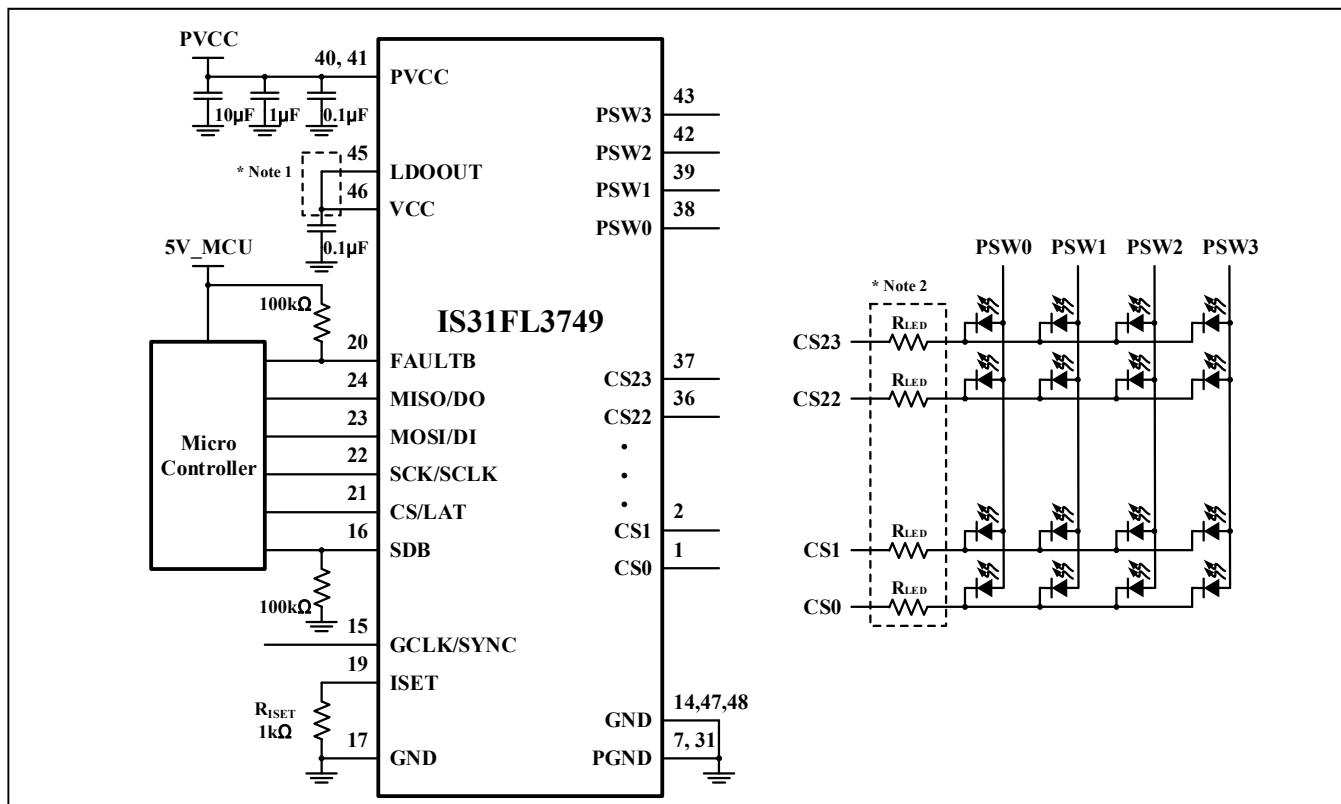

Figure 1 Typical Application Circuit: VSB/SPI Interface, 24×4 Array

# IS31FL3749

## TYPICAL APPLICATION CIRCUIT (CONTINUED)

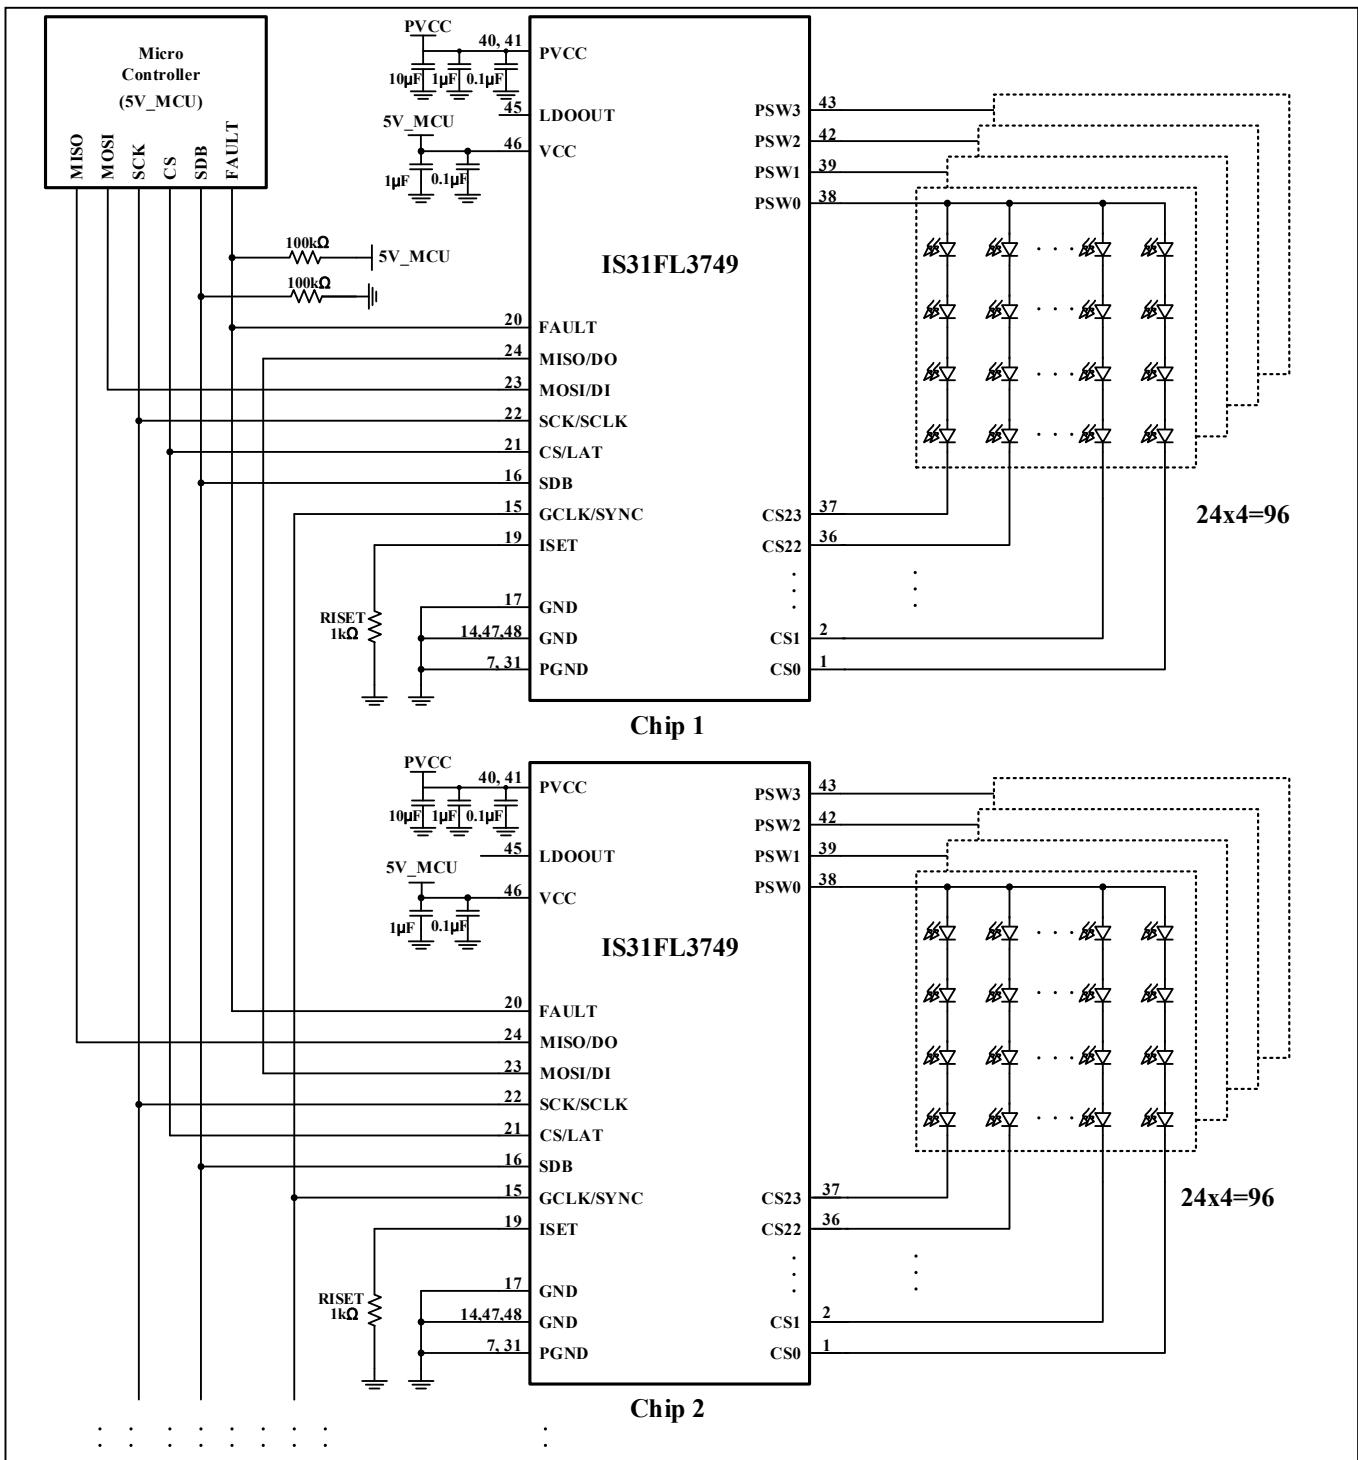

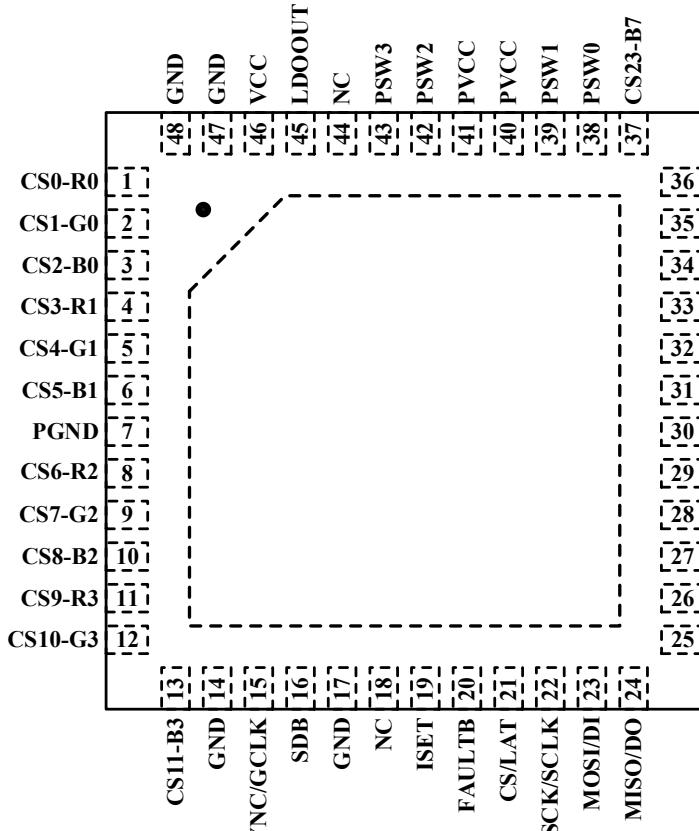

Figure 2 Typical Application Circuit-VSB/SPI (Cascade)

**Note 1:** LDOOUT can provide stable 4.8V power supply, which can directly supply power to VCC (LDOOUT is short to VCC). When LDOOUT is not used, LDOOUT pin can be float/NC.

**Note 2:** These optional resistors are for offloading the thermal dissipation ( $P=I^2R$ ) away from the IS31FL3749, it is determined by  $PV_{CC} \cdot I_{OUT} \cdot V_F$  of LED,  $V_{HR}$  of PSW $x$  and CS $y$ .  $R_{LED} = (PV_{CC} \cdot V_F - V_{HRSW} - V_{HRCs}) / I_{OUT}$ .

## PIN CONFIGURATION

Package	Pin Configuration (Top View)
QFN-48	

# IS31FL3749

## PIN DESCRIPTION

No.	Pin	Description
1~6,8~13, 25~30,32~37	CS[23:0]	Current sink pin for LED matrix.
7,31	PGND	Power GND.
14,17,47,48	GND	Analog GND.
15	SYNC/GCLK	Synchronization.
16	SDB	Shutdown pin.
18, 44	NC	Not connect.
19	ISET	Set the maximum $I_{OUT}$ current.
20	FAULTB	Fault report pin. Register DEh can read the function of the FAULTB pin and active low when the fault event happens. Can be NC (float) if fault function is not used.
21	CS / LAT	CS signal of SPI / Latch signal of VSB.
22	SCK / SCLK	SPI clock / VSB clock.
23	MOSI / DI	SPI input data / VSB input data.
24	MISO / DO	SPI output data / VSB output data.
38,39,42,43	PSW[3:0]	Power PSW.
40,41	PVCC	Power for current source PSWx.
45	LDOOUT	LDO output, 4.8V typical.
46	VCC	Analog and digital circuits.
	Thermal Pad	Connect to GND.

