Introduction

This databook contains information about KG80/KGM80, 0.5 μm 5V/3.3V DLM/TLM gate array cell library developed by SEC (Samsung Electronics Corporation).

The “library” basically contains various kinds of internal and I/O cells and soft-macros which are used for developing ASIC (Application Specific Integrated Circuit). It also includes a design kit helping designers to work in a workstation platform, and all sorts of design environments needed for an automatic chip design.

There are six chapters in this databook:

Chapter 1	Introduction to KG80/KGM80
Chapter 2	Electrical Characteristics
Chapter 3	Internal Macrocells
Chapter 4	Input/Output Cells
Chapter 5	Memory Compilers
Chapter 6	JTAG Boundary Scans.

In this databook each cell is followed by its AC electrical characteristics, and these characteristic values are almost equal when the corresponding cell is operated in a real chip.

The purpose of this databook is to prevent any misuse or misapplication of KG80/KGM80 cell library by providing precise information about the cell list, electrical data, directions for use, and matters demanding special attention.

Table of Contents

1 Introduction to KG80/KGM80

Library Description 1-1
Features 1-1
CAE Support 1-2
Product Family 1-2
- Internal Macrocells 1-2
- Macrofunctions 1-2

LIBRARY DESCRIPTION

SEC ASIC offers KG80 5V gate array family and KGM80 3.3V gate array family. KG80 and KGM80 are 0.5μm CMOS processes supporting double-layer or triple-layer metal interconnection options.

The gate array is a kind of design methods. In this design method, all processes before a metal wiring have been completed in a masterslice, and the remaining processes from a metal wiring will be added on the prepared masterslice to form a user-specific circuit. The gate array is used world-widely because of its short period of products development.

With the regard to the mixed using of 5V and 3.3V, 5V-to-3.3V and 3.3V-to-5V convertible cells having level shifters inside themselves are provided in addition to the existing normal input/output cells. Moreover, the other interface cells (CMOS, TTL and Schmitt trigger) are fully equipped for your wide selection.

In order to ensure the product reliability, we efficiently prevent any possible noise, ESD and latch-up. Various kinds of memory compiler, macrofunction and megafunction cells may satisfy the complicated design requirements and offer convenience to users.

There are 14 kinds of masterslices provided (they are preliminary), therefore, you can choose the most appropriate masterslice according to the gate count and pin number of the product.

Every work operation in a design flow has been systematized and automated, and each stage is designed to go through enough reviews and verifications. It makes the design work easier and faster, and prevents any errors or mistakes possible through a design flow.

FEATURES

- ❑ KG80: 5volt gate array library
  KGM80: 3.3volt gate array library
- ❑ Mixed 5V/3.3V I/O interface
- ❑ 0.5μm 5V HCMOS channelless technology
  – Double and Triple layer metal options
- ❑ High basic cell usages
  – 42,400 to 1,250,000 total number of gates
  – Maximum usage: 70% for triple layer metal
  – Maximum usage: 40% for double layer metal
- ❑ High speed
  – 0.2 ns (for KG80) and 0.3ns (for KGM80) delay of 2-input NAND with fanout = 2
- ❑ Fully configurable RAM,ROM and DPRAM
  – Up to 9K-bit RAM available
  – Up to 36K-bit ROM available
  – Up to 9K-bit DPRAM available
- ❑ Configurable FIFO and Multiplier available
- ❑ Operating Temperature (T_A)
  – Commercial range: 0˚C to +70˚C
  – Industrial range: –40˚C to +85˚C
- ❑ ESD and latch-up protection
  – ESD: 2000V (Min.)
  – Latch-up: 300mA (Min.)
- ❑ Selectable output current drive capability
  – 1/2/4/8/12/16/20/24mA available for 5V
  – 1/2/4/6/8/10/12/16mA available for 3.3V
- ❑ TTL, CMOS, LVTTL, LVCMOS and Schmitt trigger I/Os
- ❑ X-tal oscillators
- ❑ PCI, PCMCIA buffers
- ❑ GTL, NTL, CardBus, SCSI, PECL under-developed
- ❑ Various package options
- ❑ Fully integrated CAD software support
  – Verilog, Viewlogic, Mentor and Synopsys

CAE SUPPORT

KG80/KGM80 supports popular design platforms and environments such as Verilog, Viewlogic, Mentor and Synopsys for front-end logic design capture and simulation, and Gate Ensemble and Gards for back-end placement and routing.

For a high simulation accuracy, KG80/KGM80 uses a proprietary delay calculator. Cell delay calculations are based on a matrix of delay parameters for each macrocell, and signal interconnection delay is based on the RC tree analysis.

PRODUCT FAMILY

KG80/KGM80 library include the following design elements:

(a) Internal Macrocells
(b) Input/Output Cells
(c) Macrofunctions
(d) Megafunctions
(e) Memory Compilers
(f) JTAG Boundary Scans.

< Internal Macrocells >

Macrocells are the lowest level of logic functions such as NAND, NOR and flip-flop used for logic designs. There are about 300 different types of internal macrocells. They usually come in two levels of drive strength (1X and 2X).

These macrocells have many levels of representations—logic symbol, logic model, timing model, transistor schematic, HSPICE netlist, physical layout, and placement and routing model.

< Macrofunctions >

Macrofunctions are netlists of logic function which have the complexity of a standard MSI circuit. Macrofunctions are logic building blocks. There are 44 kinds of 74XX (TTL) compatible functions in this library.

< Megafunctions >

Megafunctions are also netlists of logic function, but with a high logic complexity of a standard LSI circuit. Multipliers, barrel shifters, 82XX Intel functions, etc. are supported in this library.

< Memory Compilers>

Memory compilers of KG80/KGM80 consist of asynchronous ROM, single-port RAM, dual-port RAMs, RAM-based FIFO and Multiplier generators. There are two types of dual-port RAMs; one read one write DPRAM and one read/write one read DPRAM.

< Input/Output Cells >

There are about one thousand different I/O buffers. Each I/O cell is implemented solely on the basic I/O cell architecture which forms the periphery of the masterslice.

A test logic is provided to enable the efficient parametric (threshold voltage) testing on input buffers including CMOS and TTL level converters, Schmitt trigger input buffers, clock drivers and oscillator buffers. Pull-up and pull-down resistors are optional features.

Three basic types of output buffers (non-inverting, tri-state and open drain) are available in a range of driving capabilities from 1mA to 24mA for 5V drive and 1mA to 16mA for 3.3V drive.Two levels of slew rate controls are provided for each buffer type (except 1mA and 2mA buffers) to reduce output power/ground bus noise and signal ringing, especially in simultaneous switching outputs.

Bi-directional buffers are combinations of input buffers and output buffers (tri-state or open drain) in a single unit. The I/O structure has been fully characterized for ESD protection and latch-up resistance.

For user's convenience, KG80/KGM80 library provides with three options of pull-down and pull-up resistances respectively. They are 50KΩ, 100KΩ, and 200KΩ (The default value is 100KΩ).

I/O Cell Drive Options

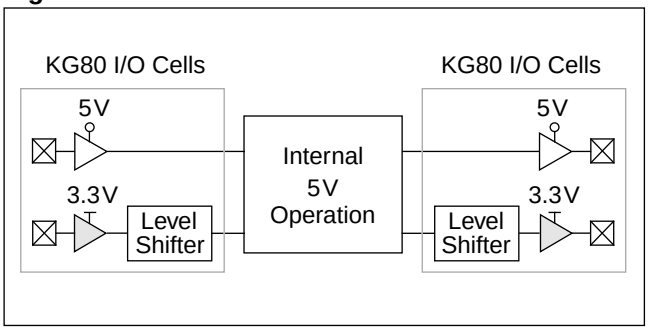
To provide designers with the greater flexibility, each I/O buffer can be selected among various current levels (e.g., 1mA, 2mA, ..., 24mA). The choice of current-level for I/O buffers affects their propagation delay and current noise.

The slew rate control helps decrease the system noise and output signal overshoot/undershoot caused by the switching of output buffers. The output edge rate can be slowed down by selecting the high slew rate control cells. KG80/KGM80 provides three different sets of output slew rate controls. Only one I/O slot is required for any slew rate control options.

5V/3.3V Mixed I/O Cells

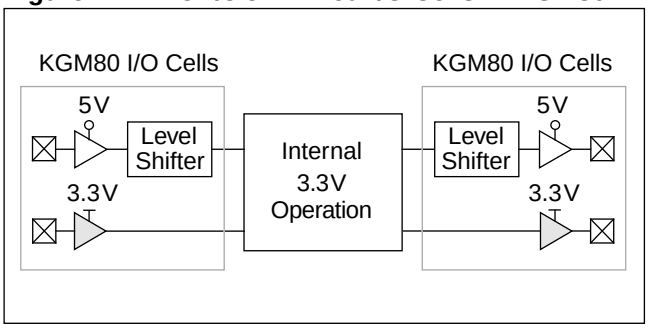
When designers intend to make transitions from 5V supplies to low voltage system, KG80 offers a solution of interfacing problems encountered in mixed 5V/3V environment. This solution provides great flexibility to different devices communicating each other. PCI and PCMCIA buffers are also available in this solution. You can see this in the following figure.

Figure 1-1. 5V/3.3V Mixed I/O Cells in KG80



In KGM80, level shifters are available to provide internal 3V core with great flexibility when it interfaces with a 5V device. Refer to the figure below.

Figure 1-2. 5V/3.3V Mixed I/O Cells in KGM80



PCI Buffers

In addition to input, output, bi-directional, slew rate controlled and Schmitt trigger I/O buffers, SEC ASIC now offers PCI (Peripheral Component Interconnect) I/O buffers. PCI is expected to be better suited to the more complex and feature-rich design than the existing local bus standards. 5V, 3.3V and Universal PCI buffers are included in the library.

CardBus Buffers

CardBus I/O buffers have 3.3V 32-bit bus width and 33MHz of transmission speed. They are for external CardBus type of extension card of notebook PC.

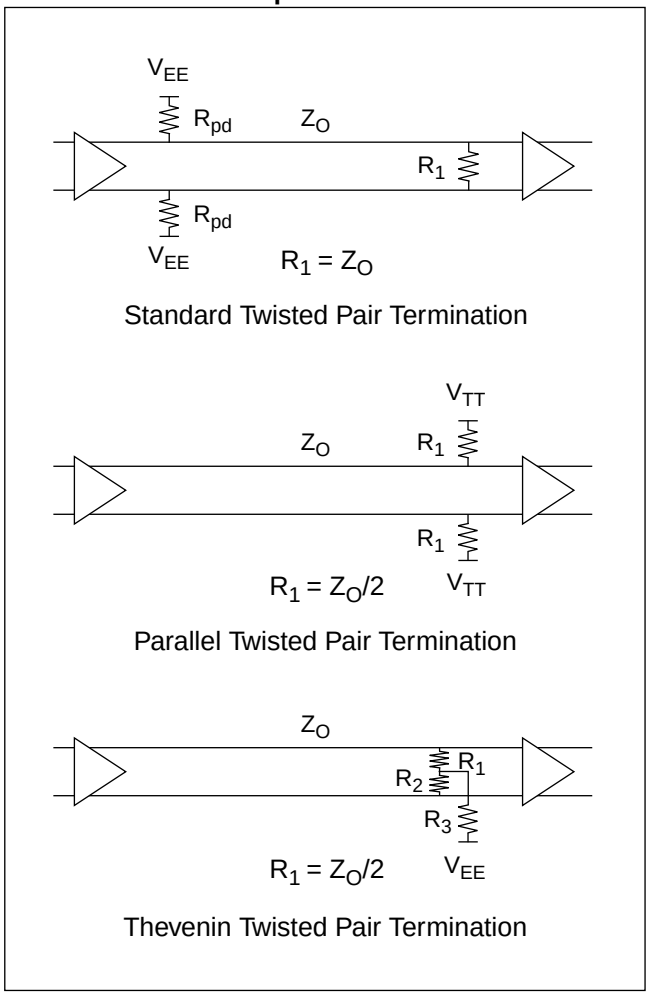
PECL

SEC ASIC's PECL (Positive Emitter Coupled Logic) buffer having 155MHz operating frequency is suited to ATM interface. It supports two voltage source modes; 5V and 3.3V.

The voltage swing level is about 0.8V, being similar to that of ECL, and the external terminator is needed. Its main features are the same as ECL; low noise, high speed and single ended/differential function.

In case of differential transmission, the external terminator is shown in the following figure.

Figure 1-3. Twisted Pair Termination Techniques

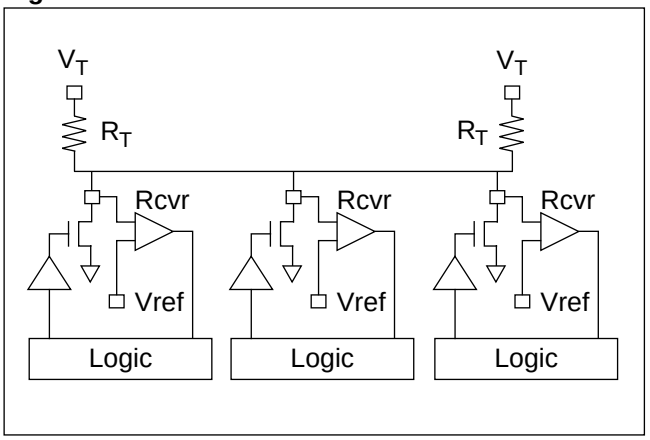


GTL (Gunning Transceiver Logic)

GTL and GTL+ interface I/Os are useful for implementing highly reliable system, satisfying fast and low-powered signal transfers and reducing noise in a switching circuitry.

In all 0.5μm cell libraries in SEC ASIC, GTL interface is fully supported.

Figure 1-4. GTL Interface



LVTTL/LVCMOS

Low Voltage TTL and Low Voltage CMOS I/O buffers have various kinds of applications as normal TTL and CMOS I/O sets. Their key features are low voltage swing and low noise.

Input voltage level is 5V compatible. Output high voltage is 2.4V ~ 3.5V in LVTTL and VDD–0.2V in LVCMOS.

SCSI

SCSI is widely used to extend peripherals, requires external terminator.

SEC ASIC supports SCSI-3 fast-20 parallel interface and SCSI-3 parallel interface only in KG80. Both of them have fail-safe function. SCSI buffer is two times as big as normal buffers.

PCMCIA

PCMCIA (Personnel Computer Memory Card Industry Association) buffers guarantees an accurate logic level even when the internal or external voltage source level of a chip changes between 5V and 3.3V.

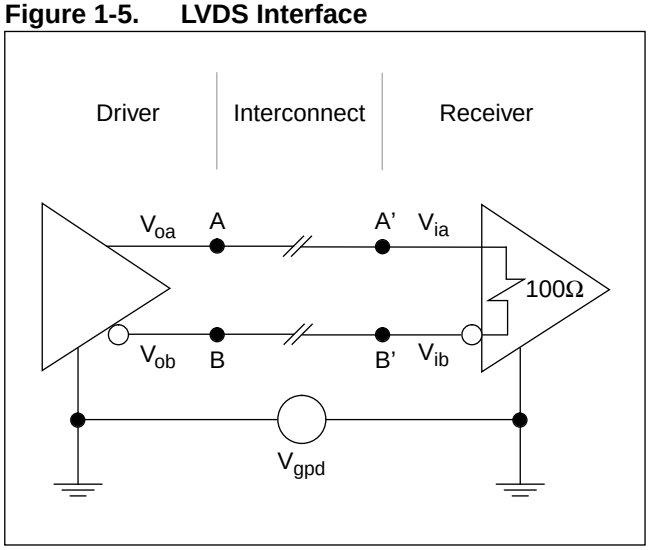
This buffers are designed for 16-bit external extension card of notebook PC.

LVDS

LVDS (Low Voltage Differential Signals) buffer for SCI (Scalable Coherent Interface) system, shown in the following figure, enables high speed I/O interface with SEC ASIC's high frequency PLL.

This structure is designed for high speed point-to-point unidirectional interface. Its main characteristics are much the same as ECL's differential mode; low noise generation, high noise immunity and low level signalling.

Figure 1-5. LVDS Interface



V_{DD}/V_{SS} RULES AND GUIDELINES

There are three types of V_{DD} and V_{SS} in KG80/KGM80, each with its related bus and pad cells. To support the use of mixed voltage, two different V_{DD} types are needed for 5V and 3.3V respectively.

(1) Core logic
  – VSSI, VDD5I (for 5V)
(2) Input buffers (usable when requested)
  – VSSP, VDD5P (for 5V), VDD3P (for 3.3V)
(3) Output buffers
  – VSSO, VDD5O (for 5V), VDD3O (for 3.3V)

The number of V_{DD} and V_{SS} pads required for a specific design depends on the following factors:

- Number of input and output buffers
- Number of simultaneous switching inputs
- Number of simultaneous switching outputs
- Number of used gates and simultaneous switching gates
- Operating frequency of the design.

Core Logic V_{SS} Bus and VSSI Pad Allocation Guidelines

The purpose of these guidelines is to ensure that V_{DD}/V_{SS} bounce caused by a simultaneous gate switching is kept to minimum. The voltage bounce on the power bus can have a negative impact on a gate-switching speed and even on the functionality of macrocells like flip-flops and latches in an extreme case.

Because of variations in package inductance, the number of V_{DD}/V_{SS} pads required for a specific design is the function of the operating frequency of a chip, i.e., designs operating at high frequency should use more V_{DD}/V_{SS} pads.

- V_{DD} bus width and pad requirements are half of V_{SS}.
- V_{DD}/V_{SS} buses and pads should be distributed evenly in the core and on all sides of the chip.
- Whenever possible, at least one VSSI pad should be used on each side of the chip.
- The total number of core logic V_{DD} pads required is half of VSSI.

The number of VSSI pads required for a design can be calculated from the following expression:

G x S x F x 2.00e−5

,where
G = Total number of used gates,
S = % of simultaneous switching gates,
F = Switching frequency in MHz.

Input Buffer V_{DD}/V_{SS} Pad Allocation Guidelines

These guidelines ensure that an adequate input threshold voltage margin is maintained during a switching.

- One VSSP is required to support 32 input buffers, and one input buffer V_{DD} can support up to 64 inputs.
- For simultaneous switching inputs, one VSSP pad is required for every 20 inputs, and one input buffer V_{DD} pad for every 40 inputs.
- Input buffer V_{SS}/V_{DD} pads should be placed in such a way that they equally divide the input buffers on either side.

Table 1-1. Minimum Input Buffer VSS/VDD for KG80/KGM80 Device Types gives the absolute minimum requirement for each device type.

Table 1-1. Minimum Input Buffer V_{SS}/V_{DD} for KG80/KGM80 Device Types

Devices	Input Buffer V_{SS}	Input Buffer V_{DD}
KG8563D	2	1
KG8144D	3	2
KG8244D	4	2
KG8444D	4	2

Output Buffer V_{DD}/V_{SS} Pad Allocation Guidelines

The number of VSSO pads required for a device can be calculated from the following expressions.

In 5V

$$\Sigma (I_{OL\ Simultaneous\ switching\ outputs}) / 40 + \Sigma (I_{OL\ Normal\ outputs}) / 64$$

In 3.3V

$$\Sigma (I_{OL\ Simultaneous\ switching\ outputs}) / 50 + \Sigma (I_{OL\ Normal\ outputs}) / 80$$

- The total number of output buffer V_{DD} pads required is half of VSSO.
- Output buffer V_{SS}/V_{DD} pads should be placed in such a way that output buffers are equally divided on either side.

POWER DISSIPATION

Estimation of Power Dissipation in CMOS Circuit

CMOS circuits have been traditionally considered to consume low power since they draw very small amount of current in a steady state. However, the recent revolution in a CMOS technology that allows very high gate density has changed the way the power dissipation should be understood. The power dissipation in a CMOS circuit is affected by various factors such as the number of gates, a switching frequency, the loading on the output of a gate, and so on.

