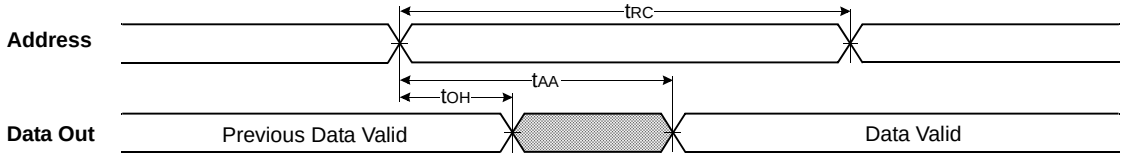
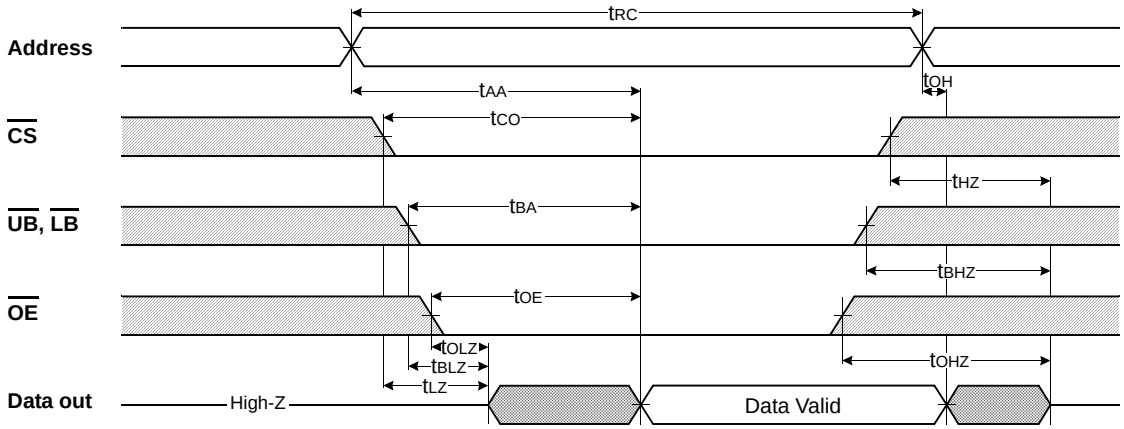
## TIMING DIAGRAMS

### TIMING WAVEFORM OF READ CYCLE(1) (Address Controlled, $\overline{CS}$=$\overline{OE}$=$V_{IL}$, $\overline{WE}$=$V_{IH}$, $\overline{UB}$ or/and $\overline{LB}$=$V_{IL}$)



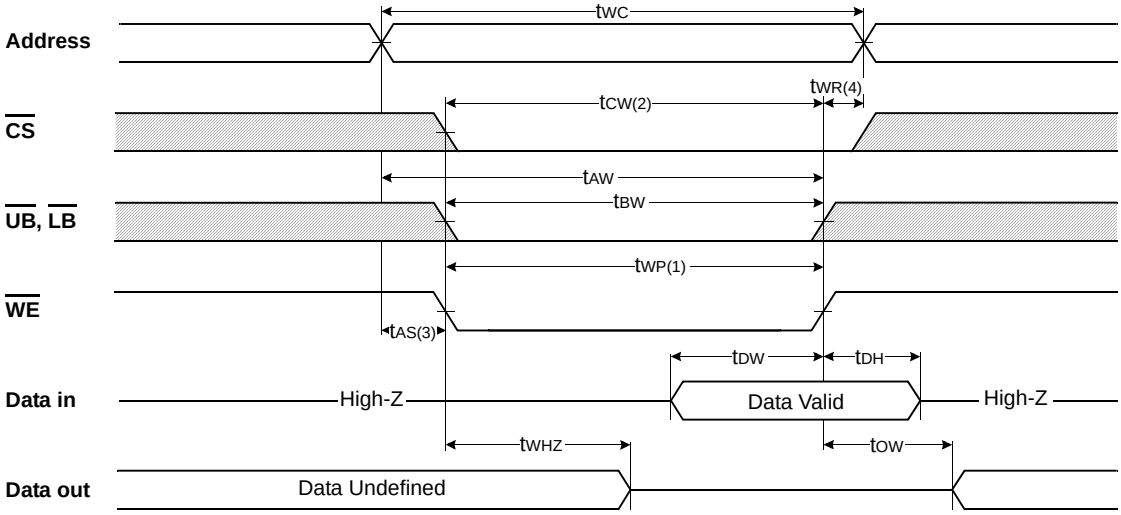
### TIMING WAVEFORM OF READ CYCLE(2) ($\overline{WE}$=$V_{IH}$)