## ABSOLUTE MAXIMUM RATINGS

Supply voltage, $V_{CC}$	-0.3V ~ +6.0V
Supply voltage, $PV_{CC}$	-0.3V ~ +20V
Voltage at CSy pin	-0.3V ~ +20V
Voltage at any input pin	-0.3V ~ $PV_{CC}+0.3V$
Maximum junction temperature, $T_{JMAX}$	+150°C
Storage temperature range, $T_{STG}$	-65°C ~+150°C
Operating temperature range, $T_A=T_J$	-40°C ~ +150°C
Package thermal resistance, junction to ambient (4-layer standard test PCB based on JESD 51-2A), $\theta_{JA}$	37.4°C/W
ESD (HBM)	±3.5kV
ESD (CDM)	±750V

**Note 3:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

The following specifications apply for  $PV_{CC}= 12V$ ,  $V_{CC}= 5V$ ,  $T_A= 25^\circ C$ , unless otherwise noted.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$PV_{CC}$	Power supply voltage		4.3		16	V
$V_{CC}$	Supply voltage		3.0		5.5	V
$I_{CC}(PV_{CC})$	Quiescent power supply current	$R_{ISET}=1.0\text{k}\Omega$ , $PV_{CC}=12V$ , $V_{SDB}=V_{CC}=5V$ , $OSC=16\text{MHz}$ , all LEDs off		2	3	mA
$I_{CC}(V_{CC})$		$R_{ISET}=1.0\text{k}\Omega$ , $PV_{CC}=12V$ , $V_{SDB}=V_{CC}=5V$ , $OSC=16\text{MHz}$ , all LEDs off		8.0	9.0	mA
$I_{SD}(PV_{CC})$	Shutdown current	$PV_{CC}=12V$ , $V_{CC}=5V$ , $V_{SDB}=0V$ , $OSC=16\text{MHz}$		10	15	$\mu A$
$I_{SD}(V_{CC})$				2.5	3.5	$\mu A$
$I_{SD}(PV_{CC})$		$PV_{CC}=12V$ , $V_{SDB}=V_{CC}=5V$ , $SC=16\text{MHz}$ , $SSD=1$		450	500	$\mu A$
$I_{SD}(V_{CC})$				160	200	$\mu A$
$I_{OUT}$	Maximum constant current of CSy	$R_{ISET}=1\text{k}\Omega$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0xFF$ , $PWM=0xFFFF$ , $V_{OUT}=1V$	56.5	60	63.5	mA
$\Delta I_{MAT}$	Output current fault between outputs (Note 4)	$R_{ISET}=1\text{k}\Omega$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0xFF$ , $PWM=0xFFFF$ , $V_{OUT}=1V$	-5		5	%
$\Delta I_{ACC}$	Output current fault between devices (Note 5)	$R_{ISET}=1\text{k}\Omega$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0xFF$ , $PWM=0xFFFF$ , $V_{OUT}=1V$	-6		6	%
$V_{HR}$	Current Switch headroom voltage PSWx	$R_{ISET}=1\text{k}\Omega$ , $I_{PSWITCH}=0.8A$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0XFF$ , $PWM=0xFFFF$		0.4	0.65	V
		$R_{ISET}=1\text{k}\Omega$ , $I_{PSWITCH}=1.5A$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0XFF$ , $PWM=0xFFFF$ (Note 6)		0.65		
	Current sink headroom voltage CSy	$R_{ISET}=1\text{k}\Omega$ , $I_{SINK}=60\text{mA}$ , $GCCR=GCCG=GCCB=0xFF$ , $SL=0xFF$ , $PWM=0xFFFF$		0.3	0.4	
$t_{SCAN}$	Period of SWx scanning	OSC=16MHz, 16bits PWM Mode	3.5	4.096	4.5	ms
		OSC=16MHz, 8+8-bit/8+4-bit/8-bit PWM Mode	15.8	17.3	19.3	$\mu s$

## DIGITAL INPUT SPI SWITCHING CHARACTERISTICS (NOTE 6)

Symbol	Parameter	Min.	Typ.	Max.	Units
f <sub>C</sub>	Clock frequency	-		33	MHz
t <sub>CH</sub>	Clock high pulse duration	10			ns
t <sub>CL</sub>	Clock low pulse duration	10			ns
t <sub>SICH</sub>	MOSI to Clock rising edge setup time	5			ns
t <sub>CLCH</sub>	CS falling edge to Clock rising edge	33			ns
t <sub>CHSI</sub>	Clock rising edge to MOSI hold time	3			ns
t <sub>CLCH</sub>	Clock falling edge to CS rising edge hold time	10			ns
t <sub>CSH</sub>	CS high pulse duration	60			ns
t <sub>SOR</sub>	MISO rise time		3		ns
t <sub>SOF</sub>	MISO fall time		3		ns
t <sub>CHSO</sub>	Clock rising edge to MISO		30		ns

## DIGITAL INPUT VSB PSWITCHING CHARACTERISTICS (NOTE 6)

Symbol	Parameter	Min.	Typ.	Max.	Units
f <sub>C</sub>	Clock frequency	-		33	MHz
t <sub>CH</sub>	Clock high pulse duration	10			ns
t <sub>CL</sub>	Clock low pulse duration	10			ns
t <sub>DICH</sub>	DI to Clock rising edge setup time	5			ns
t <sub>LLCH</sub>	LAT falling edge to Clock rising edge	33			ns
t <sub>CHDI</sub>	Clock rising edge to DI hold time	3			ns
t <sub>CLLH</sub>	Clock falling edge to LAT rising edge hold time	10			ns
t <sub>LH</sub>	LAT high pulse duration	60			ns
t <sub>DOR</sub>	DO rise time		3		ns
t <sub>DOF</sub>	DO fall time		3		ns
t <sub>CHDO</sub>	Clock rising edge to DO		30		ns

**Note 4:** I<sub>OUT</sub> mismatch (bit to bit)  $\Delta I_{MAT}$  is calculated:

$$\Delta I_{MAT} = MAX \left( ABS \left( \frac{I_{OUTn}(n=0 \sim 23)}{\frac{I_{OUT0}+I_{OUT1}+\dots+I_{OUT23}}{24}} - 1 \right) \right) \times 100\%$$