Power dissipation is important when designers decide the amount of necessary power supply current for the device to operate in safety. Propagation delays and a reliability of the device also depend on the power dissipation which determines the temperature at which the die operates. To obtain a high speed and a reliability, designers must estimate the power dissipation of the device accurately and determine the appropriate environments including packages and system cooling methods.

This section describes the concept of two types of power dissipation (static and dynamic) in a CMOS circuit, the method of calculating them in the SEC KG80/KGM80 library, and finally their relationship with a temperature.

Static (DC) Power Dissipation

There are two types of static or DC current contributing to the total static power dissipation in CMOS circuits.

One is the leakage current of the gates resulted by a reverse bias between a well and a substrate region. There is no DC current path from power to ground in a CMOS because one of the transistor pair is always off, therefore, no static current except the leakage current flows through the internal gates of the device. The amount of this leakage current is, however, in the range of tens of nano amperes, which is negligible.

The other is DC current that flows through the input and output buffers when the circuit is interfaced with other devices, especially TTL. The current of pull-up/pull-down transistor included in the input buffers is about 50μA typically, which is also negligible. Therefore, only DC current that the output buffers source or sink has to be counted to estimate the total static power dissipation.

DC power dissipation of TTL output and bi-directional buffers is determined by the following formula:

$$P_{DC\_TTL\_OUTPUT} = \Sigma(V_{OL} \times I_{OL} \times t_L) + \Sigma((V_{DD} - V_{OH}) \times I_{OH} \times t_H)$$

,where

$t_H = T_{HIGH} / T$,

$t_L + t_H = 1$.

Dynamic (AC) Power Dissipation

When a CMOS gate changes its state, it draws switching current as a result of charging or discharging of a node capacitance, C_L. The energy associated with the switching current for a node capacitance, C_L, is

$$1 / 2 \times (C_L \times V_{DD}^2)$$

,where V_{DD} is a power supply voltage.

The switching occurs twice per cycle for periodic signals: once for charging a capacitance and once for discharging it. Hence, the dynamic power dissipation due to the switching current is the energy divided by the clock period and multiplied by the factor of two, or

$$C_L \times V_{DD} \times V_{DD} / T$$

,where T is a clock period.

As shown above, it is quite straight forward to calculate the dynamic power dissipation for a single gate. The dynamic power dissipation for an entire chip is, however, much more complicated to estimate since it depends on the degree of switching activity of the circuit. SEC has found that the degree of switching activity is 20% on the average and recommends to use this number to estimate the total dynamic power dissipation.

Power Dissipation in KG80/KGM80

This section describes the equations on how to estimate the power dissipation in KG80/KGM80. As explained in the previous section, the total power dissipation (P_{TOTAL}) consists of static power dissipation (P_{DC}) and dynamic power dissipation (P_{AC}).

$$P_{TOTAL} = P_{DC} + P_{AC}$$

Since only output buffers contribute to the static power dissipation,

$$P_{DC} = P_{DC\_OUTPUT}$$

,where P_{DC} output is the static power dissipated when output buffers source or sink.

The dynamic power dissipation is caused by three components: input buffers (P_{AC_INPUT}), output buffers (P_{AC_OUTPUT}), and internal cells ($P_{AC\_INTERNAL}$).

$$P_{AC} = P_{AC\_INPUT} + P_{AC\_OUTPUT} + P_{AC\_INTERNAL}$$

Each term mentioned above is characterized by the following equations:

In KG80,

$P_{DC\_OUTPUT} = 150 \times I_{OL} \times N\_output$ [µW]
$P_{AC\_INPUT} = 23 \times N\_input \times F \times S$ [µW]
$P_{AC\_OUTPUT} = 25 \times N\_output \times F \times S \times C$ [µW]
$P_{AC\_INTERNAL} = 2.3 \times N\_internal \times F \times S$ [µW]

In KGM80,

$P_{DC\_OUTPUT} = 150 \times I_{OL} \times N\_output$ [µW]
$P_{AC\_INPUT} = 9.8 \times N\_input \times F \times S$ [µW]
$P_{AC\_OUTPUT} = 25 \times N\_output \times F \times S \times C$ [µW]
$P_{AC\_INTERNAL} = 1.2 \times N\_internal \times F \times S$ [µW]

,where
I_{OL} is source and sink current of output buffers in mA,
N_output is the number of output buffers used,
N_input is the number of input buffers used,
N_internal is the number of internal cells used,
F is the maximum operation frequency in MHz,
S is the estimated degree of a switching activity (typically 0.2),
C is the output load capacitance in pF.

Temperature and Power Dissipation

The total power dissipation, P_{TOTAL} can be used to find out the device temperature by the following equation:

$$\theta_{JA} = (T_J - T_A) / P_{TOTAL}$$

,where
θ_{JA} is the thermal impedance,
T_J is the junction temperature of the device,
T_A is the ambient temperature.

Thermal impedances of the SEC packages are given in the following table. The junction temperature, obtained by multiplying P_{TOTAL} by the appropriate θ_{JA} and adding T_A, determines the derating factor for the propagation delays and also indicates the reliability measures.

Hence, designers can achieve the desired derating factor and reliability targets by choosing appropriate packages and system cooling methods.

Table 1-2. Thermal Impedances of SEC Packages

	QFP						
Pin Number	**64**	**80**	**100**	**120**	**160**	**208**	**240**
θ_{JA} [°C/W]	60	60	60	50	50	40	40

Maximum Junction Temperature (T_J)

The allowable maximum junction temperatures for plastic and ceramic packages are as follows:

Junction temperature for plastic package ≤ 125°C
Junction temperature for ceramic package ≤ 150°C.

PROPAGATION DELAYS

Interconnection wire length, temperature and supply voltage are the chief factors affecting propagation delays.

Wire Length Load

The loading due to interconnection wire length can be estimated with the following expression. The result is given in terms of number of equivalent standard loads.

$$C_{WL} = C_{FO} \times (0.049 \times \sqrt{A} + 0.48) + 0.079 \times \sqrt{A} + 0.33$$

,where

C_{FO} = Number of fanouts in a standard load,

A = Area of block size in mm^2,

C_{WL} = Number of equivalent standard loads due to an interconnection,

e.g.,

C_{FO} = 7 (standard load),

A = 25mm^2,

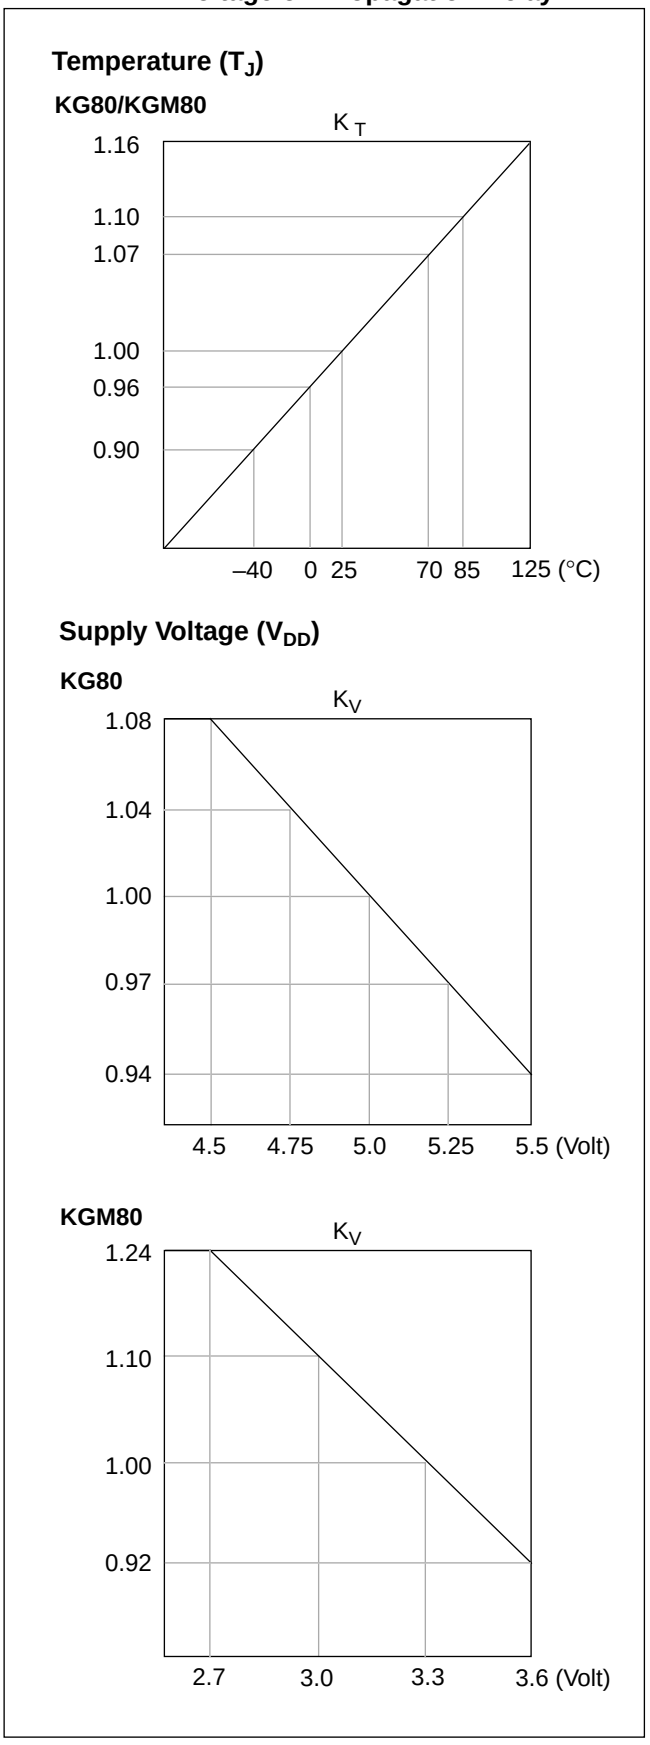
C_{WL} = 5.8 (standard load).

Temperature and Supply Voltage

The next figure describes propagation delay correction factors (K_T, K_V) as a function of on-chip junction temperature (T_J) as well as supply voltage (V_{DD}). As a result of increasing CMOS power dissipation, ambient and junction temperature are generally not the same.

The temperature of the die inside the package (junction temperature, T_J), is calculated using chip power dissipation and the thermal resistance to ambient temperature (θ_{JA}) of the package. Information on package thermal performance can be obtained from SEC application engineers.

Figure 1-6. Effect of Temperature and Supply Voltage on Propagation Delay



Best and Worst Case Conditions

A circuit should be designed to operate properly within a given specification level, either commercial or industrial. It is recommended that circuits be simulated for best case, normal case, and worst case conditions at each specification level.

The following expressions also allow for the effect of process variation on circuit performance.

Best case:

$T_{BC} = K_{PBC} \times K_T \times K_V \times T_{NOM} = K_{BC} \times T_{NOM}$

Worst case:

$T_{WC} = K_{PWC} \times K_T \times K_V \times T_{NOM} = K_{WC} \times T_{NOM}$

,where

T_{BC} = Best case propagation delay

T_{WC} = Worst case propagation delay

T_{NOM} = Normal propagation delay

($T_J = 25^oC$, $V_{DD} = 5V$ and typical process)

K_{PWC} = Worst case process correction factor

K_{PBC} = Best case process correction factor

With above equations, we can calculate the multipliers of K_{WC} and K_{BC} as follows.

Table 1-3. KG80 best case delay

Application	Best case delay			
	Parameter			K_{BC}
	V_{DD}	T_J	Proc.	
Industrial	5.5V	–40 °C	Min.	0.51
Commercial	5.25V	0 °C	Min.	0.56

Table 1-4. KG80 worst case delay

Application	Worst case delay			
	Parameter			K_{WC}
	V_{DD}	T_J	Proc.	
Industrial	4.5V	125 °C	Max.	1.75
Commercial	4.75V	115 °C	Max.	1.66

Table 1-5. KGM80 best case delay

Application	Best case delay			
	Parameter			K_{BC}
	V_{DD}	T_J	Proc.	
Industrial	3.6V	–40 °C	Min.	0.50
Commercial	3.6V	0 °C	Max.	0.53

Table 1-6. KGM80 worst case delay

Application	Worst case delay			
	Parameter			K_{WC}
	V_{DD}	T_J	Proc.	
Industrial	2.7V	125 °C	Max.	2.02
Commercial	3.0V	115 °C	Max.	1.77

Derating factors of KG80/KGM80

The multipliers can be applied to nominal delay data in order to estimate the effects of supply voltage, temperature and process. Nominal data are provided for conditions of $V_{DD} = 5V$, $T_A = 25°C$ and typical process.

The derating factors of KG80/KGM80 are as follows.

Table 1-7. KG80/KGM80 process derating factor

Process Factor (K_P)	Slow	Typ.	Fast
	1.40	1.00	0.60

Table 1-8. KG80 temperature derating factor

Temp. (°C)	125	85	70	25	0	–40
K_T	1.16	1.10	1.07	1.00	0.96	0.90

Table 1-9. KGM80 temperature derating factor

Temp. (°C)	125	85	70	25	0	–40

Table 1-11. KGM80 voltage derating factor (K_V)

Voltage (V)	3.6	3.3	3.0	2.7
K_V	0.92	1.00	1.10	1.24

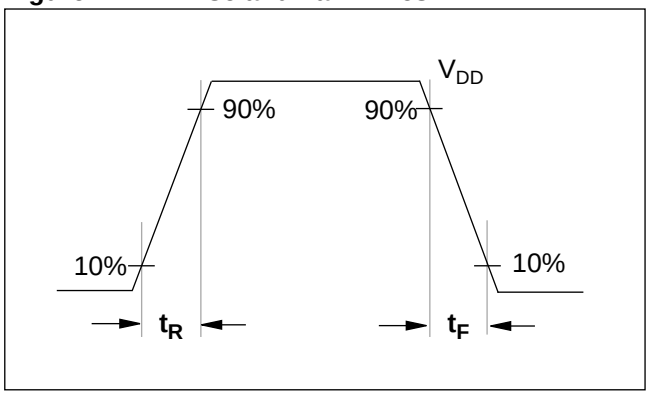
Timing Parameters

This section discusses issues involving timing parameters for primitive cells.

RISE / FALL TIMES

The definition of rise time (t_R) and fall time (t_F) is shown in the following figure.

Figure 1-7. Rise and Fall Times

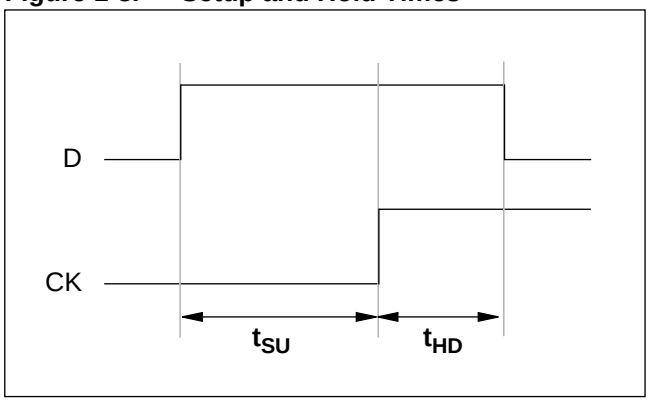


SETUP / HOLD TIMES

Setup time (t_{SU}) is a minimum period in which the input data to a flip-flop or a latch must be stable before the active edge of the clock occurs. Hold time (t_{HD}) is a minimum period in which the input data to a flip-flop or a latch must remain stable after the active edge of the clock has occurred.

The next figure shows the relationship between setup and hold times for a standard flip-flop triggered on the rising edge of the clock.

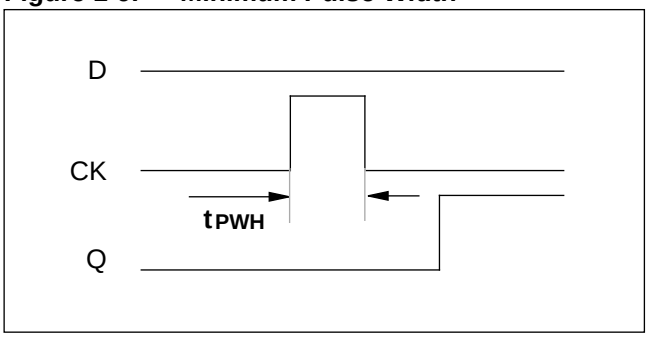
Figure 1-8. Setup and Hold Times



MINIMUM PULSE WIDTHS

Minimum clock pulse widths (t_{PWH}, t_{PWL}) are the time intervals during a clock signal is high or low, so that it ensures proper operation of a flip-flop or a latch.

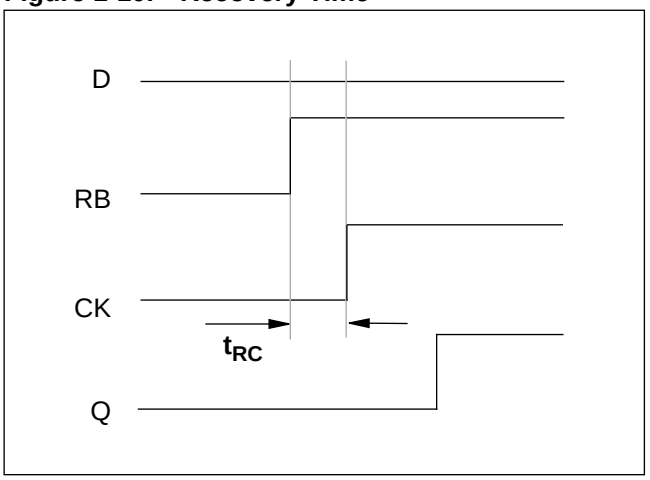
Figure 1-9. Minimum Pulse Width



RECOVERY TIMES

Recovery time (t_{RC}) is the minimum time after an asynchronous pin is disabled that an active clock edge will propagate data from input to output. If the active edge or clock occurs before the specified recovery time, the input data will not propagate.

Figure 1-10. Recovery Time

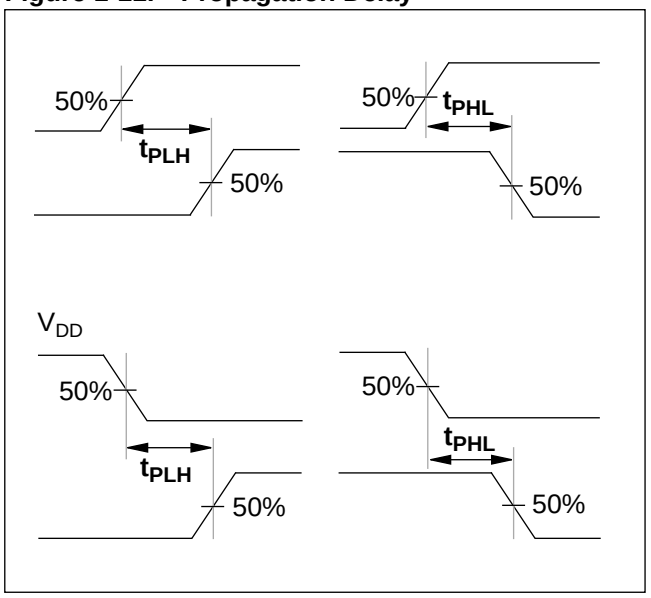


PROPAGATION DELAYS

A delay for a macrocell is considered to be a rising delay (t_{PLH}) if the signal on the output pin is rising. For a rising input and a rising output, the rising delay is the interval between the times the input becomes 50% of supply voltage (V_{DD}) and the output becomes 50% of V_{DD}.