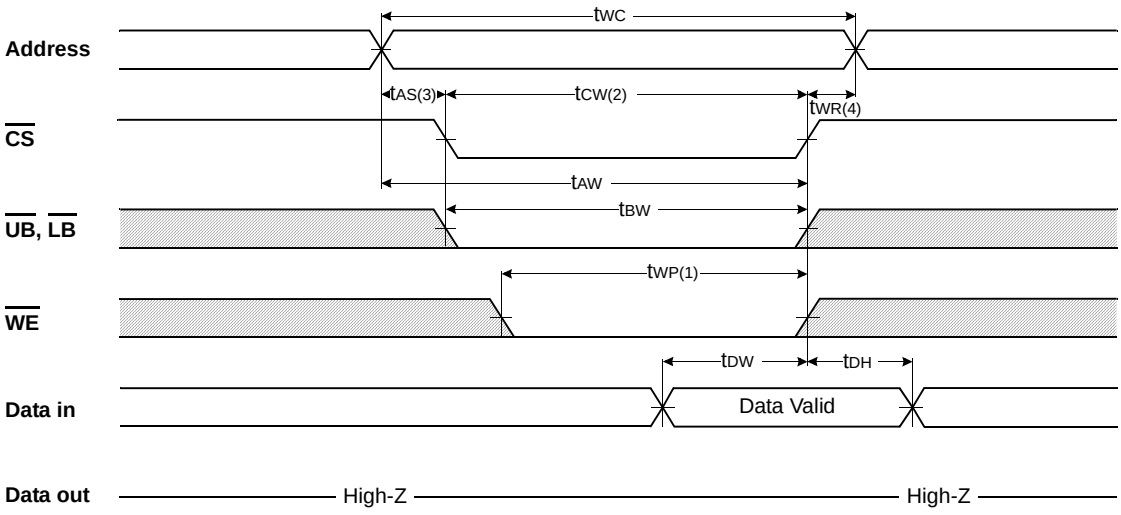
**NOTES** (READ CYCLE)

1. $t_{HZ}$ and $t_{OHZ}$ are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, $t_{HZ}$(Max.) is less than $t_{LZ}$(Min.) both for a given device and from device to device interconnection.

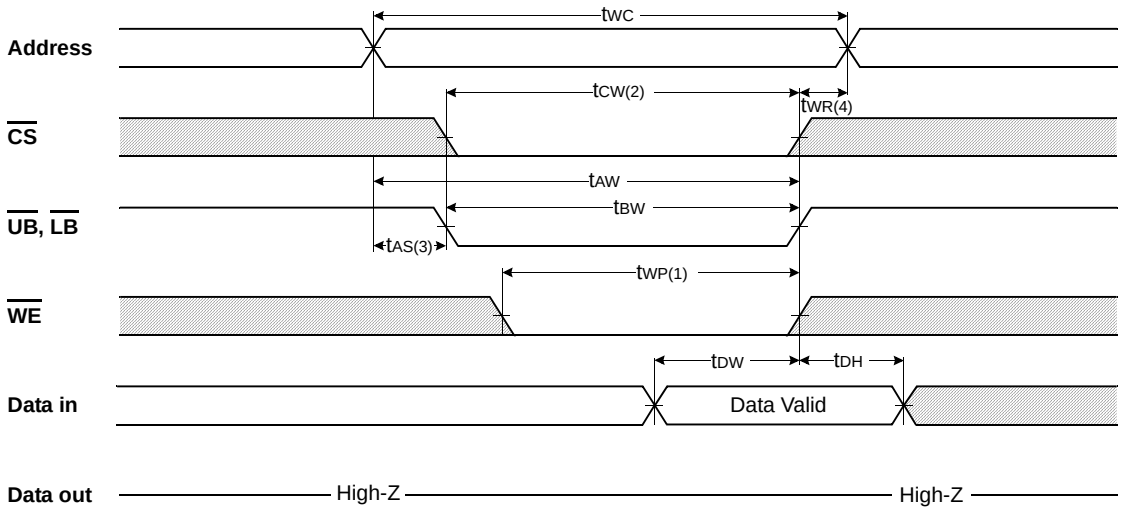
### TIMING WAVEFORM OF WRITE CYCLE(1) ($\overline{WE}$ Controlled)



### TIMING WAVEFORM OF WRITE CYCLE(2) ($\overline{CS}$ Controlled)



### TIMING WAVEFORM OF WRITE CYCLE(3) ($\overline{UB}$, $\overline{LB}$ Controlled)



**NOTES** (WRITE CYCLE)

1. A write occurs during the overlap($t_{WP}$) of low $\overline{CS}$ and low $\overline{WE}$. A write begins when $\overline{CS}$ goes low and $\overline{WE}$ goes low with asserting $\overline{UB}$ or $\overline{LB}$ for single byte operation or simultaneously asserting $\overline{UB}$ and $\overline{LB}$ for double byte operation. A write ends at the earliest transition when $\overline{CS}$ goes high and $\overline{WE}$ goes high. The $t_{WP}$ is measured from the beginning of write to the end of write.
2. $t_{CW}$ is measured from the $\overline{CS}$ going low to the end of write.
3. $t_{AS}$ is measured from the address valid to the beginning of write.
4. $t_{WR}$ is measured from the end of write to the address change. $t_{WR}$ applied in case a write ends as $\overline{CS}$ or $\overline{WE}$ going high.