**Note 5:** I<sub>OUT</sub> accuracy (device to device)  $\Delta I_{ACC}$  is calculated:

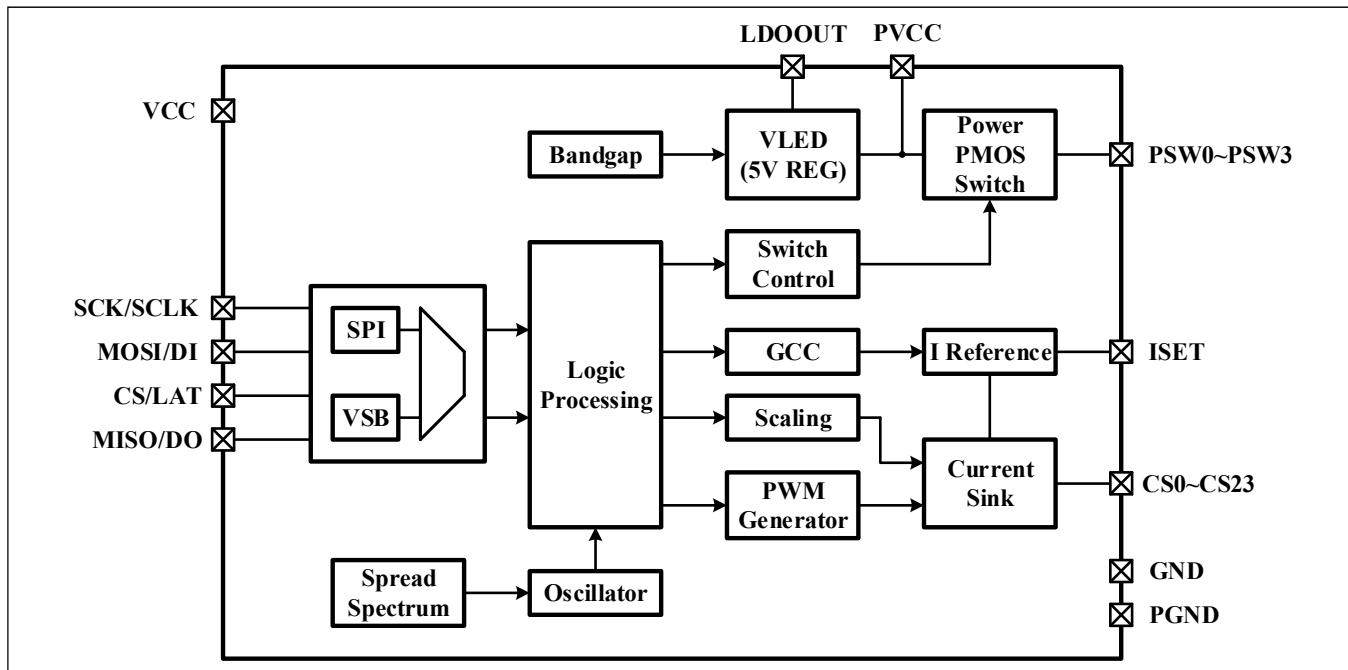

$$\Delta I_{OUT} = ABS \left( \frac{\frac{I_{OUT0}+I_{OUT1}+\dots+I_{OUT23}}{24} - I_{OUT(IDEAL)}}{I_{OUT(IDEAL)}} \right) \times 100\%$$

Where I<sub>OUT(IDEAL)</sub>= 60mA when R<sub>ISET</sub>= 1kΩ.

**Note 6:** Guaranteed by design.

# IS31FL3749

## FUNCTIONAL BLOCK DIAGRAM

# IS31FL3749

## DETAILED DESCRIPTION

IS31FL3749 support SPI interface and VSB (Video serial bus) interface.

### SPI INTERFACE

IS31FL3749 uses a SPI protocol to control the chip's function with four wires: CS, SCK, MOSI and MISO. SPI transfer starts from CS pin from high to low controlled by Master (Microcontroller), and IS31FL3749 latches data when CS is asserted (low to high).

The maximum SCK frequency supported in IS31FL3749 is 33MHz.

### WRITING OPERATION

SPI write data format is 8-bit (byte) command followed by the register data. The command byte determines the length and function of the register data.

When writing Update/Reset/Fault Flag Clear Register to IS31FL3749, only the command is sent (without data). The IS31FL3749 SPI write register timing as shown in figure 4~7.

### READING OPERATION

FC0, FC1, fault status, open/short detect result registers can be read by SPI.

To read the registers, the first command byte selects the corresponding register, followed by a CS pulse to latch after read command byte is written to IS31FL3749. Read register timing as shown in figure 8, read the MISO data after sending the read command byte.

All register writes and read command as shown in Table 1.

**Figure 10** SPI Reading from IS31FL3749 (Two Chips Cascade)

# IS31FL3749

## VSB INTERFACE

IS31FL3749 uses a VSB protocol to control the chip's function with four wires: DI, SCLK, LAT and DO. VSB transfer starts from DI and SCLK controlled by Master (Microcontroller), and IS31FL3749 latches data when LAT is asserted (low to high).

The maximum SCLK frequency supported in IS31FL3749 is 33MHz.

## WRITING OPERATION

VSB write data format is 8-bit (byte) command followed by the register data. The command byte determines the length and function of the register data. When writing Update/Reset/Fault Flag Clear Register to IS31FL3279, only the command is sent (without

data). The IS31FL3749 VSB write register timing as shown in figure 12~15.

## READING OPERATION

FC0, FC1, fault status, open/short detect result registers can be read by VSB.

To read the registers, the first command byte selects the corresponding register, followed by a LAT pulse to latch after read command byte is written to IS31FL3749. Read register timing as shown in figure 16/17, read the DI or DO data after sending the read command byte.

All register writes and read command as shown in Table 1.

Reset	Reset Register	Reset all registers	22	W	-

## PWM Register

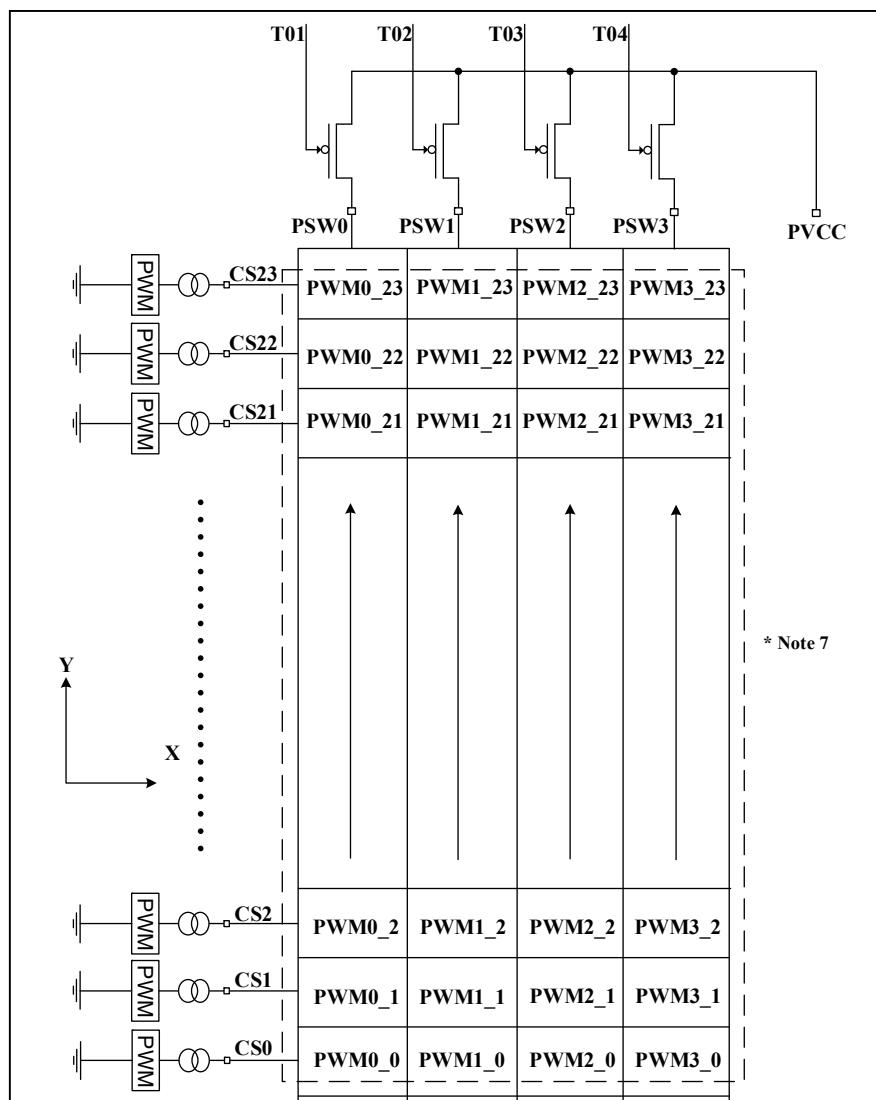

Figure 21 PWM Register

**Note 7:** PWM<sub>x\_0</sub>~PWM<sub>x\_23</sub> is PWM Register for PSW<sub>x</sub>. Each PWM<sub>x\_y</sub> contains 16-bit data, control the PWM duty of each dot. Each dot has two bytes PWM data to modulate the PWM duty in 256/4096/65536 steps.