If the input is falling and the output is rising, the rising delay is the interval between the times the input falls to 50% of V_{DD} and the output rises to 50% of V_{DD}. The converse is true for a falling delay (t_{PHL}).

Figure 1-11. Propagation Delay

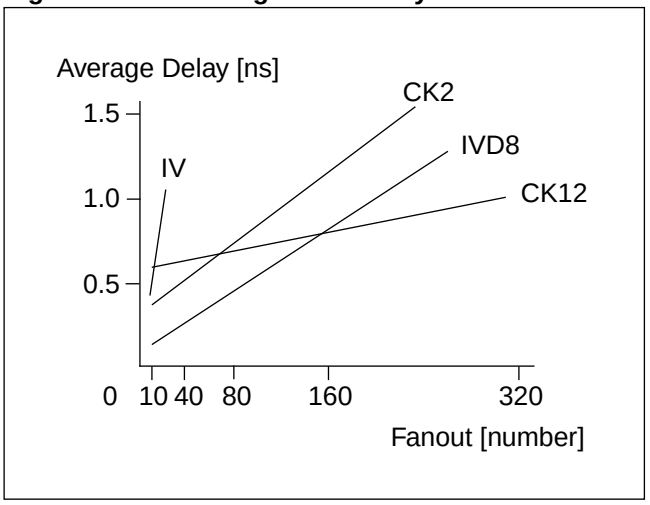


Proper Use of Buffers

Figure 1-12. Average Gate Delay in KG80 shows the average propagation delays of an internal inverter (IV), an 8X inverter (IVD8), a normal clock driver (CK2), and a high clock driver (CK12) in KG80.

Note that transistors uses in I/O slots are larger and have ON channel resistance about one order of magnitude lower than those of the N and P channel transistors in primitive cells. This makes them likely candidates for use as buffers for high fanout signals. For example, CK2 and CK12 buffers require one I/O slot location. Both can be used as high fanout internal buffers.

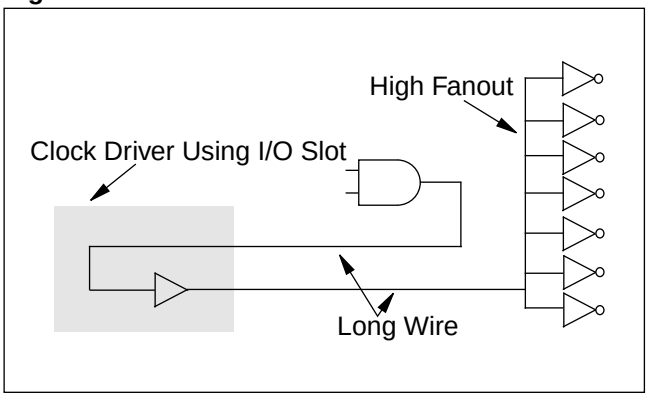
Figure 1-12. Average Gate Delay in KG80



One caution, emphasized in Figure 1-13. Use of I/O Slot for an Internal Buffer, shows that if you route to a buffer that uses an I/O slot from an internal element and back into internal logic, the additional wiring needed could increase propagation delays materially. Higher drive strength internal cells may be more appropriate than I/O slot buffers.

Realize also that using I/O slot cells for internal buffering removes those locations for use as external I/Os and uses two wiring channels, thereby increasing routability congestion on masterslice products.

Figure 1-13. Use of I/O Slot for an Internal Buffer



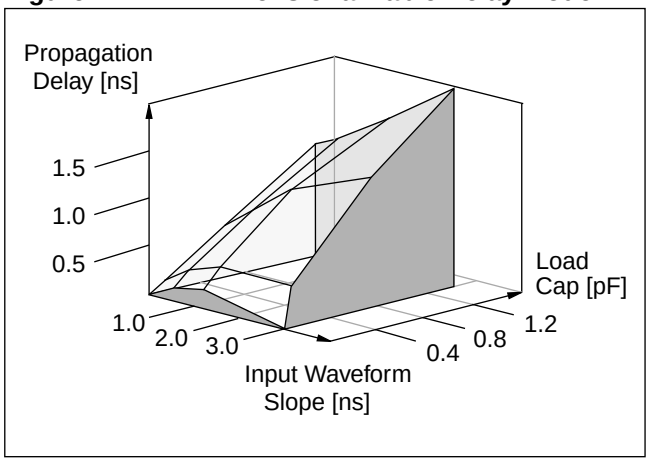
DELAY MODEL

The ASIC timing characteristics consist of the following components:

- Cell propagation delay from input to output transitions based on input waveform slope, fanout loads and distributed interconnection wire resistance and capacitance.
- Interconnection wire delay across the metal lines.
- Timing requirement parameters such as setup time, hold time, recovery time, skew time, minimum pulse width, etc.
- Derating factors for junction temperature, power supply voltage, and process variations.

Timing model for KG80/KGM80 focuses on how to characterize cell propagation delay time accurately. To accomplish this goal, 2-dimensional table look-up delay model has been adopted. The index variables of this table are input waveform slope and output load capacitance. See the figure below. SEC ASIC design automation system supports an n-dimensional table model even though we adopted 2-dimensional model for our 0.5μm cell-based products.

Figure 1-14. 2-Dimensional Table Delay Model



The Table 1-12. Table Delay Model Example shows an example of this model for 2-input NAND cell. The data in this table are high-to-low transition delay times from one of the two input pins to output pin. The number of points and values of the index variables can differ for each cell.

Table 1-12. Table Delay Model Example

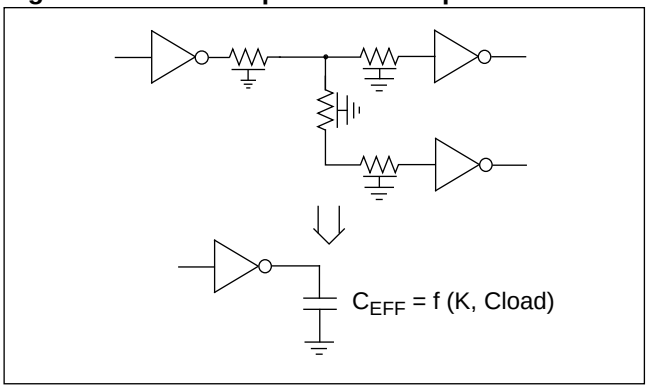
Slope \ Cap.	0.03	0.13	0.53	1.32
0.10	0.07	0.14	0.42	0.97
0.30	0.08	0.17	0.45	1.02
0.80	0.06	0.18	0.51	1.07
1.60	0.01	0.18	0.60	1.18

Notice that 4-by-4 table is used. Delay values between grid points and beyond this table are determined by linear interpolation and extrapolation methods. This general table delay model provides great flexibility as well as high accuracy since extensive software revisions are not required when a cell library is updated. The other timing components such as interconnection wire delay, timing requirement parameters and derating factors are characterized in a commonly-accepted way in industry.

The delay time due to the interconnection wire can be separated into two components. One is the signal propagation delay time across the metal lines. This delay time component is computed through conventional RC analysis based on $\prod$-model. The other is an additional delay on the driving cell due to the wire load. The traditional way to compute this is based on the lumped capacitance model, ignoring wire resistance.

For sub-micron technology, this approximation cannot be accepted any more. The wire resistance has a shielding effect on the driving cell from load capacitances. An effective capacitance C_{EFF}, a single capacitance approximating distributed interconnection wire resistance and capacitance, is derived, as illustrated in the following figure. The compensation factor K, extracted for each cell, is a function of the length of interconnection wires and the layout topology. All these effects are merged to determine the effective capacitance and this value is used as an index of the table delay model.

Figure 1-15. Concept of Effect Capacitance



The figure below summarizes the features of SEC ASIC's delay model.

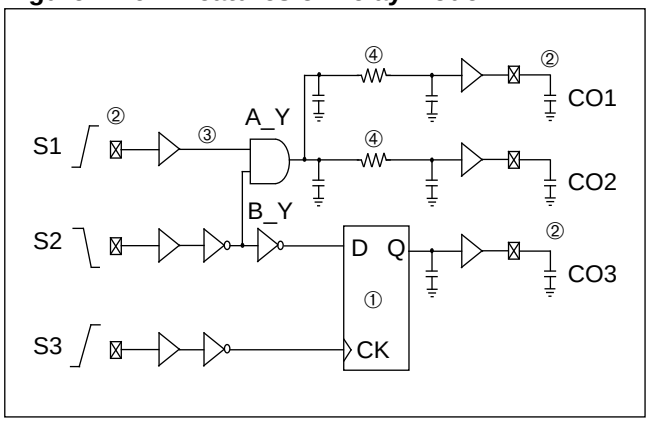
① 2-dimensional table delay model for output loading and input waveform slope effects is used. The slopes (t_R, t_F) and delay times (t_{PLH}, t_{PHL}) of all cell instances are calculated recursively.

② The input waveform slope of each primary input pad and the loading capacitance of each primary output pad can be assigned individually or by default.

③ Pin to pin delays of cells and interconnection wires are supported.

④ The effect of distributed interconnection wire resistance and capacitance on cell delay is analysed using the effective capacitance concept.

Figure 1-16. Features of Delay Model



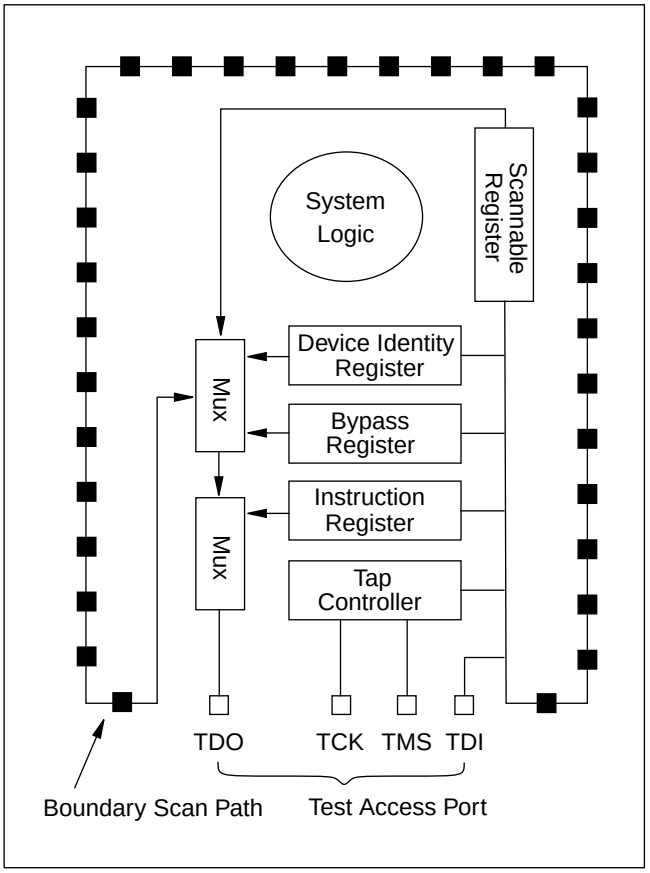
TESTABILITY DESIGN METHODOLOGY

Scan Design

- Multiplexed scan flip-flop that minimizes the area or delay overhead needed to implement scan design
- Automated design rules checking, scan insertion, and test pattern generation
- High fault coverage on synchronous designs

Boundary-Scan

- IEEE Std 1149.1
- 5 types of JTAG boundary-scan cells
- Boundary-Scan Description Language (BSDL) description for board testing
- Combination with internal scan design



MAXIMUM FANOUTS

Internal Macrocells

The maximum fanouts for KG80/KGM80 primitive cells are as follows. Note that these fanout limitation values are calculated when the rise and fall times of the input signal is 0.40 ns. Depending on the rise and fall times, the maximum fanout limitations can be varied case by case.

In the following table the maximum fanout values for all pins of KG80/KGM80 internal macrocells are listed.

Table 1-13. Maximum Fanouts of Internal Macrocells (When t_R/t_F = 0.40 ns)

PRODUCT LINE-UP

(The information below is preliminary, and can be changed or added by SEC ASIC.)

Table 1-15. KG80/KGM80 Masterslices (100μm Pad Pitch)

Device	Total Gates	Usable Gates		Total Pads
		DLM	TLM	
KG8563D	56,950	22,800	31,300	100
KG8144D	145,306	51,000	73,000	160
KG8244D	242,604	73,000	109,000	208
KG8444D	443,190	111,000	177,000	280

NOTES:

1. Usable gates are estimated; the actual number of usable gates is design-dependent.
2. I/O pads can be used as V_{DD}/V_{SS} pads.
3. Each clock driver cell occupies one I/O slot.
4. Total pad count includes the corner power pads.

PACKAGES

(The information below is preliminary, therefore, when you choose a package type for your product, or if you want to use the other types of packages, please contact to SEC ASIC.)

Table 1-16. Package Options

Type	DIP				SDIP									SOP		PLCC					QFP

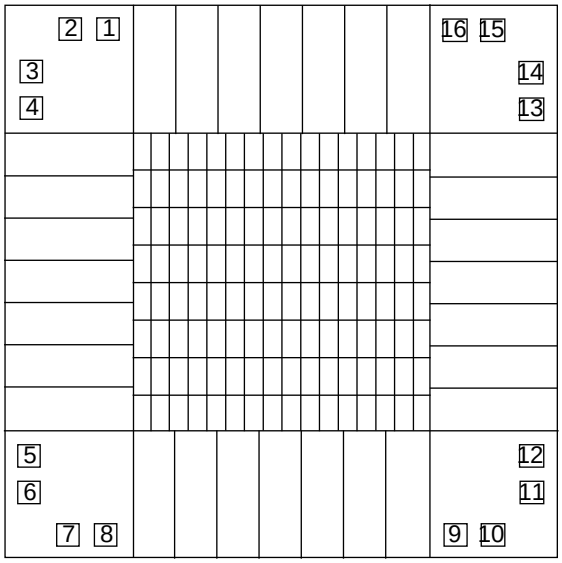
KG8444D																			o					o		o	o	o	o	o	0

NOTE: "o"-marked packages are fully guaranteed by SEC ASIC, and "A"-marked are available but not guaranteed since they are not completed passed bonding rule test.

DEDICATED CORNER V_{DD}/V_{SS} PADS

The corner pads shown in the following figure are well-suited for double bonding purposes. Pad 1 and pad 2 can be bonded to the same package pin. Unlike normal I/O pads, these pads can only be used for V_{DD}/V_{SS} listed in Table 1-17. Use of Corner Pads.

Figure 1-19. V_{DD}/V_{SS} Corner Pads



NOTES:

1. There is no dedicated corner VSSI pad. Therefore, internal V_{SS} must be supplied using I/O pad type cell.
2. Corner pads are used to reduce the power/ground noise when some parts of the design cause noise problem especially while the other parts keep quiet.

EXTERNAL DESIGN INTERFACE CONSIDERATIONS

This section briefly describes what you should consider when chips interface with outside world especially for a noise protection.

Input Buffer

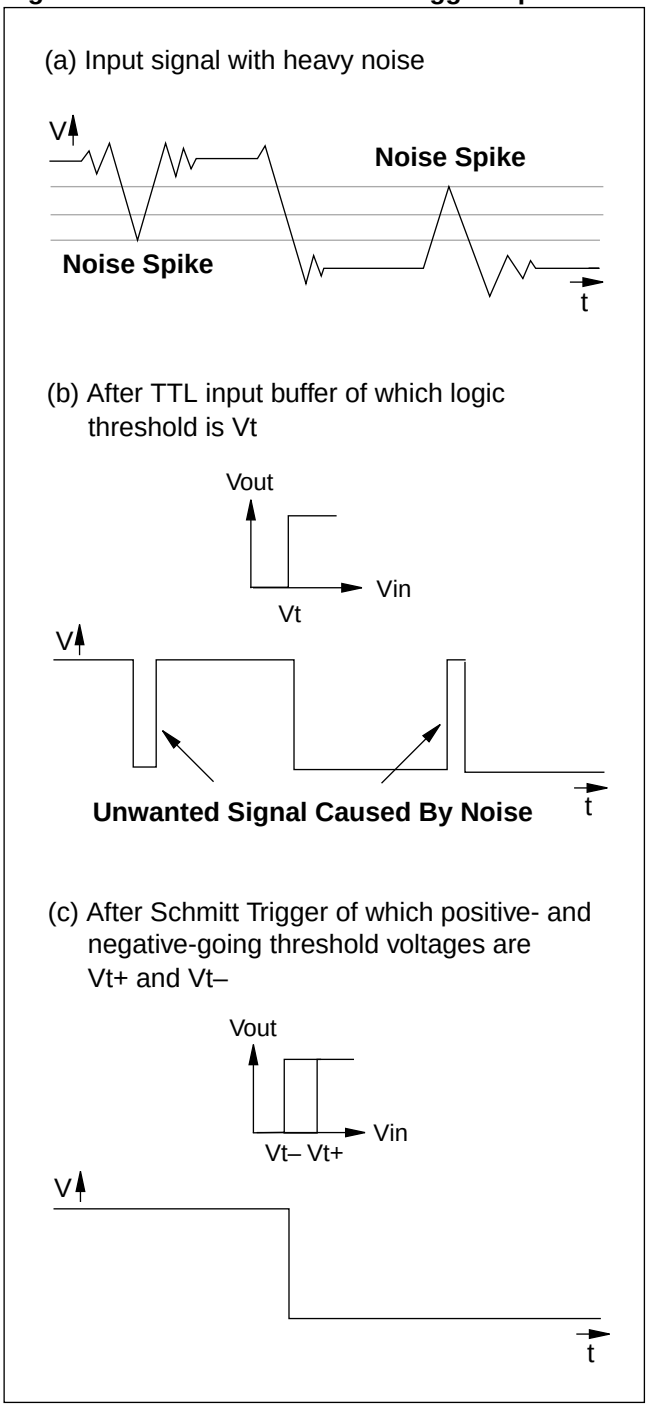
Usually there are three types of input receivers in ASIC libraries; TTL input buffer, CMOS input buffer, and various Schmitt trigger input buffers.

TTL input buffer has relatively poor noise characteristics because of its shifted logic threshold voltage. CMOS input buffer is better than TTL against a noise because the logic threshold voltage is near 2.5volt. If an input signal has relatively large noise spikes, it could cause an unwanted input signal.

When an input signal is very noisy, the noise can be filtered by using a Schmitt trigger input buffer. As shown in Figure 1-20. Effect of Schmitt Trigger Input Buffer, Schmitt trigger input buffers have two different input thresholds for positive- and negative-going signals. This hysteresis between positive- and negative-going voltage signals can filter a noisy signal to a wanted one.

According to applications, the most suitable one can be chosen among the various Schmitt trigger input buffers having different levels of threshold voltage.

Figure 1-20. Effect of Schmitt Trigger Input Buffer



Output Pad Cell

As incoming signals to a chip have a noise, the noise can also be induced by the operation of the chip itself. There are several sources of a noise, but the greatest singular source of a noise is the switching of an output with high capacitive load.

Figure 1-21. Simple Model of Output Pad Cell

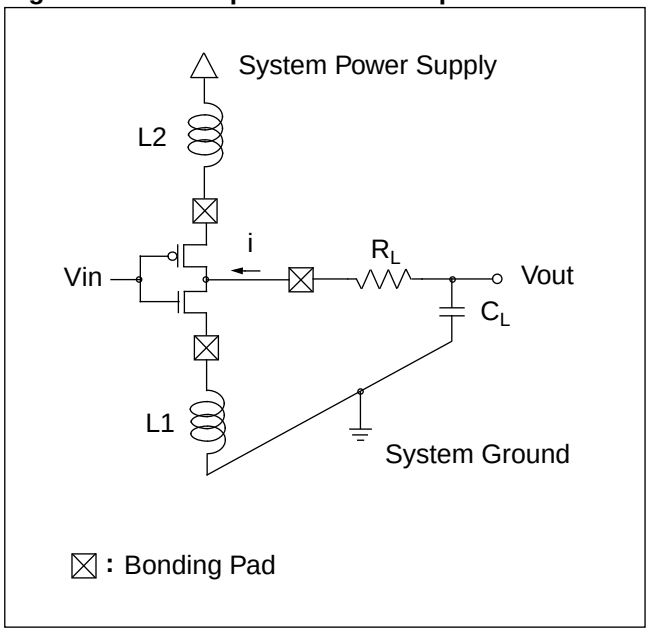


Figure 1-21. Simple Model of Output Pad Cell shows the simple model of an output driver considering the external interface. L1 and L2 are parasitic inductances of the package and C_L is an output load. Vout will fall as Vin rises and the current i flows through n-transistor discharging the loaded charge ($V_{DD} \times C_L$).

The details of this operations are described in Figure 1-22. Ground Bounce Phenomenon.

The important phenomenon which can be observed in this figure is that the voltage level Vn shifts relative to the system ground. Vn is the ground of the chip.

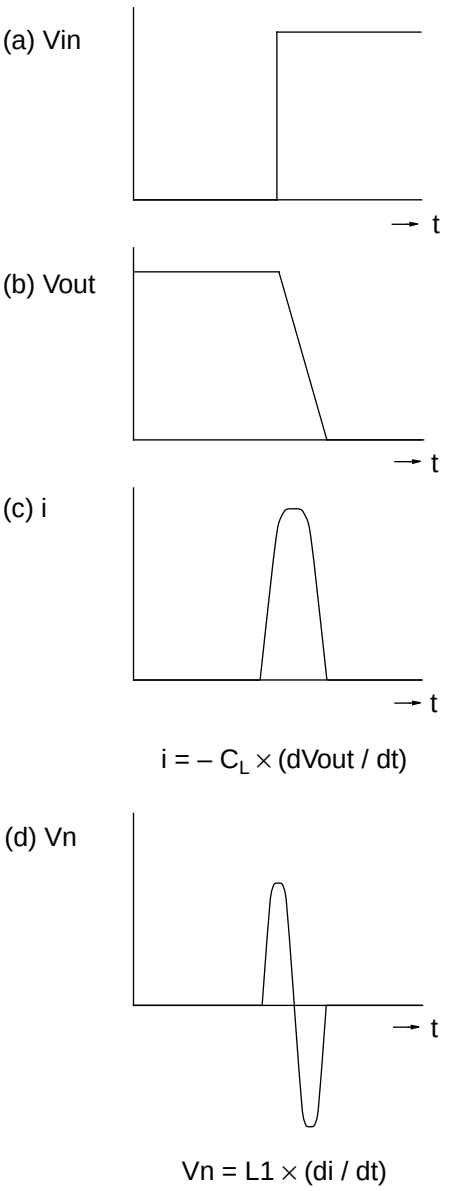
This phenomenon is called as a “ground bounce” that is the chip reference shift caused by the external inductance and the transient current flow to the ground.

The amount of voltage level shifted by the ground bounce is

$$Vn = -L \times (di / dt)$$

When the output driver makes a low-to-high transition, the similar noise problem is generated on the power.

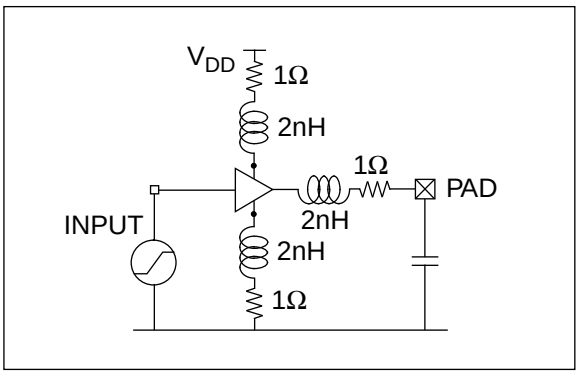
Figure 1-22. Ground Bounce Phenomenon



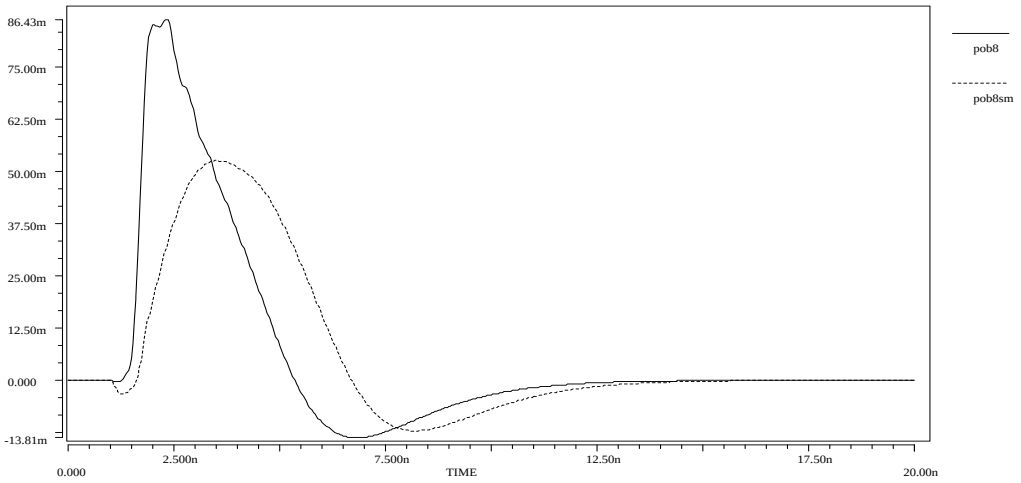
The following graphs show typical AC characteristics of non-slew and slew-rate output drives in KG80/KGM80. Using the slew-rate control, you can reduce the switching noise.

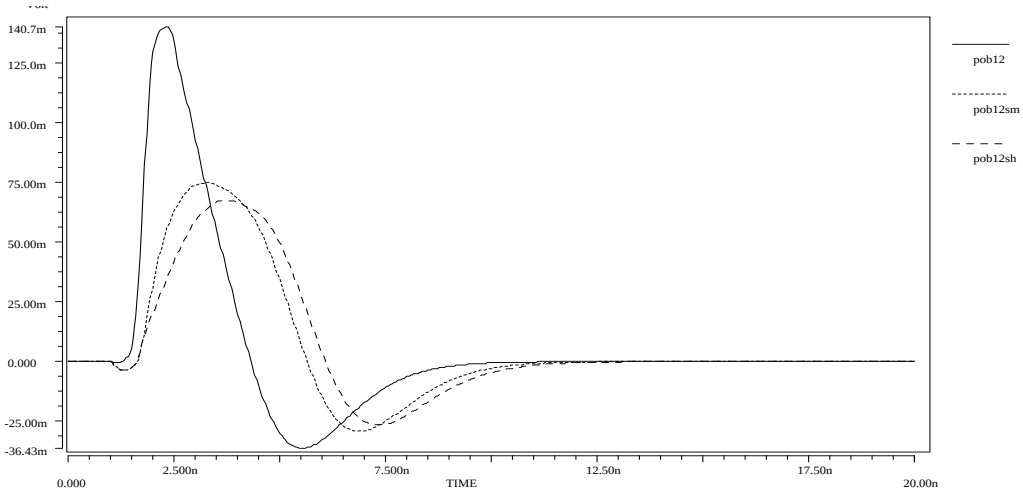
Figure 1-23. AC Characteristics of Non-Slew and Slew Rate Output Drives

< Test Condition >

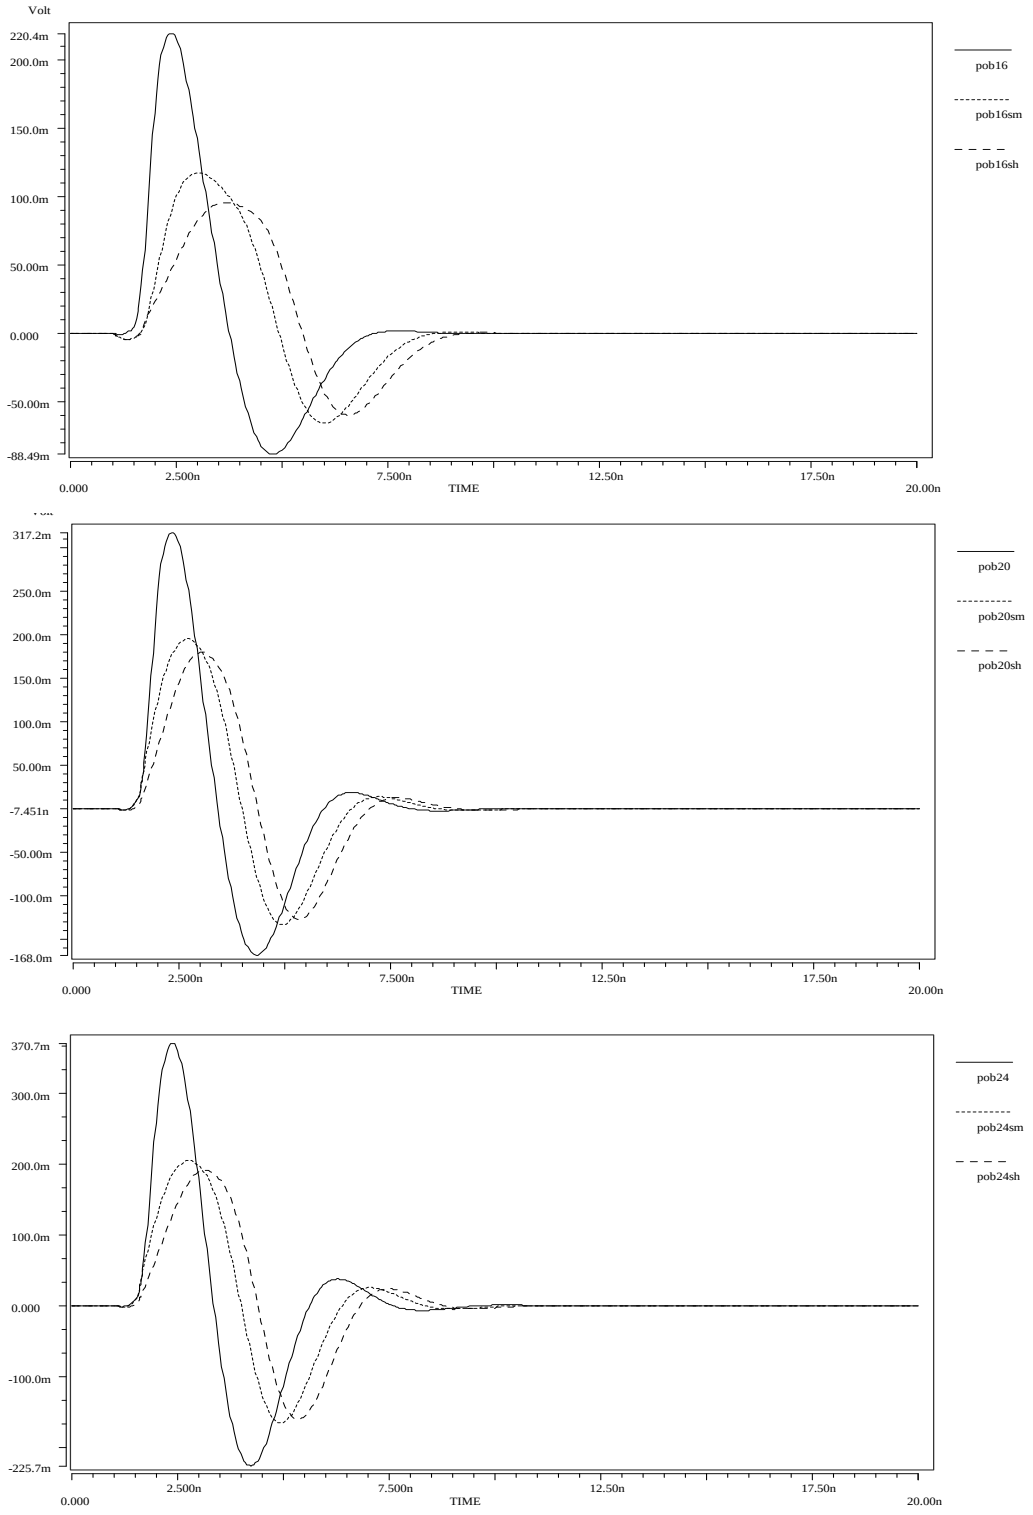


Ground Bouncing Voltage vs. Time





Ground Bouncing Voltage vs. Time



Simultaneous Switching Outputs (SSOs)

If several output drivers switch from high to low simultaneously, the ground bouncing level becomes quite large because the current flowing through the inductance L is the total sum of the transient current of each output driver. The amount of total current and the level of ground bounce are proportional to the number of SSOs.

This ground bounce can cause two types of problems, a noise margin reduction and a generation of noise spike on the output pad.

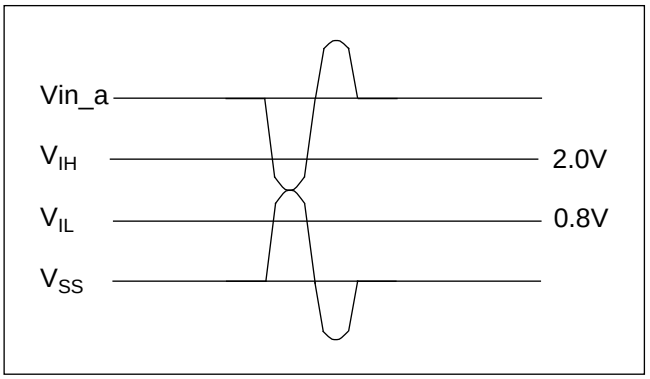
NOISE MARGIN REDUCTION

The ground bounce can cause a noise margin reduction when the same ground bus is used for both input buffers and output drivers as shown in Figure 1-25. The Figure of SSOs. The noise margin reduction can be explained using the circuit in the same figure.

As you can see, if outputs switch from high to low simultaneously, it results in a ground bounce or the rise of the chip ground level relative to system ground. The rise appears as the input voltage Vin_a is below V_{IH} causing false triggering of the input buffer. Vin is, in this case, not the same as Vin_a. Note that Vin is measured relative to the system ground, while Vin_a is measured relative to the local device ground.

This phenomenon is shown in Figure 1-24. Noise Margin Reduction due to SSOs. For a low-to-high transition, it is the low input levels (V_{IL}) that are affected.

Figure 1-24. Noise Margin Reduction due to SSOs

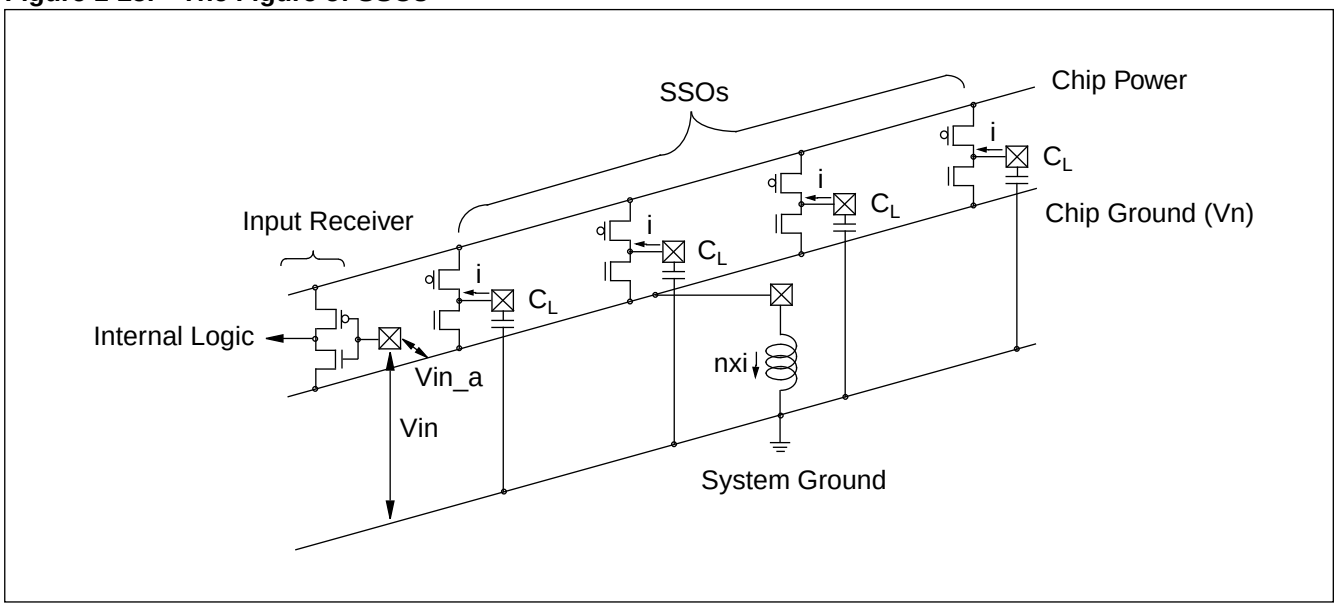


NOISE SPIKE GENERATION ON STABLE OUTPUT

If input and output power buses are separated, the problem of a noise margin reduction in the input buffer can be solved. However, ground bounce can cause another problem in spite of using separated power and ground bus.

The Figure 1-26. Noise Spike Induced by Ground Bounce shows a common octal driver application where ground bounce spikes will be observable on the one stable output. If the spike is considered as high by another chip, this ground bounce may upset that operation of interfacing device or cause system logic errors.

Figure 1-25. The Figure of SSOs



For example, suppose C_L = 100pF, V_{DD} = 3.3Volt, t_F = 5ns. From Figure 1-22. Ground Bounce Phenomenon, the maximum current flow occurs at time $0.5 \times t_F$. Then approximately,

$i = C_L \times (dv / dt) \cong C_L \times (\Delta V / \Delta t)$,
and

$i\ (max) = 100 \times 10^{-12} \times \{5 / (2.5 \times 10^{-9})\} = 200$ [mA].

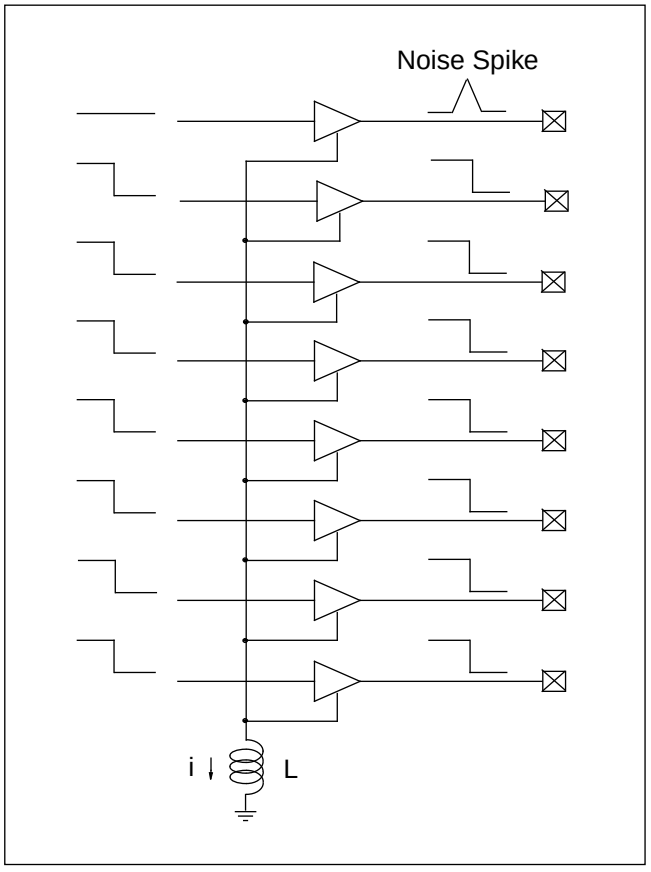
If the number of SSOs is 5, and L is 4nH,

$Vn = L \times (di / dt) \times N \cong L \times (\Delta i / \Delta t) \times N$ by approximation,

$Vn\ (max) = 4 \times 10^{-9} \times \{0.200 / (2.5 \times 10^{-9})\} \times 5 = 1.60$ [Volt].