# IS31FL3749

**Table 3 PWMx\_0~PWMx\_23 PWM Register**

Unit	PWMx_23		...	PWMx_0	
Bit	383:376	375:368	...	15:8	7:0
Name	PWM_H	PWM_L	...	PWM_H	PWM_L
Default	00000000	00000000	...	00000000	00000000

Each dot has two PWM bytes to modulate the PWM duty in 256/4096/65536 steps. If using 8 bits PWM resolution, only PWM\_H 8 bits need to be set. If using 8+4-bit PWM resolution, only PWM\_H 8 bits and high 4 bits of PWM\_L need to be set.

The value of the PWM Registers decides the average current of each LED noted  $I_{LED}$ .

$I_{LED}$  computed by Formula (1):

$$I_{LED} = \frac{PWM}{N} \times I_{OUT(PEAK)} \times Duty \quad (1)$$

$$N=256: \quad PWM = \sum_{n=0}^7 D[n] \cdot 2^n \quad (8\text{-bit mode})$$

$$N=4096: \quad PWM = \sum_{n=0}^{11} D[n] \cdot 2^n \quad (8+4\text{-bit mode})$$

$$N=65536: \quad PWM = \sum_{n=0}^{15} D[n] \cdot 2^n \quad (8+8\text{bit}/16\text{-bit mode})$$

Where Duty is the duty cycle of PSWx, see SCANING TIMING section for more information. When PSWS= “000” and in 8+4-bit dithering/8+8-bit dithering/8bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{16.5\mu s}{(17.3\mu s + 0.3\mu s)} \times \frac{1}{4} = \frac{1}{4.27} \quad (2, 8\text{-bit mode})$$

When PSWS= “000” and in 16-bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{4.095ns}{(4.096ns + 0.0003ns)} \times \frac{1}{4} = \frac{1}{4.001} \quad (2, 16\text{-bit mode})$$

$I_{OUT}$  is the output current of CSy ( $y=0\sim23$ ),

$$I_{OUT(PEAK)} = \frac{60}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

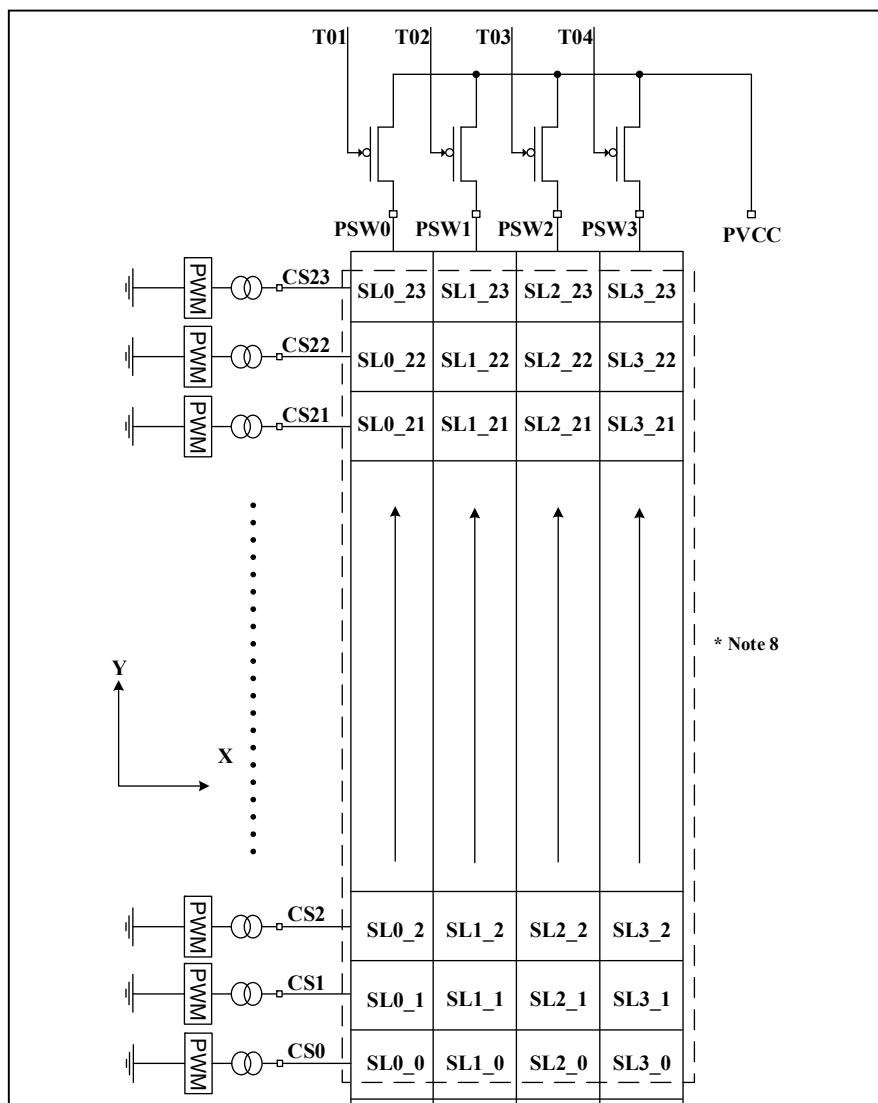

GCC is the Global Current Control register (D32:D9 of FC0) value, SL is the Scaling register value as Table 5 and  $R_{ISET}$  is the external resistor of ISET pin. D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if in 8-bit PWM mode, PWM register D7:D0=1011 0101 (0xB5, 181), GCC=1111 1111,  $R_{ISET}=1k\Omega$ , SL=1111 1111:

$$I_{LED} = \frac{60}{1k\Omega} \times \frac{255}{256} \times \frac{255}{256} \times \frac{1}{4.27} \times \frac{181}{256}$$

# IS31FL3749

## SL Register

**Figure 22** SL Register

**Note 8:** SL<sub>x\_0</sub>~SL<sub>x\_23</sub> is SL Register for PSW<sub>x</sub>. Each SL<sub>x\_y</sub> contains 8-bit data, control the DC output current of each dot. Each dot has a scaling byte to modulate the scaling in 256 steps.

# IS31FL3749

**Table 4 SLx\_1~SLx\_24 SL register**

Unit	SLx_24	...	SLx_1
Bit	191:184	...	7:0
Name	SL	...	SL
Default	11111111	...	11111111

Scaling register control the DC output current of each dot. Each dot has a scaling byte to modulate the scaling in 256 steps.

The value of the Scaling Register decides the peak current of each LED noted  $I_{OUT(PEAK)}$ .