From this calculation, 1.60V of noise spike is expected. This is about logic threshold voltage of TTL. This numerical estimate clearly shows that power bus noise control is one of the fundamental problems in a high-speed CMOS VLSI design. It is an important design consideration to prevent the noise from affecting the integrity of the logic operation of a chip.

Figure 1-26. Noise Spike Induced by Ground Bounce



How to Protect Ground Bounce?

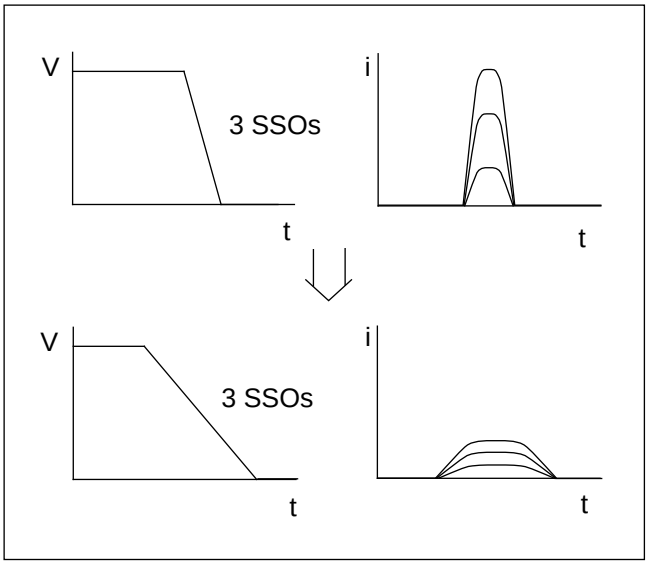
The fundamental solution to the ground bounce problem is to reduce the inductance of the package. However, in the boundary of a given packaging technology, the following guidelines can be used for reducing ground bounce:

(1) If possible, use separate power and ground buses for input buffers and output drivers.

(2) The number of ground and power pads should not be less than the required number of pads.

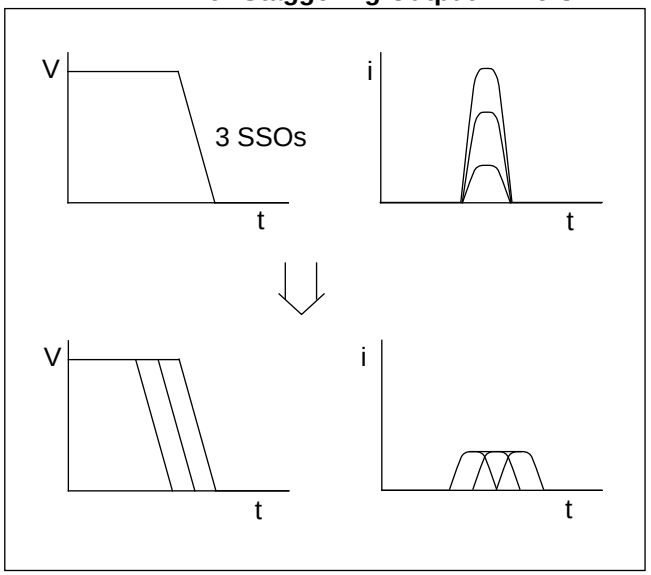
(3) If the design is not so much sensitive to speed, use slew rate control, i.e., increase switching time, to reduce the value of di / dt of an output driver. SEC supports two levels of slew rate controlled output buffers, SM and SH. You can see this effect in the following figure.

Figure 1-27. Effect on Reducing Peak Current with Slew-Rate Control



(4) If you cannot use a slew rate cell because of the speed requirement, you can stagger the output driver as shown in Figure 1-28. Effect on Reducing Peak Current with Staggering Output Drivers. This is not a general-purpose solution. It makes sense only when special relief in timing requirements exists from a system architecture.

Figure 1-28. Effect on Reducing Peak Current with Staggering Output Drivers



(5) High-drive outputs should be close to V_{SS} pins. SSOs should be placed particularly close to V_{SS} pins.

(6) SSOs should be appropriately placed in groups belonging to given V_{SS} pins.

(7) Noise-sensitive signals such as clock, asynchronous clear and preset should be located away from SSOs and high-drive outputs. Also, assign them to pins with low inductance and resistance, preferably near V_{SS}, if one is available away from SSOs or high-drive outputs.

(8) Place SSOs on low inductance pins, such as those located on the inner rows or middle positions of PGAs.

(9) Clock, preset and clear inputs must not be placed on the corners of a package, especially when the array is packaged in DIP.

(10) Output signals to be used as clock, preset or clear for other devices must be kept away from SSOs and close to V_{SS} pin.

These guidelines assist you in choosing the best package(s) for the application. Furthermore, the recommendations about pinout results in reliable and predictable devices that minimizes harmful DC and AC effects on the system.

CRYSTAL OSCILLATOR CONSIDERATIONS

Overview

KG80/KGM80 contains a circuit commonly referred to as an “on-chip oscillator.” The on-chip circuit itself is not an oscillator but an amplifier which is suitable for being used as the amplifier part of a feedback oscillator. With proper selection of off-chip components, this oscillator circuit performs better than any other types of clock oscillators.

It is very important to select suitable off-chip components to work with the on-chip oscillator circuitry. It should be noted, however, that SEC cannot assume the responsibility of writing specifications for the off-chip components of the complete oscillator circuit, nor of guaranteeing the performance of the finished design in production, anymore than a transistor manufacturer, whose data sheets show a number of suggested amplifier circuits, can assume responsibility for the operation, in production, of any of them.

We are often asked why we don’t publish a list of required crystal or ceramic resonator specifications, and recommend values for the other off-chip components. This has been done in the past, but sometimes with consequences that were not intended.

Suppose we suggest a maximum crystal resistance of 30 ohms for some given frequency. Then your crystal supplier tells you the 30 ohm crystals are going to cost twice as much as 50 ohm crystals. Fearing that SEC will not “guarantee operation” with 50 ohm crystals, you order the expensive ones.

In fact, SEC guarantees only what is embodied within an SEC product. Besides, there is no reason why 50 ohm crystals couldn’t be used, if the other off-chip components are suitably adjusted.

Should we recommend values for the other off-chip components? Should we do for 50 ohm crystals or 30 ohm crystals? With respect to what should we optimize their selection? Should we minimize start-up time or maximize frequency stability?

In many applications, neither start-up time nor frequency stability is particularly critical, and our “recommendations” are only restricting your system to unnecessary tolerances. It all depends on the application.

Oscillator Design Considerations

ASIC designers have a number of options for clocking the system. The main decision is whether to use the "on-chip" oscillator or an external oscillator. If the choice is to use the on-chip oscillator, what kinds of external components are to use an external oscillator, what type of oscillator would it be?

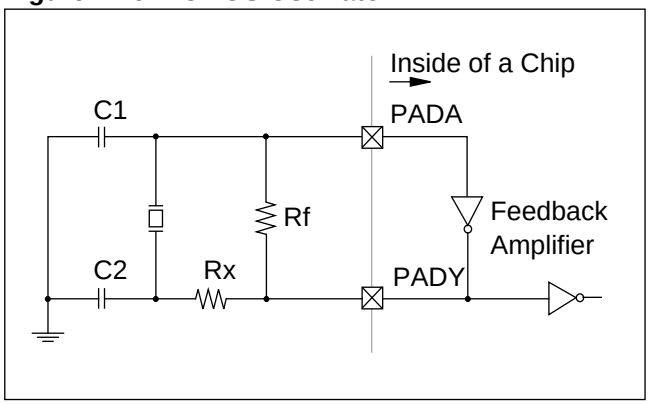
The decisions have to be based on both economic and technical requirements. In this section we will discuss some of the factors that should be considered.

ON-CHIP OSCILLATOR

In most cases, the on-chip amplifier with the appropriate external components provides the most economical solution to the clocking problem. Exceptions may arise in server environments when frequency tolerances are tighter than about 0.01%.

The external components that commonly used for CMOS gate oscillator are a positive reactance (normal crystal oscillator), two capacitors, C1 and C2, and two resistor Rf and Rx as shown in the figure below.

Figure 1-29. CMOS Oscillator



CRYSTAL SPECIFICATIONS

Specifications for an appropriate crystal are not very critical, unless the frequency is. Any fundamental-mode crystal of medium or better quality can be used.

We are often asked what maximum crystal resistance should be specified. The best answer to that question is the lower the better, but use what is available.

The crystal resistance will have some effect on start-up time and steady-state amplitude, but not so much that it can't be compensated for by appropriate selection of the capacitances, C1 and C2.

Similar questions are asked about specifications of load capacitance and shunt capacitance. The best advice we can give is to understand what these parameters mean and how they affect the operation of the circuit (that being the purpose of this application note), and then to decide for yourself if such specifications are meaningful in your frequency tolerances are tighter than about 0.1%.

Part of the problem is that crystal manufacturers are accustomed to talking "ppm" tolerances with radio engineers and simply won't take your order until you've filled out their list of frequency tolerance requirements, both for yourself and to the crystal manufacturer. Don't pay for 0.003% crystals if your actual frequency tolerance is 1%.

OSCILLATION FREQUENCY

The oscillation frequency is determined 99.5% by the crystal and up to about 0.5% by the circuit external to the crystal.

The on-chip amplifier has little effect on the frequency, which is as it should be, since the amplifier parameterizes temperature and process dependent.

The influence of the on-chip amplifier on the frequency is by means of its input and output (pin-to-ground) capacitances, which parallel C1 and C2, and the PADA-to-PADY (pin-to-pin) capacitance, which parallels the crystal. The input and pin-to-pin capacitances are about 7 pF each.

Internal phase deviations capacitance of 25 to 30 pF. These deviations from the ideal have less effect in the positive reactance oscillator (with the inverting amplifier) than in a comparable series resonant oscillator (with the non-inverting amplifier) for two reasons: first, the effect of the output capacitor; second, the positive reactance oscillator is less sensitive, frequency-wise, to such phase errors.

C1 / C2 SELECTION

Optimal values for the capacitors C1 and C2 depend on whether a quartz crystal or ceramic resonator is being used, and also on application-specific requirements on start-up time and frequency tolerance.

Start-up time is sometimes more critical in microcontroller systems than frequency stability, because of various reset and initialization requirements.

Less commonly, accuracy of the oscillator frequency is also critical, for example, when the oscillator is being used as a time base. As a general rule, fast start-up and stable frequency tend to pull the oscillator design in opposite directions.

Considerations of both start-up time and frequency stability over temperature suggest that C1 and C2 should be about equal and at least 20pF. (But they don't have to be either.)

Increasing the value of these capacitances above some 40 or 50pF improves frequency stability. It also tends to increase the start-up time. These is a maximum value (several hundred pH, depending on the value of R1 of the quartz or ceramic resonator) above which the oscillator won't start up at all.

If the on-chip amplifier is a simple inverter, the user can select values for C1 and C2 between some 20 and 100pF, depending on whether start-up time or frequency stability is the more critical parameter in a specific application.

RF / RX SELECTION

A CMOS inverter might work better in this application since a large Rf (1mega-ohm) can be used to hold the inverter in its linear region.

Logic gates tend to have a fairly low output resistance, which testabilizes the oscillator. For that reason a resistor Rx (several k-ohm) is often added to the feedback network, as shown in Figure 1-29. CMOS Oscillator.

At higher frequencies a 20 or 30pF capacitor is sometimes used in the Rx position, to compensate for some of the internal propagation delay.

PIN CAPACITANCE

Internal pin-to-ground and pin-to-pin capacitances, and PADA and PADY have some effect on the oscillator. These capacitances are normally taken to be in the range of 5 to 10pF, but they are extremely difficult to evaluate. Any measurement of one such capacitance necessarily include effects from the others.

One advantage of the positive reactance oscillator is that the pin-to ground cap. is paralleled by an external bulk capacitance, so a precise determination of their value is unnecessary.

We would suggest that there is little justification for more precision than to assign them a value of 7pF (PADA-to-ground and PADA-to-PADY). This value is probably not in error by more than 3 or 4pF.

The PADY-to-ground cap. is not entirely a "pin capacitance", but more like an "equivalent output capacitance" of some 25 to 30pF, having to include the effect of internal phase delays. This value varies to some extent with temperature, process, and frequency.

PLACEMENT OF COMPONENTS

Noise glitches arising at PADA or PADY pins at the wrong time can cause a miscount in the internal clock-generating circuitry. These kinds of glitches can be produced through capacitive coupling between the oscillator components and PCB traces carrying digital signals with fast rise and fall times.

For this reason, the oscillator components should be mounted close to the chip and have short, direct traces to the PADA, PADY, and V_{SS} pins.

If possible, use dedicated V_{SS} and V_{DD} pin for only crystal feedback amplifier.

Troubleshooting Oscillator Problems

The first thing to consider in case of difficulty is that there may be significant differences in stray caps between the test jig and the actual application, particularly if the actual application is on a multi-layer board.

Noise glitches, that are not present in the test jig but are in the application board, are another possibility. Capacitive coupling between the oscillator circuitry and other signal has already been mentioned as a source of miscounts in the internal clocking circuitry. Inductive coupling is also doubtful, if there is strong current nearby. These problems are a function of the PCB layout.

Surrounding oscillator components with “quit” traces (for example, VCC and ground) will alleviate capacitive coupling to signals having fast transition time. To minimize inductive coupling, the PCB layout should minimize the areas of the loops formed by oscillator components.

The loops demanding to be checked are as follows:

PADA through the resonator to PADY;
PADA through C1 to the V_{SS} pin;
PADY through C2 to the V_{SS} pin.

It is not unusual to find that the ground ends of C1 and C2 eventually connect up to the V_{SS} pin only after looping around the farthest ends of the board. Not good.

Finally, it should not be overlooked that software problems sometimes imitate the symptoms of a slow-starting oscillator or incorrect frequency. Never underestimate the perversity of a software problem.

	Input buffer	$V_{IN} = V_{SS}$	–10	10	µA
	Input buffer with pull-up		–200	–10	
V_{OH}	High level output voltage				
	Type B1 to B24[Note1]	I_{OH} = –1µA	V_{DD} – 0.05		V
	Type B1	I_{OH} = –1mA	2.4		
	Type B2	I_{OH} = –2mA			
	Type B4	I_{OH} = –4mA			
	Type B8	I_{OH} = –8mA			
	Type B12	I_{OH} = –12mA			
	Type B16	I_{OH} = –16mA			
	Type B20	I_{OH} = –20mA			
	Type B24	I_{OH} = –24mA			
V_{OL}	Low level output voltage				
	Type B1 to B24	I_{OL} = 1µA		0.05	V
	Type B1	I_{OL} = 1mA		0.4	
	Type B2	I_{OL} = 2mA			
	Type B4	I_{OL} = 4mA			
	Type B8	I_{OL} = 8mA			
	Type B12	I_{OL} = 12mA			
	Type B16	I_{OL} = 16mA			
	Type B20	I_{OL} = 20mA			
	Type B24	I_{OL} = 24mA			
I_{OZ}	Tri-state output leakage current	$V_{OUT} = V_{SS}$ or V_{DD}	–10	10	µA
I_{DD}	Quiescent supply current	$V_{IN} = V_{SS}$ or V_{DD}		100[Note2]	µA

NOTES:

1. Type B1 means 1mA output driver cells, and Type B24 means 24mA output driver cells.
2. This value depends on the customer design.

V_{DD} = 3.3V ± 10%, T_A = 0 to 70°C

Symbol	Parameter	Condition	Min	Max	Unit
V_{IH}	High level input voltage				
	CMOS interface		$0.7V_{DD}$		V
	CMOS schmitt trigger			2.1	
V_{IL}	Low level input voltage				
	CMOS interface			$0.3V_{DD}$	V

OVERVIEW

The third chapter contains data sheets of logic cells, flip-flops, latches, bus holder, internal clock drivers, decoders, adders and multiplexers.

The electrical characteristics of each cell follows its basic cell data.

Summary tables in the following pages list the whole KG80/KGM80 internal macrocells by the type and show their reference page numbers for your convenience. Moreover, you can find the more detailed description tables on the leading pages of each category.

SUMMARY TABLES

Logic Cells

Cell Type	Cell Name	Page
AND Cell	AD2/AD2D2	3-11
	AD3/AD3D3	3-13
	AD4/AD4D2	3-16
	AD5/AD5D2	3-19
NAND Cell	ND2/ND2D2	3-22
	ND3/ND3D2	3-24
	ND4/ND4D2	3-27
	ND5/ND5D2	3-30
	ND6/ND6D2	3-33
	ND8/ND8D2	3-38
NOR Cell	NR2/NR2D2	3-43
	NR3/NR3D2	3-45
	NR4/NR4D2	3-48
	NR5/NR5D2	3-51
	NR6/NR6D2	3-54
	NR8/NR8D2	3-59
OR Cell	OR2/OR2D2	3-64
	OR3/OR3D3	3-66
	OR4/OR4D2	3-69
	OR5/OR5D2	3-72
Exclusive-NOR Cell	XN2/XN2D2	3-76
	XN3/XN3D3	3-78
Exclusive-OR Cell	XO2/XO2D2	3-81
	XO3/XO3D3	3-83
Combinational Cell of AND and NOR	AO21/AO21D2	3-86
	AO211/AO211D2	3-89
	AO22/AO22D2	3-92
	AO22A/AO22D2A	3-95
	AO222/AO222D2	3-98
	AO222A/AO222D2A	3-103
	AO33/AO33D2	3-106
	AO333/AO333D2	3-111

Cell Type	Cell Name	Page
Combinational Cell of OR and NAND	OA21/OA21D2	3-116
	OA211/OA211D2	3-119
	OA22/OA22D2	3-122
	OA22A/OA22D2A	3-125

Cell List

Cell Name	Function Description
AD2	2-Input AND
AD2D2	2-Input AND with 2X Drive
AD3	3-Input AND
AD3D3	3-Input AND with 3X Drive
AD4	4-Input AND
AD4D2	4-Input AND with 2X Drive
AD5	5-Input AND
AD5D2	5-Input AND with 2X Drive
ND2	2-Input NAND
ND2D2	2-Input NAND with 2X Drive
ND3	3-Input NAND
ND3D2	3-Input NAND with 2X Drive
ND4	4-Input NAND
ND4D2	4-Input NAND with 2X Drive
ND5	5-Input NAND
ND5D2	5-Input NAND with 2X Drive
ND6	6-Input NAND
ND6D2	6-Input NAND with 2X Drive
ND8	8-Input NAND
ND8D2	8-Input NAND with 2X Drive
NR2	2-Input NOR
NR2D2	2-Input NOR with 2X Drive
NR3	3-Input NOR
NR3D2	3-Input NOR with 2X Drive
NR4	4-Input NOR
NR4D2	4-Input NOR with 2X Drive
NR5	5-Input NOR
NR5D2	5-Input NOR with 2X Drive
NR6	6-Input NOR
NR6D2	6-Input NOR with 2X Drive
NR8	8-Input NOR
NR8D2	8-Input NOR with 2X Drive
OR2	2-Input OR
OR2D2	2-Input OR with 2X Drive

Cell List (Continued)

Cell Name	Function Description
OR3	3-Input OR
OR3D3	3-Input OR with 3X Drive
OR4	4-Input OR
OR4D2	4-Input OR with 2X Drive
OR5	5-Input OR
OR5D2	5-Input OR with 2X Drive
XN2	2-Input Exclusive-NOR
XN2D2	2-Input Exclusive-NOR with 2X Drive
XN3	3-Input Exclusive-NOR
XN3D3	3-Input Exclusive-NOR with 3X Drive
XO2	2-Input Exclusive-OR
XO2D2	2-Input Exclusive-OR with 2X Drive
XO3	3-Input Exclusive-OR
XO3D3	3-Input Exclusive-OR with 3X Drive
AO21	2-AND into 2-NOR
AO21D2	2-AND into 2-NOR with 2X Drive
AO211	2-AND into 3-NOR
AO211D2	2-AND into 3-NOR with 2X Drive
AO22	Two 2-ANDs into 2-NOR
AO22D2	Two 2-ANDs into 2-NOR with 2X Drive
AO22A	2-AND and 2-NOR into 2-NOR
AO22D2A	2-AND and 2-NOR into 2-NOR with 2X Drive
AO222	Three 2-ANDs into 3-NOR
AO222D2	Three 2-ANDs into 3-NOR with 2X Drive
AO222A	Inverting 2-of-3 Majority
AO222D2A	Inverting 2-of-3 Majority with 2X Drive
AO33	Two 3-ANDs into 2-NOR
AO33D2	Two 3-ANDs into 2-NOR with 2X Drive
AO333	Three 3-ANDs into 3-NOR
AO333D2	Three 3-ANDs into 3-NOR with 2X Drive
OA21	2-OR into 2-NAND
OA21D2	2-OR into 2-NAND with 2X Drive
OA211	2-OR into 3-NAND
OA211D2	2-OR into 3-NAND with 2X Drive

Cell List (Continued)

Cell Name	Function Description
OA22	Two 2-ORs into 2-NAND
OA22D2	Two 2-ORs into 2-NAND with 2X Drive
OA22A	2-OR and 2-NAND into 2-NAND
OA22D2A	2-OR and 2-NAND into 2-NAND with 2X Drive
OA2222	Four 2-ORs into 4-NAND
OA2222D2	Four 2-ORs into 4-NAND with 2X Drive
DL1D2	1ns Delay Cell with 2X Drive
DL1D4	1ns Delay Cell with 4X Drive
DL2D2	2ns Delay Cell with 2X Drive
DL2D4	2ns Delay Cell with 4X Drive
DL3D2	3ns Delay Cell with 2X Drive
DL3D4	3ns Delay Cell with 4X Drive
DL4D2	4ns Delay Cell with 2X Drive
DL4D4	4ns Delay Cell with 4X Drive
DL5D2	5ns Delay Cell with 2X Drive
DL5D4	5ns Delay Cell with 4X Drive
DL10D2	10ns Delay Cell with 2X Drive
DL10D4	10ns Delay Cell with 4X Drive
IV	Inverter
IVD2	Inverter with 2X Drive
IVD3	Inverter with 3X Drive
IVD4	Inverter with 4X Drive
IVD6	Inverter with 6X Drive
IVD8	Inverter with 8X Drive
IVA	Inverter with 2X P-Transistor, 1X N-Transistor
IVD2A	Inverter with 4X P-Transistor, 2X N-Transistor
IVD3A	Inverter with 6X P-Transistor, 3X N-Transistor
IVD4A	Inverter with 8X P-Transistor, 4X N-Transistor
IVCD11	1X Inverter into 1X Inverter
IVCD13	1X Inverter into 3X Inverter
IVCD22	2X Inverter into 2X Inverter
IVCD26	2X Inverter into 6X Inverter
IVCD44	4X Inverter into 4X Inverter
IVT	Inverting Tri-State Buffer with Enable High

Cell List (Continued)

Cell Name	Function Description
IVTD2	Inverting Tri-State Buffer with Enable High, 2X Drive
IVTD4	Inverting Tri-State Buffer with Enable High, 4X Drive
IVTD8	Inverting Tri-State Buffer with Enable High, 8X Drive
IVTN	Inverting Tri-State Buffer with Enable Low
IVTND2	Inverting Tri-State Buffer with Enable Low, 2X Drive
IVTND4	Inverting Tri-State Buffer with Enable Low, 4X Drive
IVTND8	Inverting Tri-State Buffer with Enable Low, 8X Drive
NID	Non-Inverting Buffer
NID2	Non-Inverting Buffer with 2X Drive
NID3	Non-Inverting Buffer with 3X Drive
NID4	Non-Inverting Buffer with 4X Drive
NID6	Non-Inverting Buffer with 6X Drive
NID8	Non-Inverting Buffer with 8X Drive
NIT	Non-Inverting Tri-State Buffer with Enable High
NITD2	Non-Inverting Tri-State Buffer with Enable High, 2X Drive
NITD4	Non-Inverting Tri-State Buffer with Enable High, 4X Drive
NITD8	Non-Inverting Tri-State Buffer with Enable High, 8X Drive
NITN	Non-Inverting Tri-State Buffer with Enable Low
NITND2	Non-Inverting Tri-State Buffer with Enable Low, 2X Drive
NITND4	Non-Inverting Tri-State Buffer with Enable Low, 4X Drive
NITND8	Non-Inverting Tri-State Buffer with Enable Low, 8X Drive

LD5D2	D Latch with Active Low, 2X Drive
LD5S	D Latch with Active Low, Scan
LD5SD2	D Latch with Active Low, Scan, 2X Drive
LD5X4	4-Bit D Latch with Active Low
LD5X4D2	4-Bit D Latch with Active Low, 2X Drive
LD6	D Latch with Active Low, Reset
LD6D2	D Latch with Active Low, Reset, 2X Drive
LD7	D Latch with Active Low, Set
LD7D2	D Latch with Active Low, Set, 2X Drive
LD8	D Latch with Active Low, Reset, Set
LD8D2	D Latch with Active Low, Reset, Set, 2X Drive

Cell List (Continued)

Cell Name	Function Description
LDS2	D Latch with Active High, Synchronous Clear
LDS6	D Latch with Active Low, Synchronous Clear
LS0	SR Latch
LS0D2	SR Latch with 2X Drive
LS1	SR Latch with Separate Inputs
LS2	SR Latch with Common Inputs

OVERVIEW

The fourth chapter describes various kinds of Input/Output cells (5V/3.3V, normal and interface operations) in KG80/KGM80 libraries.

The switching characteristics of each cell are attached to its basic cell information. The AC characteristics of bi-directional buffers are not included in this data sheet, however, they can be derived from different combinations of input and output buffers.

There are so many possible combinations of input/output cells, therefore, the naming conventions are adopted to help you memorize and use this cell library efficiently. You can refer to the naming conventions contained in “Summary Tables” section.

The “Summary Tables” section shows the list of 5V and 3.3V I/O cells separated by the category (input, output, bi-directional, etc.), and the more detailed description tables can be found on the leading part of each category.

SUMMARY TABLES

Input Buffers

Cell Type	Cell Name	KG80	KGM80	Page
CMOS Level	PIC/PICD/PICU	o	o	4-9
	PHIC/PHICD/PHICU	–	o	
	PLIC/PLICD/PLICU	o	–	
TTL Schmitt Trigger Level	PIL/PILD/PILU	o	–	4-13
	PHIL/PHILD/PHILU	–	o	
CMOS Schmitt Trigger Level	PIS/PISD/PISU	o	o	4-16
	PHIS/PHISD/PHISU	–	o	
	PLIS/PLISD/PLISU	o	–	
TTL Level	PIT/PITD/PITU	o	–	4-20
	PHIT/PHITD/PHITU	–	o	

<Naming Convention of Input Buffers>

P v l a b			
v		**a**	
None	Normal operation	C	CMOS level
H	5V interface in KGM80	L	TTL Schmitt trigger level
L	3.3V interface in KG80	S	CMOS Schmitt trigger level
b		T	TTL level
None	No resistor		
D	Pull-down resistor		
U	Pull-up resistor		

Output Buffers

Cell Type	Cell Name	Current Drive (mA)		Page

NOTES:

1. KG80 standard open-drain output buffers, POD(1/2/4/8/12/16/20/24), cannot tolerate external pull-ups to more than 5.5V. And KGM80 standard open-drain output buffers, POD(1/2/4/6/8/10/12/16), cannot tolerate external pull-ups to more than 3.6V.
2. Fail-safe open-drain output buffers with external pull-ups to more than 5.5 V (in case of KG80) / 3.6V (in case of KGM80) can drive signals to that voltage range. However, if you want to use fail-safe open-drains, please contact to SEC ASIC first.

Overview

PCI buffers are designed for PCI local bus application which is an industry-standard, high-performance 32- or 64-bit bus architecture.

SEC ASIC supports 5V and 3.3V signalling environment PCI bi-directional buffers including a Universal buffer. The Universal buffer requires a select control (EN3V) signal. EN3V pin should be tied to the Voltage Detector output directly.

Features

– High performance
– Low cost
– Easy use
– Longevity: both 5V and 3.3V signalling environments specified.

General Description

The PCI buffer's signalling environment is controlled by EN3V pin which is logically low in a 5V operation and logically high in a 3.3V operation. If you use a Voltage Detector cell with the PCI buffer, you have to connect this EN3V pin to VDET (Voltage Detector) output. Do not use a Level Shifter buffer (PLSCB).

Cell List

Cell Name	Function Description
KG80	
PSIPCIA	5V PCI Input Buffer
PSOPCIA	5V PCI Output Buffer
PLSIPCIA	Internal 5V/External 3.3V PCI Input Buffer
PLSOPCIA	Internal 5V/External 3.3V PCI Output Buffer
PSIPCIAU	Universal PCI Input Buffer
PSOPCIAU	Universal PCI Output Buffer
KGM80	
PSIPCIA3	3.3V PCI Input Buffer
PSOPCIA3	3.3V PCI Output Buffer
PHSIPCIA	Internal 3.3V/External 5V PCI Input Buffer
PHSOPCIA	Internal 3.3V/External 5V PCI Output Buffer
PSIPCIAU	Universal PCI Input Buffer
PSOPCIAU	Universal PCI Output Buffer

Electrical Characteristics

SEC ASIC guarantees PCI buffer's electrical characteristics under all conditions (V_{CC} = 3.6V, Temp. = 0°C ~ V_{CC} = 3.0V, Temp. = 125°C).

5V DC Specifications

Symbol	Parameter	Condition	Min	Max	Unit
V_{CC}	Supply Voltage		4.75	5.25	V
V_{IL}	Input Low Voltage		–0.5	0.8	
V_{IH}	Input High Voltage		2.0	V_{CC} + 0.5	
I_{IL}	Input Low Leakage Current	V_{IN} = 0.5		–70	µA
I_{IH}	Input High Leakage Current	V_{IN} = 2.7		70	
V_{OL}	Output Low Voltage	I_{OUT} = 3mA, 6mA		0.55	V
V_{OH}	Output High Voltage	I_{OUT} = –2mA	2.4		
C_{IN}	Input Pin Capacitance			10	pF
C_{CLK}	CLK Pin Capacitance		5	12	
C_{IDSEL}	IDSEL Pin Capacitance			8	
L_{PIN}	Pin Inductance			20	nH

5V AC Specifications

Symbol	Parameter	Condition	Min	Max	Unit
$I_{OH\ (AC)}$	Switching Current High	$0 < V_{OUT} \leq 1.4$	–44		mA
		$1.4 < V_{OUT} < 2.4$	–44 (VOUT – 1.4) / 0.024		
		$3.1 < V_{OUT} < V_{CC}$		Eqt'n A[1]	
	(Test Point)	V_{OUT} = 3.1		–142	
$I_{OL\ (AC)}$	Switching Current Low	$V_{OUT} \geq 2.2$	95		
		$2.2 > V_{OUT} > 0.55$	V_{OUT}/0.023		
		$0.71 > V_{OUT} > 0$		Eqt'n B[2]	
	(Test Point)	V_{OUT} = 0.71		206	
I_{CL}	Low Clamp Current	$–5 < V_{IN} \leq –1$	$–25 + (V_{IN} + 1) / 0.015$		
$Slew_R$[3]	Output Rise Slew Rate	0.4V to 2.4V load	1	5	V/ns
$Slew_F$[3]	Output Fall Slew Rate	2.4V to 0.4V load	1	5	

NOTES:

1. **Equation A**: $I_{OH} = 11.9 * (V_{OUT} – 5.25) * (V_{OUT} + 2.45)$ for $V_{CC} > V_{OUT} > 3.1v$
2. **Equation B**: $I_{OL} = 78.5 * V_{OUT} * (4.4 – V_{OUT})$ for $0v < V_{OUT} < 0.71v$
3. The minimum slew rate (slowest signal edge) is guaranteed. The maximum slew rate (fastest signal edge) is a guideline, and rise and fall times faster than the maximum can occur.
   Designers should ensure that signal integrity modelling includes the potential for rise and fall times faster than the maximum shown in the table.

3.3V DC Characteristics

Symbol	Parameter	Condition	Min	Max	Unit
V_{CC}	Supply Voltage		3.0	3.6	V
V_{IL}	Input Low Voltage		–0.5	$0.3V_{CC}$	V
V_{IH}	Input High Voltage		$0.5V_{CC}$	V_{CC} + 0.5	V
V_{IPU}	Input Pull-Up Voltage		$0.7V_{CC}$		V
I_{IL}	Input Leakage Current	$0 < V_{IN} < V_{CC}$		±10	µA
V_{OL}	Output Low Voltage	I_{OUT} = 1500µA		$0.1V_{CC}$	V
V_{OH}	Output High Voltage	I_{OUT} = –500µA	$0.9V_{CC}$		V
C_{IN}	Input Pin Capacitance			10	pF
C_{CLK}	CLK Pin Capacitance		5	12	pF
C_{IDSEL}	IDSEL Pin Capacitance			8	pF
L_{PIN}	Pin Inductance			20	nH

3.3V AC Characteristics

Symbol	Parameter	Condition	Min	Max	Unit
$I_{OH (AC)}$	Switching Current High	$0 < V_{OUT} \leq 0.3V_{CC}$	$-12V_{CC}$		mA
		$0.3V_{CC} < V_{OUT} < 0.9V_{CC}$	$-17.1 (V_{CC} - V_{OUT})$		mA
		$0.7V_{CC} < V_{OUT} < V_{CC}$		Eqt'n C[1]	
	(Test Point)	$V_{OUT} = 0.7V_{CC}$		$-32V_{CC}$	mA
$I_{OL (AC)}$	Switching Current Low	$V_{CC} > V_{OUT} \geq 0.6V_{CC}$	$16V_{CC}$		mA
		$0.6V_{CC} > V_{OUT} > 0.1V_{CC}$	$26.7V_{OUT}$		mA
		$0.18V_{CC} > V_{OUT} > 0$		Eqt'n D[2]	
	(Test Point)	$V_{OUT} = 0.18V_{CC}$		$38V_{CC}$	mA
I_{CL}	Low Clamp Current	$-3 < V_{IN} \leq -1$	$-25 + (V_{IN} + 1) / 0.015$		mA
I_{CH}	High Clamp Current	$V_{CC} + 4 > V_{IN} \geq V_{CC} + 1$	$25 + (V_{IN} - V_{CC} - 1) / 0.015$		mA
$Slew_R$[3]	Output Rise Slew Rate	$0.2V_{CC}$ to $0.6V_{CC}$ load	1	4	V/ns
$Slew_F$[3]	Output Fall Slew Rate	$0.6V_{CC}$ to $0.2V_{CC}$ load	1	4	V/ns

NOTES:

1. **Equation C**: $I_{OH} = (98.0 / V_{CC}) * (V_{OUT} - V_{CC}) * (V_{OUT} + 0.4V_{CC})$ for $V_{CC} > V_{OUT} > 0.7v$
2. **Equation D**: $I_{OL} = (256 / V_{CC}) * V_{OUT} * (V_{CC} - V_{OUT})$ for $0v < V_{OUT} < 0.18V_{CC}$
3. The minimum slew rate (slowest signal edge) is guaranteed. The maximum slew rate (fastest signal edge) is a guideline, and rise and fall times faster than the maximum can occur.
   Designers should ensure that signal integrity modelling includes the potential for rise and fall times faster than the maximum shown in the table.

PCMCIA BUFFERS

Overview

PC card technology is used in a wide variety of products including notebook computers, palmtop computers, pen computers, desktop computers, printers, telephones, medical instruments and others embedded application hosts.

For PCMCIA interface, SEC ASIC supports various kinds of PCMCIA buffers.
These PCMCIA buffers enable you to

– Maintain interface conditions and speed independent of Battery Voltage
– Allow groups of card interface input buffers to be powered down
– Use a Voltage Detector cell
– Select pull-up/pull-down option (50K/100K/200K, default = 100K).

General Description

All of PCMCIA buffers are controlled by S3V5V signal that is logically low in a 5V operation and logically high in a 3.3V operation. If you use a Voltage Detector cell with a PCMCIA buffer, you have to connect the S3V5V pin to VDET (Voltage Detector) output.

Logic Levels

Parameter	Min	Max
V_{IH}	2.0V	
V_{IL}		0.8V
V_{OH}	2.4V	
V_{OL}		0.5V

NOTES:

1. PCMCIA input buffer is TTL compatible.
2. PCMCIA output buffer has a balanced T_R & T_F.

Overview

CardBus I/O buffers have 3.3V operation, 32-bit bus width and 33MHz of transmission speed. The latest version of the PC card standard adds information to improve compatibility with the standard by requiring a Card Information Structure (CIS) on every PC card.

The standard has also been enhanced to support the following optional features:

– Low-Voltage Only Operation (3.3V)
– Hardware Direct Memory Access (DMA)
– Multiple-Function Cards
– Industry Standard Power Management Interface (APM)
– High Throughput 32-Bit Bus Mastering Interface (CardBus)

SEC ASIC supports nine different CardBus I/O buffers. If necessary, a Voltage Detector cell can be used with them. For maximum flexibility, CardBus I/O buffers have not only a Level Shifter but also a pull-up enable control pin.

CardBus I/O buffers have only 3.3V electrical specifications, however, we can support 5V/3.3V flexible operation by using of a level shifter. Regardless of the I/O voltage, S3V5V pin controls the same input level and output driving current. S3V5V pin should be tied to the voltage detector in a mixed system, or ground in a 3.3V-only system.

We can not attribute a level shifter to PUEN (Pull-Up Enable) pin, because we have only four level shifters. In order to control the PUEN pin with an internal signal, you should use the level shifter butter (PLSCB) in a mixed system.

For minimizing power consumption, CardBus I/O buffers have a nand type input with a control pin. Therefore, the input buffers operate as active-high input buffers. However, if the control pin is in low state, the output Y is low and not tri-state.

General Description

The CardBus I/O buffer is controlled by S3V5V signal that is logically low in a 5V operation and logically high in a 3.3V operation. If you use a voltage detector cell with the CardBus I/O buffer, you have to connect this S3V5V pin to VDET (voltage detector) output. Do not use a level shifter buffer (PLSCB).

CSTSCHG Buffer Specification

The CSTSCHG pin can be used by the CardBus PC card to remotely power up the system. The design of the CardBus PC card's output buffer and the system's input buffer must ensure no electrical damage results.

– An output buffer for CSTSCHG pin never exceed 1mA.
– An input buffer for CSTSCHG pin is able to withstand sustained forward bias current of 1mA.

CCLK Specification

The electrical characteristics of CCLK follows 3.3V signalling of PCI Local bus specification Revision 2.1. Refer to the PCI buffer electrical characteristics.