$I_{OUT(PEAK)}$  computed by Formula (3):

$$I_{OUT(PEAK)} = \frac{60}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$SL = \sum_{n=0}^7 D[n] \cdot 2^n$$

$I_{OUT}$  is the output current of CSy ( $y=0\sim23$ ), GCC is the Global Current Control Register (D32:D9 of FC0) value and  $R_{ISET}$  is the external resistor of ISET pin.  $D[n]$  stands for the individual bit value, 1 or 0, in location n.

For example: if in 8-bit PWM mode,  $R_{ISET}=1k\Omega$ ,  $GCC=1111 1111$ ,  $SL=0111 1111$ :

$$SL = \sum_{n=0}^7 D[n] \cdot 2^n = 127$$

$$I_{OUT} = \frac{60}{1k\Omega} \times \frac{255}{256} \times \frac{127}{256} = 29.6mA$$

$$I_{LED} = 29.6mA \times \frac{1}{4.27} \times \frac{PWM}{256}$$

**Table 6 FC0 Unit (8:0) Configuration Register**

Bit	8:6	5:3	2:1	0
Name	PSWS	OSC	PWMM	SSD
Default	000	000	01	0

The Configuration Register sets operating mode of IS31FL3749.

PSWS control the duty cycle of the PSW, default mode is 1/4.

The OSC bit selects the oscillator clock frequency, default is 16MHz.

The PWMM bit selects PWM resolution mode, default PWM resolution mode is 8+8-bit dithering.

When SSD is "1", IS31FL3749 enter software shutdown mode and to normal operate the SSD bit should set to "0".

**PSWS** PSW Scan Setting

000	PSW0~PSW3 scan
001	PSW0~PSW2 scan, PSW3 no active
010	PSW0~PSW1 scan, PSW2,3 no active
011	PSW0~PSW1 scan, PSW0=PSW2, PSW1=PSW3;
100	PSW0 scan only, PSW1,2,3 no active
101	PSW1 scan only, PSW0,2,3 no active
110	PSW2 scan only, PSW0,1,3 no active
111	PSW3 scan only, PSW0,1,2 no active

**OSC** Oscillator Clock Frequency Select

000	16MHz(default)
001	32MHz
010	8MHz
011	0.25MHz (only for 8-bit PWM mode)
100	12MHz
101	24MHz
110	6MHz
111	0.19MHz (only for 8-bit PWM mode)

**PWMM** PWM Mode Select

00	16-bit (OSC should be 24MHz or 32MHz)
01	8+8-bit dithering (OSC should be 24MHz or 32MHz)
10	8+4-bit dithering
11	8-bit

**SSD** Software Shutdown Control

0	Normal operation
1	Software shutdown

**Table 7 PWM Frequency:**

PWM Frequency	32MHz	16MHz	8MHz	0.25MHz
16-bit	488Hz	-	-	-
8+8-bit	488Hz~125kHz	-	-	-
8+4-bit	7.8kHz~125kHz	3.9kHz~62.5kHz	1.95kHz~31.2kHz	-
8-bit	125kHz	62.5kHz	31.2kHz	0.97kHz

PWM Frequency	24MHz	12MHz	6MHz	0.19MHz
16-bit	366Hz	-	-	-
8+8-bit	366Hz~93.7kHz	-	-	-

Bit	23:16
Name	GCCB
Default	11111111

Set global current for B channels (CS2, CS5...CS23)

The Global Current Control Register modulates all CSy (y=0~23) DC current which is noted as  $I_{OUT}$  in 256 steps.

$I_{OUT}$  is computed by the Formula (3):

$$I_{OUT(PEAK)} = \frac{60}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$GCC = \sum_{n=0}^7 D[n] \cdot 2^n$$

# IS31FL3749

Where D[n] stands for the individual bit value, 1 or 0, in location n.

**Table 11 FC0 Unit (38:33) Phase Delay & Edge Select & Random Enable Register**

Bit	38	37:36	35	34	33
Name	RDMEN	TDO	DOE	DIE	PNR
Default	0	11	1	0	1

RDMEN control SW Random of scan enable bit. When RDMEN set to “1”, PSW will pull up randomly and that is SW scan frequency will by random.

Set PNR to change the clock phase of odd channels and even channels. It is helpful for reduction power noise.

**PDMEN** PSW Random Scan

0	disable
1	enable

**TDO** DO Output Delay Time

**Table 12 FC1 Unit (6:0) SYNC& Spread Spectrum Register**

Bit	6	5:4	3:2	1:0
Name	SSP	-	SCLT	MS
Default	0	00	00	00

Spread Spectrum Register set the spread spectrum (SSP) and synchronization function of IS31FL3749. The spread spectrum range is  $\pm 5\%$ . When SSP enable, the spread spectrum function will be enabled and the SCLT bits will adjust the cycle time of spread spectrum function. The oscillator clock frequency recommends that the 8MHz be at least when the spread spectrum function is enabled.

When two or more IS31FL3749 are cascaded, the MS bit is set to “11” for the master IS31FL3749. The master IS31FL3749's SYNC/GCLK pin will generate a clock signal to all the slave devices. To be

configured as a clock slave device and accept an external clock input the slave device's MS bit must be set to “10”.

**SSP** Spread Spectrum Function Enable

0	disable
1	enable

**SCLT** Spread Spectrum Cycle Time

00	1980 $\mu$ s
01	1200 $\mu$ s

**MS** Enable of SYNC Function

0x	Disable, 30k $\Omega$ pull-down; (default)

**Table 17 FC1 Unit (47) Read Direction Select Register**

Bit	47
Name	SIOM
Default	1

Set SIOM to select read data mode.

IS31FL3749 support single direction and Bi-direction to reading data when uses VSB (Video serial bus) interface.

When select read data single direction, read register data from DO pin after sending the read command.

When select Read data Bi-direction, read register data from DI pin after sending the read command.

**SIOM** Read Direction Select

0	Read data Bi-direction
1	Read data single direction

**Table 18 OS23~OS0 Unit (23:0) Open/Short Detect Result Register (Read Only)**

Bit	23:0
Name	OS23:OS0
Default	-

When OSDE (D38:D37 of FC1) is set to "11", open detection will enable, and the LED open status will be detected in real time, the open information will be stored at this register.

When OSDE (D38:D37 of FC1) is set to "10", short detection will enable, and the LED short status will be detected in real time, the short information will be stored at this register.

Before set OSDE, the GCC should set to 0x0F, and need send Fault Flag Clear each time before reading open detect result or short detect result.

Please check OPEN/SHORT DETECT FUNCTION section for more information.

Bit	7:0
Name	Fault Flag Clear
Default	-

When SDB= "H" and SSD= "1", send Fault Flag Clear Command(0x02) to IS31FL3749 will clear Fault Flag Register status and Open/Short detect result Register status.

# IS31FL3749

**Table 21 PWM Update Unit (7:0) Register (Write Only)**

Bit	7:0
Name	Update
Default	-

When SDB= "H" and SSD= "1", send Update Command(0x08) to IS31FL3749 will update the PWM register (PWMx\_0~PWMx\_23) values.

**Table 22 Reset Unit (7:0) Reset Register (Write Only)**

Bit	7:0
Name	Reset
Default	-

When working in normal operation mode, sending Reset Command (0x0E) to IS31FL3749 will reset all registers to default values.