Electrical Characteristics (Normal CardBus interface type buffers)

3.3V DC Specifications

Symbol	Parameter	Condition	Min	Max	Unit
V_{CC}	Supply Voltage		3.0	3.6	V
V_{IH}	Input High Voltage		$0.475V_{CC}$	V_{CC} + 0.5	
V_{IL}	Input Low Voltage		–0.5	$0.325V_{CC}$	
V_{OH}	Output High Voltage	I_{OUT} = –150µA	$0.9V_{CC}$		
V_{OL}	Output Low Voltage	I_{OUT} = 700µA		$0.1V_{CC}$	
I_{CC}[1]	Supply Current			1	A
I_{IL}[2]	Input Leakage Current	$0 < V_{IN} < V_{CC}$		±10	µA

NOTES:

1. This is determined solely by the maximum current capacity of the V_{CC} pins on the connector.
2. Input leakage currents include High-Z output leakage for all bi-directional buffers with High-Z outputs. CCD1#, CCD2#, CVS1 and CVS2 do not have to meet leakage requirements.

3.3V AC Specifications

Symbol	Parameter	Condition	Min	Max	Unit
t_{RCB}[1]	Output Rise Time	$0.2V_{CC} – 0.6V_{CC}$	0.25	1.0	V/ns
t_{FCB}[1]	Output Fall Time	$0.6V_{CC} – 0.2V_{CC}$	0.25	1.0	
I_{CL}	Low Clamp Current	$–3 < V_{IN} < –1$	$–25 + (V_{IN} + 1) / 0.015$		mA
I_{CH}	High Clamp Current	$V_{CC} + 4 > V_{IN} > V_{CC} + 1$	$25 + (V_{IN} – V_{CC} – 1) / 0.015$		

NOTE:

1. This does not apply to **CCLK**. Minimum and maximum rates are measured with the minimum capacitive load a driver will see (7pF). The values ensure the fastest edge rate will not switch rail-to-rail faster than 3.6ns.

OVERVIEW

This chapter contains information for KG80/KGM80 memory compilers such as ROM, single-port RAM, dual-port RAMs, RAM-based FIFO and multiplier generators.

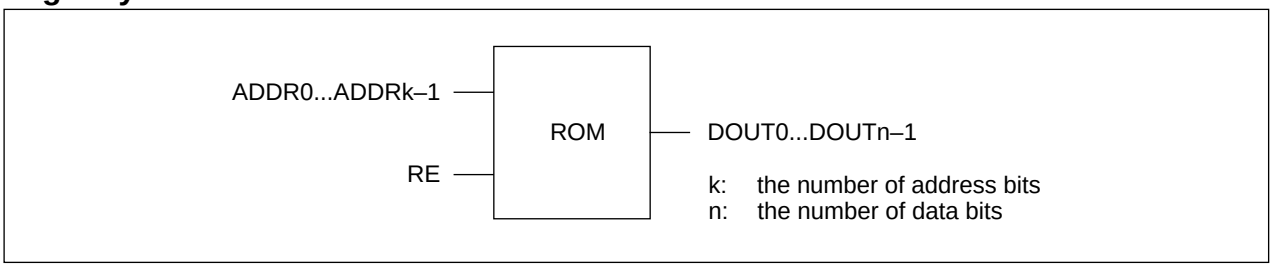
Cell Names & Function Descriptions

Cell Name	Function Description
ROM	Asynchronous/Synchronous ROM Generator
RAM	Asynchronous Single-Port RAM Generator
1R1W DPRAM	Asynchronous One Read One Write Dual-Port RAM Generator
1RW1R DPRAM	Asynchronous One Read/Write One Read Dual-Port RAM Generator
FIFO	Ram-Based First-In First-Out Memory Generator
Multiplier	Multiplier Generator

ROM

Asynchronous/Synchronous ROM Generator

Logic Symbol



NOTE: In KG80 “RE” pin should be tied to VDD.

Description

This is a high-speed, low-power ROM with fully static and asynchronous operation, and one read address port and one data output port. The number of words and word width can be configured with the MEMGEN memory compiler. ROM code is contact layer programmable.

Four ROM architectures (Type 1, 2, 3 and 4) support variable cell aspect ratios consistent with word/bit configuration limitations.

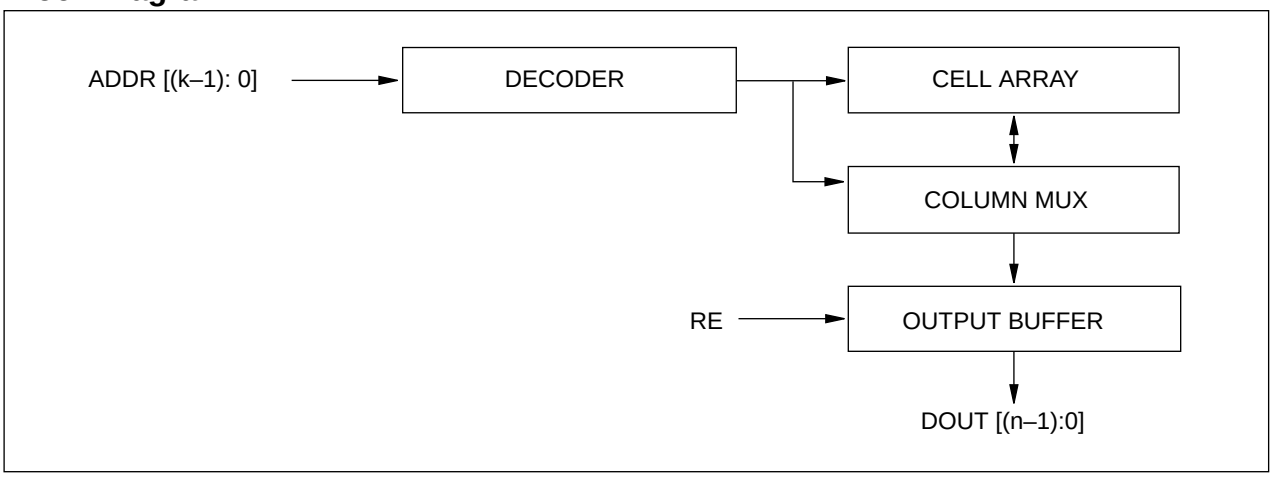
Features

- Zero standby power
- High speed
- Contact programmable ROM code
- Asynchronous and fully static operation
- Parameter-driven compiler
- Up to 36K bit block
- Variable word depth
  – 8, 16, 24, 32, 40,..., 256
- Variable word width
  – 4, 5, 6, 7, 8,..., 144
- Available architectures
  – Type1, Type 2, Type 3 and Type 4

I/O Pin Description

Name	I/O	I/O Cap. [pF]	Description
ADDR0...ADDRk–1	I	0.042	Read Address
RE	I	0.021	Read Enable
DOUT0...DOUTn–1	O	0.041	Data Output

Block Diagram



Gate Count

Gate Count = Height x Width
Size = (Height x 19.0) x (Width x 6.0)

Height Calculation

Height = (Words / (4 x Type)) + A
if (Type = 1), then A = 7
else A = 5

Width Calculation

Width = Type x Bits x 2 + 1 + Div (Type x Bits / 25) + B
A = Words / (2 x Type)

Type / A	1		2		3		4	
	Width<36	Width>=36	Width<18	Width>=18	Width<12	Width>=12	Width<9	Width>=9
4	B = 5	B = 7	B = 7	B = 7	B = 9	B = 11	B = 10	B = 11
8	B = 6	B = 8	B = 7	B = 8	B = 9	B = 11	B = 10	B = 11
12	B = 8	B = 10	B = 8	B = 10	B = 9	B = 11	B = 10	B = 11
16	B = 8	B = 10	B = 8	B = 10	B = 9	B = 11	B = 10	B = 11
20 ~ 32	B = 10	B = 12	B = 10	B = 12	B = 10	B = 12	B = 10	B = 12
36 ~ 128	B = 11	B = 13	B = 11	B = 13	B = 11	B = 13	B = 11	B = 11

< Example: ROM32 x 19 (Type = 2) >

Height = {32 / (4 x 2)} + 5 = 9
Width = 2 x 19 x 2 + 1 + 1 + 8 = 86
Gate Count = (9 x 86) arrays
Size = (9 x 19.0) x (86 x 6.0) microns

The table below shows the number of gates used for representative ROMs. Although architecture type also affects the number of gates, this table shows the number of gates for type 2.

Gate Counts for Representative ROMs

Asynchronous/Synchronous ROM Generator

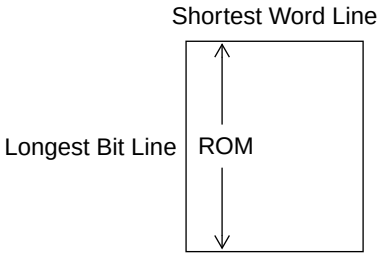
Architecture

Type 1



For Type 1, the specified number of words will equal the number of rows and the specified number of bits will equal the number of columns in the ROM array.

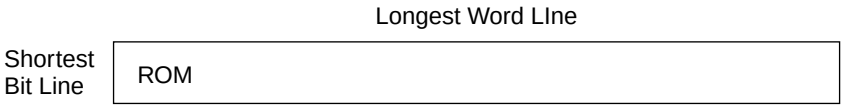
Type 2

For the same size ROM, Type 2 will have one-half the specified number of rows and twice the specified number of columns.

Type 3

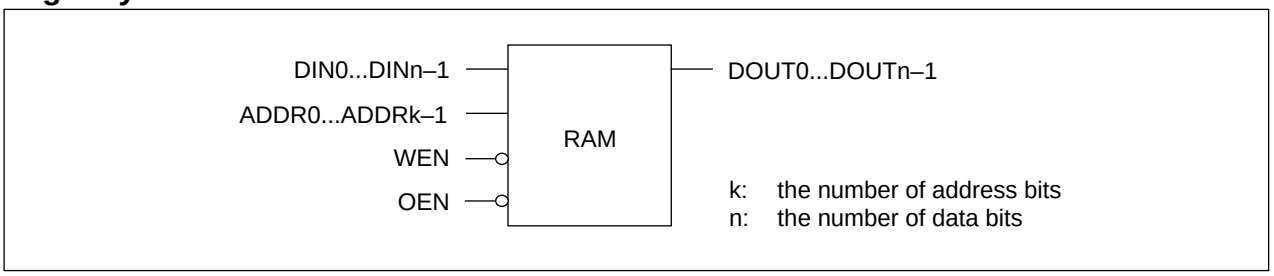
For the same size ROM, Type 3 will have one-third the specified number of rows and three times the specified number of columns.

Type 4



For the same size ROM, Type 4 will have one-fourth the specified number of rows and four times the specified number of columns.

Logic Symbol



Description

This is a high-speed, low-power, single-port RAM with fully static and asynchronous operation. The number of words and word width can be configured with the MEMGEN memory compiler. The design has one read/write address port, one data input port, and one data output port. Control pins are OEN (output enable) and WEN (write enable). During write operation, the data output port reflects data at the input port if the output tri-state buffers are enabled.

Four RAM architectures (Type 1, 2, 3 and 4) support varying aspect ratios consistent with word/bit configuration limitations.

Features

- 1 read/write address port
- 1 data input and 1 data output port
- Zero standby power
- High speed
- Asynchronous and fully static operation
- Tri-state output buffers
- Parameter-driven compiler
- Up to 9K bit block
- Variable word depth
  – 8, 16, 24, 32, 40,..., 256
- Variable word width
  – 4, 5, 6, 7, 8,..., 72
- Available architectures
  – Type1, Type 2, Type 3 and Type 4

I/O Pin Description

Name	I/O	I/O Cap. [pF]	Description
DIN0...DINn–1	I	0.021	Data Input
ADDR0...ADDRk–1	I	0.042	Read/Write Address
WEN	I	0.042	Write Enable Memory write operation is enabled when WEN is low.
OEN	I	0.021	Output Enable When OEN is high, the outputs are in high impedance state. When OEN is low, the data outputs are enabled.
DOUT0...DOUTn–1	O	0.042	Data Output

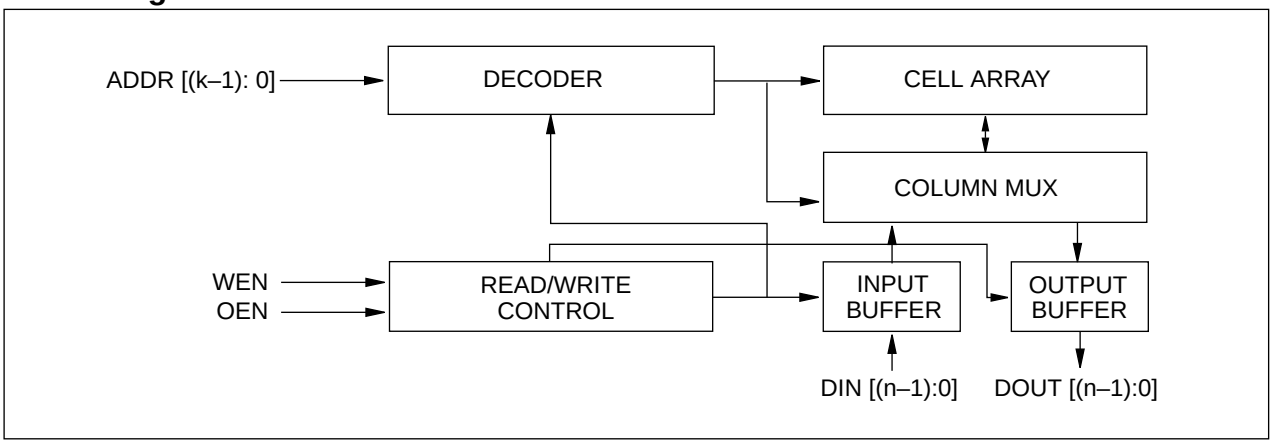
Truth Table

WEN	OEN	Mode
L	X	Write
X	L	Read
X	H	Output = High Impedance

RAM

Asynchronous Single-Port RAM Generator

Block Diagram



Gate Count

Gate Count = Height x Width
Size = (Height x 19.0) x (Width x 6.0)

Height Calculation

Height = (Bits x Type) + A
if (Words / Type = 8), then A = 5
else if {(Words / Type > 8) and (Words / Type < 72), then A = 6
else if (Words / Type >= 72), then A = 7

Width Calculation

Width = 3 x (Words / Type) + 2 + B
if (Type = 1), then B = 9
else if (Type = 2), then B = 17
else if (Type = 3), then B = 15
else if (Type = 4), then B = 14

< Example: RAM176 x 16 (Type = 2) >

Height = (16 x 2) +7 = 39
Width = 3 x (176 / 2) + 2 + 17 = 283
Gate Count = (39 x 283) arrays
Size = (39 x 19.0) x (283 x 6.0) microns

The table below shows the number of gates used for representative RAMs. Although architecture type also affects the number of gates, this table shows the number of gates for type 2.

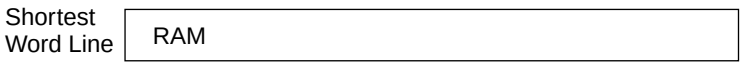
Asynchronous Single-Port RAM Generator

Architecture

Type 1

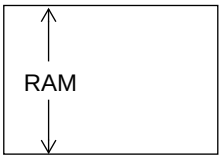


For Type 1, the specified number of words will equal the number of columns and the specified number of bits will equal the number of rows in the RAM array.

Type 2

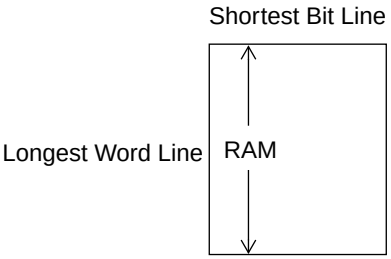
For the same size RAM, Type 2 will have twice the specified number of columns and one-half the specified number of rows.

Type 3



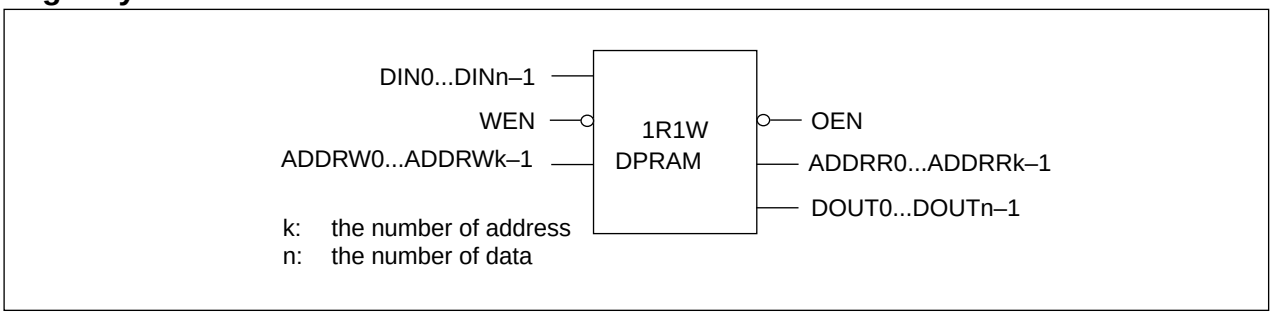
For the same size RAM, Type 3 will have three times the specified number of columns and one-third the specified number of rows.

Type 4



For the same size RAM, Type 4 will have four times the specified number of columns and one-fourth the specified number of rows.

Logic Symbol



Description

This high-speed, low-power, 1R1W dual-port RAM has fully static and asynchronous operation. The number of words and word width can be configured with the MEMGEN—embedded memory compiler. The design has one read address port and one write address port, and one data input port and one data output port. Control pins are OEN (output enable) and WEN (write enable). During a write operation, the data output ports reflect the data which are stored in the read address, if the output tri-state buffers are enabled.

Four RAM architectures (Type 1, 2, 4 and 8) support varying aspect ratios consistent with word/bit configuration limitations.

Features

- Fully asynchronous read/write operation
- Variable size dual-port RAM with
  1 read and 1 write address port,
  1 data input and 1 data output port
- Zero stand-by power
- High speed
- Tri-state output buffers
- Parameter-driven compiler
- Up to 9K bit block
- Variable word depth
  – 8, 16, 24, 32, 40,..., 1024
- Variable word width
  – 4, 5, 6, 7, 8,..., 72
- Available architectures
  – Type1, Type 2, Type 4 and Type 8

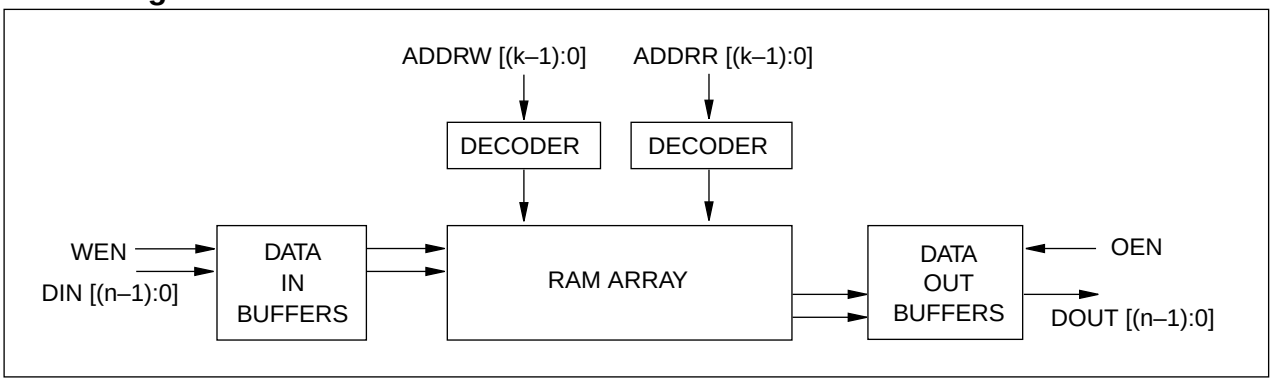
1R1W DPRAM

Asynchronous One Read One Write Dual-Port RAM Generator

Block Diagram



Gate Count

Gate Count = Height x Width
Size = (Height x 19.0) x (Width x 6.0)

Height Calculation

Height = (Bits x Type) + 2 x A + B
A = DIV (Type / 2)
if (Words / Type = 8), then B = 8
else if {(Words / Type > 8) and (Words / Type < 40), then B = 9
else if {(Words / Type > 32) and (Words / Type < 72), then B = 10
else if (Words / Type >= 72), then B = 12

Width Calculation

Width = 3 x (Words / Type) + 15 + A
if (Type = 1), then A = 0
else if MOD (Bits / 3) = 0, then A = DIV (Bits / 3) x 2
else if MOD (Bits / 3) = 1, then A = DIV (Bits / 3) x 2 + 1
else if MOD (Bits / 3) = 2, then A = DIV (Bits / 3) x 2 + 2

< Example: 1R1W DPRAM 256 x 16 (Type = 2) >

Height = (16 x 2) + 2 x 1 + 12 = 46
Width = 3 x (256 / 2) + 14 + 12 = 410
Gate Count = (46 x 410) arrays
Size = (46 x 19.0) x (410 x 6.0) microns

The table below shows the number of gates used for representative 1r1w DPRAMs. Although architecture type also affects the number of gates, this table shows the number of gates for type 2.