# IS31FL3749

## APPLICATION INFORMATION

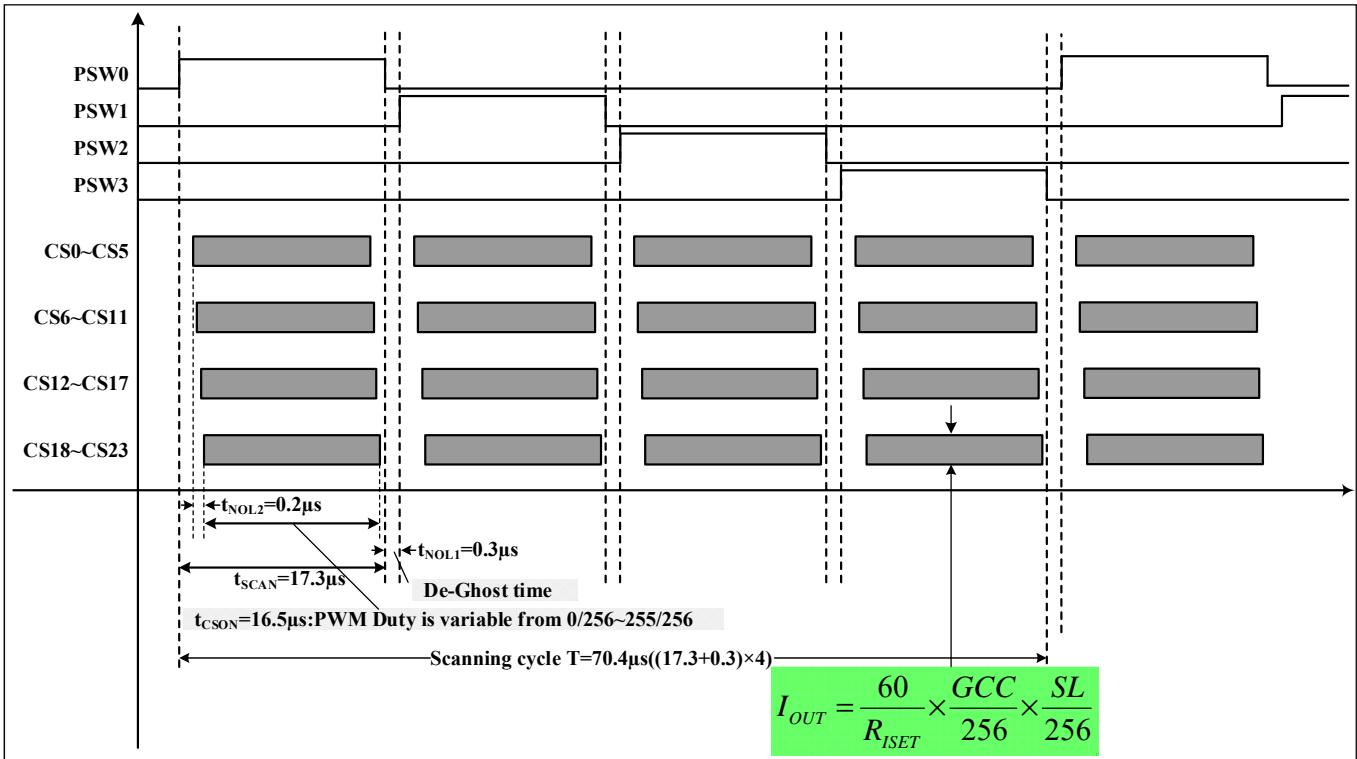

Figure 23 Scanning Timing (8-bit PWM Mode, OSC=16MHz)

## SCANING TIMING

As shown in Figure 23, the PSW0~PSW3 is turned on by serial, LED is driven 4 by 4 within the PSWx ( $x=0\sim 3$ ) on time (PSWx,  $x=0\sim 3$  is source and it is high when LED on) and in 8+4-bit dithering/8+8-bit dithering/8bits PWM mode (OSC=16MHz), including the non-overlap blanking time during scan, the duty cycle of PSWx (active high,  $x=0\sim 3$ , PSWS= "000") is:

$$Duty = \frac{16.5\mu s}{(17.3\mu s + 0.3\mu s)} \times \frac{1}{4} = \frac{1}{4.27} \quad (2)$$

Where  $16.4\mu s$  is  $t_{SCAN}$ , the period of PSWx scanning,  $15.9\mu s$  is  $t_{CSOn}$ , the CS-ON time during scan,  $0.3\mu s$  is  $t_{NOL1}$ , the non-overlap time.

## PWM CONTROL

After setting the  $I_{OUT}$ ,  $GCC$  and  $SL$ , the brightness of each LEDs (LED average current ( $I_{LED}$ )) can be modulated with 256 steps by PWM Register in 8bits PWM mode (OSC=16MHz).

For PSWS= "000",  $I_{OUT}$  is computed by the Formula (2):

$$Duty = \frac{16.5\mu s}{(17.3\mu s + 0.3\mu s)} \times \frac{1}{4} = \frac{1}{4.27} \quad (2)$$

$$GCC = \sum_{n=0}^7 D[n] \cdot 2^n$$

$$SL = \sum_{n=0}^7 D[n] \cdot 2^n$$

Where  $D[n]$  stands for the individual bit value, 1 or 0, in location n.

The value of the PWM Registers decides the average current of each LED noted  $I_{LED}$ ,  $I_{LED}$  is computed as Formula (1):

$$I_{LED} = \frac{PWM}{N} \times I_{OUT(Peak)} \times Duty \quad (1)$$

$$PWM = \sum_{n=0}^7 D[n] \cdot 2^n$$

Where PWM is PWM Registers data showing in Table 4.

For example, if in 8-bit PWM mode,  $R_{ISET}= 1k\Omega$ ,  $PWM= 255$ , and  $GCC= 255$ ,  $SL= 255$ , then

$$I_{OUT(Peak)} = \frac{60}{1k\Omega} \times \frac{255}{256} \times \frac{255}{256} = 59.5mA$$

$$I_{LED} = I_{OUT(Peak)} \times \frac{1}{4.27} \times \frac{PWM}{256}$$

# IS31FL3749

## OPERATING MODE

IS31FL3749 can only operate in PWM Mode. The brightness of each LED can be modulated with 256/4096/65536 steps by PWM registers. For example, if the data in PWM Register is “0000 0100”, then the PWM is the fourth step.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## OPEN/SHORT DETECT FUNCTION

IS31FL3749 has open/short detect bit for each LED.

The open/short status register stores the open/short information of LED string.

To get the correct open/short information, several configurations are recommended to set before setting the OSDE bit (D38:D37 of FC1):

The two configurations need to set before setting the OSDE bits:

1  $0x0F \leq GCC \leq 0x40$

2 PSWx Pull Down Voltage = floating,

CSy Pull Up Voltage = floating,

3 PWM >40%

Where GCC is the Global Current Control Register and the Pull down/up Voltage Selection Register set (D16:D14 of FC1) to 0x000 is set PSWx pull-down voltage and (D23:D20/D27:D24 of FC1) set to 0x0000 is set CSy pull-up voltage to floating.

The detect action is one-off event and each time before reading out the open/short information need clear Fault Flag Register status (send Fault Flag Clear Command(0x02)).

## DE-GHOST FUNCTION

The “ghost” term is used to describe the behavior of an LED that should be OFF but instead glows dimly when another LED is turned ON. A ghosting effect typically can occur when multiplexing LEDs. In matrix architecture any parasitic capacitance found in the constant-current outputs or the PCB traces to the LEDs may provide sufficient current to dimly light an LED to create a ghosting effect.

To prevent this LED ghost effect, the IS31FL3749 has integrated Pull down voltage setting for each PSWx ( $x=0\sim 3$ ) and Pull up voltage setting for each CSy ( $y=0\sim 23$ ). Select the right PSWx Pull down voltage (D16:D14 of FC1) and CSy Pull up voltage (D27:D20 of FC1) which eliminates the ghost LED for a particular matrix layout configuration.

Typically, need to depending on how many LED is connect in series in one LED dot position, selecting

the voltage setting will be sufficient to eliminate the LED ghost phenomenon.

When IS31FL3749 works in shutdown mode, the de-ghost function should be disabled.

## SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

### Software Shutdown

By setting SSD bit of the Configuration Register (D0 of FC0) to “1”, the IS31FL3749 will operate in software shutdown mode. When the IS31FL3749 is in software shutdown, all current sinks are switched off, so that the matrix is blanked.

### Hardware Shutdown

The chip enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown.

The chip releases hardware shutdown when the SDB pin is pulled high. During hardware shutdown state Function Register can be operated.

If  $V_{CC}$  has risk drop below 1.75V but above 0.1V during SDB pulled low, please re-initialize all Function Registers before SDB pulled high.

## LAYOUT

The IS31FL3749 consumes lots of power so good PCB layout will help improve the reliability of the chip. Please consider below factors when layout the PCB.

When designing the PCB layout pattern, the first step should consider about the supply line and GND connection, especially those traces with high current, also the digital and analog blocks' supply line and GND should be separated to avoid the noise from digital block affect the analog block.

At least one  $10\mu F + 0.1\mu F$  capacitor for PVCC pin, if possible, with a  $0.47\mu F$  or  $1\mu F$  capacitor is recommended to connected to the ground at each power supply pins of the chip, and it needs to close to the chip and the ground net of the capacitor should be well connected to the GND plane.

1. The  $V_{CC}$  (PVCC, VCC) capacitors need to close to the chip and the ground side should well have connected to the GND of the chip.

2.  $R_{ISET}$  should be close to the chip and the ground side should well connect to the GND of the chip.

3. The thermal pad should connect to ground pins and the PCB should have the thermal pad too, usually this pad should have 16 or 25 via thru the PCB to other side's ground area to help radiate the heat. About the thermal pad size, please refer to the land pattern of each package.

# IS31FL3749

4. The CSy pins maximum current is 60mA ( $R_{SET}=1\text{k}\Omega$ ), and the PSWx pins maximum current is larger, the width of the trace, PSWx should have wider trace than CSy.

## THERMAL CONSIDERATION

The over temperature of the chip may result in deterioration of the properties of the chip. IS31FL3749 has thermal pad but the chip could be very hot if power is very large. So, do consider the ground area connects to the GND pins and thermal pad. Other traces should keep away and ensure the ground area below the package is integrated, and the back layer should be connected to the thermal pad thru 9 or 16 vias to be maximized the area size of ground plane.

The package thermal resistance,  $\theta_{JA}$ , determines the amount of heat that can pass from the silicon die to the surrounding ambient environment. The  $\theta_{JA}$  is a measure of the temperature rise created by power dissipation and is usually measured in degree Celsius per watt ( $^{\circ}\text{C}/\text{W}$ ).

When operating the chip at high ambient temperatures, or when driving maximum load current, care must be taken to avoid exceeding the package power dissipation limits. The maximum power dissipation can be calculated using the following Formula (6):

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}} \quad (6)$$

So,

$$P_{D(MAX)} = \frac{125^{\circ}\text{C} - 25^{\circ}\text{C}}{37.4^{\circ}\text{C}/\text{W}} \approx 2.67\text{W}$$

Figure 24, shows the power derating of the IS31FL3749 on a JEDEC boards (in accordance with JESD 51-5 and JESD 51-7) standing in still air.

## CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
<b>Preheat &amp; Soak</b> Temperature min (Tsmin) Temperature max (Tsmax) Time (Tsmin to Tsmax) (ts)	150°C 200°C 60-120 seconds
Average ramp-up rate (Tsmax to Tp)	3°C/second max.
Liquidous temperature (TL) Time at liquidous (tL)	217°C 60-150 seconds
Peak package body temperature (Tp)*	Max 260°C
Time (tp)** within 5°C of the specified classification temperature (Tc)	Max 30 seconds
Average ramp-down rate (Tp to Tsmax)	6°C/second max.
Time 25°C to peak temperature	8 minutes max.

## PACKAGE INFORMATION

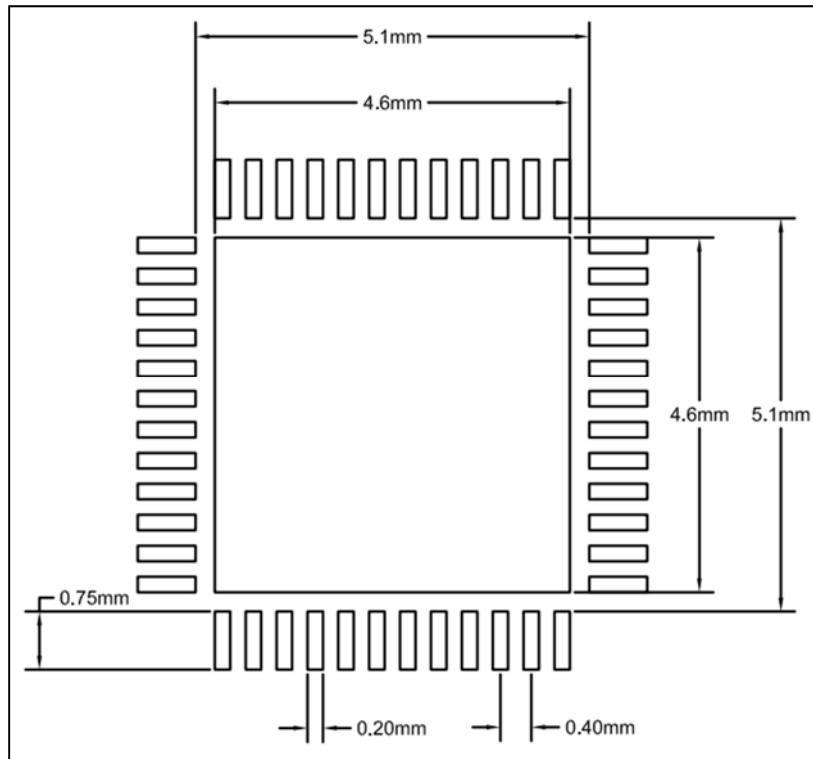

### QFN-48

# IS31FL3749

## RECOMMENDED LAND PATTERN

QFN-48

**Note:**

1. Land pattern complies to IPC-7351.
2. All dimensions in MM.
3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. User's board manufacturing specs), user must determine suitability for use.