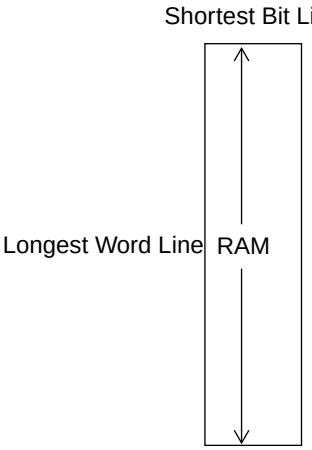
For the same size RAM, Type 4 will have four times the specified number of columns and one-fourth the specified number of rows.

Type 8



For the same size RAM, Type 8 will have eight times the specified number of columns and one-eighth the specified number of rows.

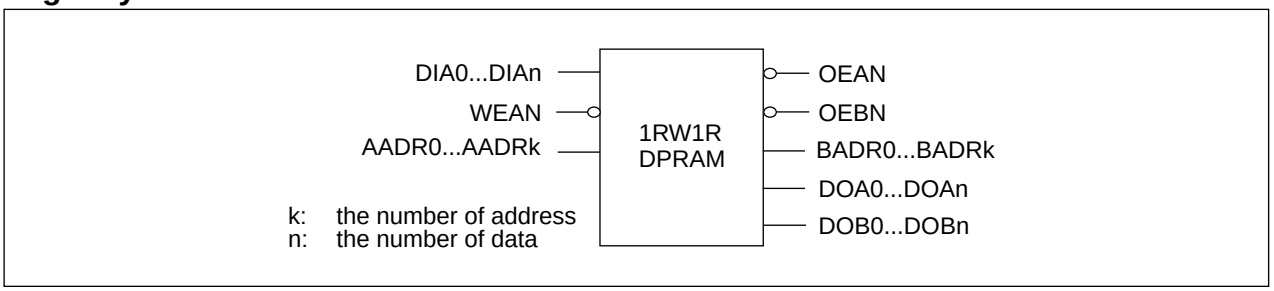
Logic Symbol



Description

FIFO builder generates a compiled first-in first-out memory block. FIFO is based on a dual-port RAM that permits completely asynchronous read/write operation. Read and write address values are stored in counters that can be cleared with the RN (reset) input. FIFO builder also has status flags for empty and full.

Features

- Fully asynchronous read/write operation
- 1 data input and 1 data output port
- Zero standby power
- High speed
- Parameter-driven compiler
- Variable word depth
  – 8, 10, 12, 14, 16,..., 1024
- Variable word width
  – 4, 5, 6, 7, 8,..., 72

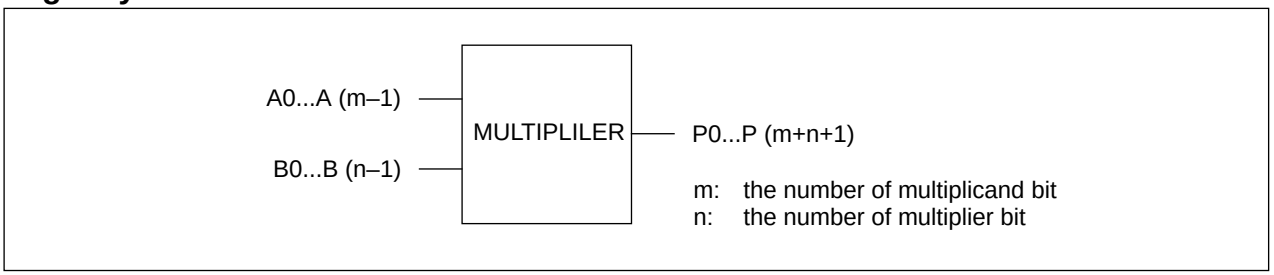
Logic Symbol



Description

The function is P = A * B (A = multiplicand, B = multiplier and P = product of (A * B)). A, B and P are two's compliment formats.

The width of A input = m bit, range from [2 ** (m – 1) – 1] to [–2 ** (m – 1)] and the width of B input = n bit, range from [2 ** (n – 1) – 1] to [–2 ** (n – 1)].
The smaller bit width between A and B will be the multiplier and of even bits. That is, the multiplier might be the sum of smaller bit width and one.
The width of P output = (m + n) bit, assume that multiplicand is m bits and multiplier is n bits. m ≥ n, range from [2 ^ (m + n – 2)] to [2 ^ (n – 1) –2 ^ (m + n – 2)], 4 ≤ m and n ≤ 32.
You can choose a cell compiled with your bit request. This is the softmacro cell.

Features

- Variable size multiplier and multiplicand bits
- Zero standby power
- High speed
- Parameter-driven compiler
- 32 bits of multiplier and multiplicand
- Variable bit size
  – Multiplicand size: 4–32 bits
  – Multiplier size: 4–32 bits

Configurations

- A: 4,..., 32
- B: 4,..., 32

Standard design kit supports the following configurations: 8×8, 12×12, 16×16, 24×24, 32×32.
Other configurations can be provided upon request.

OVERVIEW

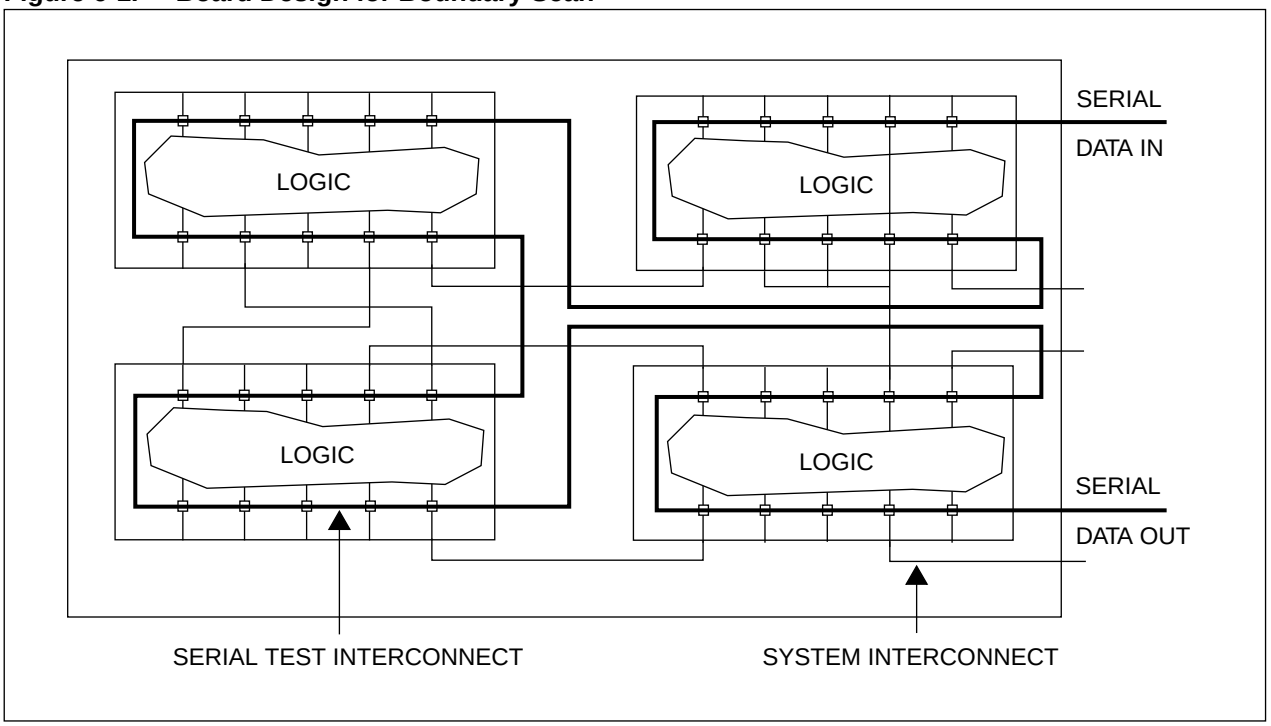
A board test is typically achieved by using in-circuit test techniques. However, in-circuit test techniques demonstrate significant limitations for Surface Mount Technology (SMT) and Fine Pitch Technology (FPT) boards. The pin and pad spacings getting tighter make it difficult to test boards with traditional methods economically and reliably.

A boundary scan design reduces the cost of a function test. A boundary scan design circuitry allows boards to be tested using the equivalent in-circuit test technique without bed-of-nails fixture. In recognition of the increasing acceptance of the boundary scan test, IEEE and JTAG (Joint Test Action Group) developed IEEE Standard Test Access Port and Boundary Scan Architecture (IEEE Std 1149.1).

A boundary scan technique requires to place a boundary scan cell adjacent to each component pin so that signals at component boundaries can be controlled and observed using scan testing principles. Each boundary scan cell for a given component is able to capture data from an input pin or from its internal logic, and to drive its internal logic or an output pin. Boundary scan cells for the pins of a given component are interconnected so as to form a shift-register chain around the border of the design, known as a boundary scan register. Boundary scan registers for individual components can be connected in series to form a single path through the complete design as shown in the figure 9-1. Alternatively, a board design can contain several independent boundary scan paths that allow individual components to be tested as well as the interconnections between components.

To test component interconnections, test data are first shifted into all boundary scan register cells associated with component output test pins. Test data are then loaded into parallel inputs of boundary scan cells associated with input pins through the component interconnections, and data captured in these cells are shifted out from the boundary cells for evaluation. For an individual component test, a boundary scan register is used to isolate on-chip system logic from stimuli received from surrounding components. An actual test can be performed through the boundary scan path or the built-in self-test hardware.

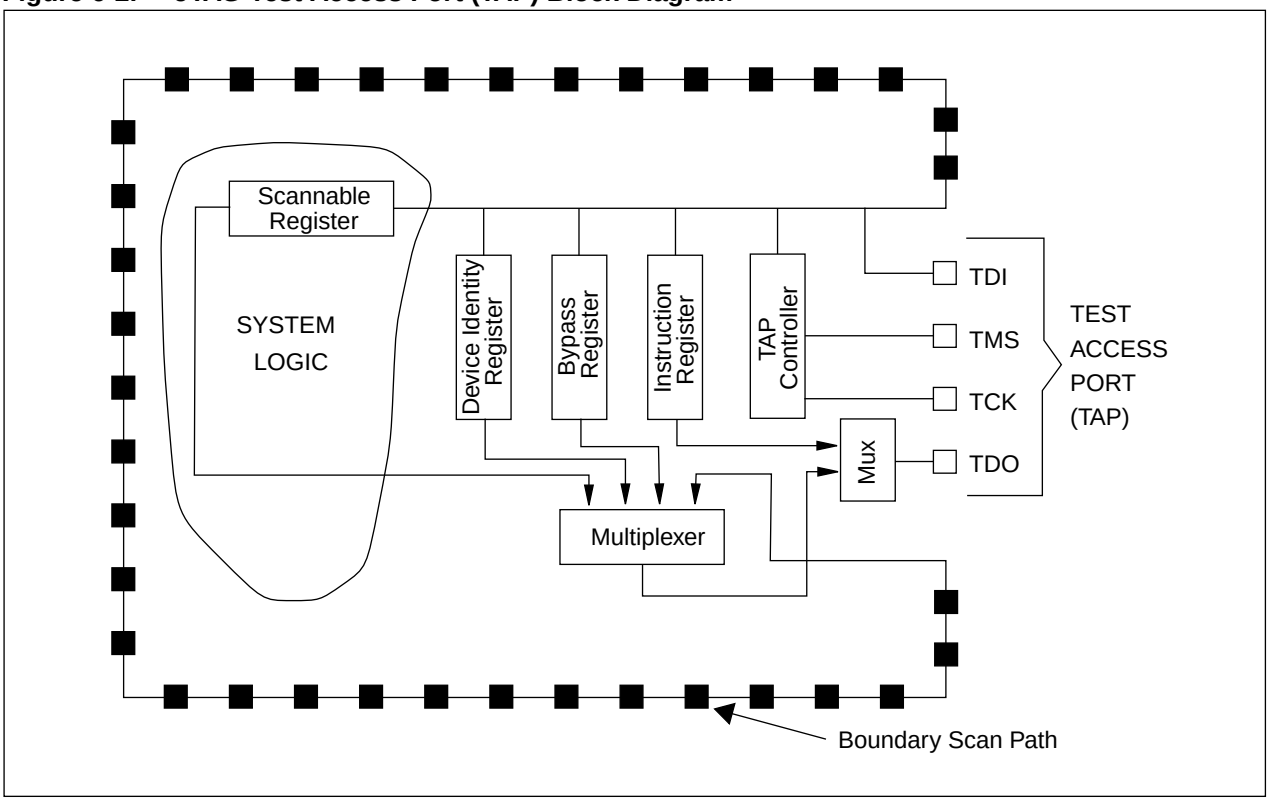
Figure 6-1. Board Design for Boundary Scan



BOUNDARY SCAN ARCHITECTURE

A boundary scan architecture contains TAP (Test Access Port), TAP controller, instruction register and a group of test data registers. The instruction and test data registers are separate shift-register-based paths connected in parallel with a common serial data input and a common serial data output which are connected to TAP, TDI and TDO signals. TAP controller selects the alternative instruction and test data register paths between TDI and TDO. The schematic view of the top level design of the test logic architecture is shown in the figure 9-2.

Figure 6-2. JTAG Test Access Port (TAP) Block Diagram



Boundary Scan Functional Block Descriptions

TAP (Test Access Port)

TAP is a general-purpose port that can provide with an access to many test support functions built into a component, including the test logic. It includes three inputs (TCK; Test Clock Signal, TMS; Test Mode Signal and TDI; Test Data Input) and one output (TDO; Test Data Output) required by the test logic. An optional fourth input (TRSTN; Test Reset) is provided for the asynchronous initialization of the test logic. The values applied at TMS and TDI pins are sampled on the rising edge of TCK, and the value placed on TDO pin changes on the falling edge of TCK.

TAP Controller

TAP controller receives TCK, interprets the signals on TMS, and generates clock and control signals for both instruction and test data registers and for other parts of the test circuitries as required.

Instruction Register/Instruction Decoder

Test instructions are shifted into and held by the instruction register. Test instructions include a selection of tests to be performed or the test data register to be accessed. A basic 3-bit instruction register and its instruction decoder are provided as macrofunctions in the library.

Test Data Registers

Data registers include a bypass register, a boundary scan register, a device identification register and other design specific registers. Only the bypass- and boundary scan registers are mandatory; the rest are optional.

Bypass register:	The bypass register provides a single-bit serial connection through the circuit when none of the other test data registers is selected. It can be used to allow test data to flow through a given device to the other components in a product without affecting a normal operation.
Boundary scan register:	The boundary scan register detects typical production defects in board interconnects, such as opens, shorts, etc. It also allows an access to component inputs and outputs when you test their logic or sample flow-through signals. Special boundary scan register macrocells are provided for this purpose. These special registers is discussed in the next section of next pages.
Design-specific test data register:	These optional registers may be provided to allow an access to design-specific test support features in the integrated circuit, such as self-test, scan test.
Device identification register:	This is an optional test data register that allows the manufacturer part number and variant of a components to be identified. The 32-bit identification register is partitioned into four fields:

Device version identifier	1st field	The first four bits beginning from MSB
Device part number	2nd field	16 bits
Manufacturer's JEDEC number	3rd field	11 bits
LSB	4th field	1 bit —tied in High

The ASIC designer is free to fill the version and part number in any manner as long as the total twenty bits are used.

SEC's JEDEC code:	78 decimal = 1001110 Continuation field (4 bits) = 0000
Contents of device identification register:	XXXX XXXXXXXXXXXXXXX 0000 1001110 1 Users can define these two fields.

BOUNDARY SCAN REGISTER MACROCELLS

The boundary scan register allows testing of circuitry external to the integrated circuit and provides for defined conditions to be established at the periphery of the on-chip system logic while it is tested itself. It also permits signals flowing through system pins to be sampled and examined without interfering with the operation of the on-chip system logic. The boundary scan register has four capabilities:

Capture: Loads data into the boundary scan register in parallel on the rising edge of TCK. It does not affect the output until Update is executed.

Shift: Shifts data from one boundary scan register to the next register towards the serial data output pin on the rising edge of TCK.

Update: Loads data in the boundary scan register into the parallel data output pin on the falling edge of TCK when EXTEST or INTEST instruction is selected.

Set: Sets the parallel output pin.

SEC supports five types of boundary scan registers. Four of them, JTCK, JTBI1, JTIN1 and JTOUT1 are to be implemented around the periphery of the die next to I/O cells. For this reason, two I/O pads at each corner, that is, the total of eight I/O pads for the entire chip are not scannable. An implementation is automatically performed during a placement to achieve the most optimum placement with a minimum performance penalty. The fifth cell, JTINT1, is to be placed in the core area of the die for tri-state I/O control. Applications for each type of boundary scan register cell are summarized as follows.

Cell List

Cell Name	Function Description	Page
JTBI1	Bi-directional I/O Boundary Scan Cell	6-5
JTCK	Special Input (such as Clock Input) Boundary Scan Cell	6-12
JTIN1	Input Boundary Scan Cell	6-14
JTINT1	Tri-State I/O Control Boundary Scan Cell	6-18
JTOUT1	Output Boundary Scan Cell	6-24

X	X	X	X	1	X	X	LatchQo

NOTES:

1. Outputs are defined in separate truth tables. In addition, the internal states known as “LatchQ” and “LatchQN” are defined as the output of the latch in the logic diagram.
2. JTBI1 has a similar truth table to JTIN1 and JTOUT1 macrocells without SETN input. It has similar delays to JTIN1 and JTOUT1.

General Description

JTCK is a special input boundary scan cell for clock pad. It has capture and shift capabilities only. JTCK doesn't have update and set capabilities, but has clock enable capability.

Pin Description

Pin name	I/O	Description
DINP	I	Parallel System Data Input
TDI	I	Serial Test Data Input
SHIFT	I	Active High Shift Control Input
TCK	I	Test Clock Input
ENB	I	Active High Test Clock Enable Input
TDO	O	Serial Test Data Output

Truth Table

DINP	TDI	SHIFT	TCK	ENB	TDO
X	X	X	↑	0	TDOo
0	X	0	↑	1	0
1	X	0	↑	1	1
X	0	1	↑	1	0
X	1	1	↑	1	1
X	X	X	0	X	TDOo
X	X	X	1	X	TDOo
X	X	X	↓	X	TDOo

Timing Requirements

JTAG TAP CONTROLLER MACROFUNCTION

TAP controller macrofunction consists of instruction register and data register scan paths, a bypass register, multiplexers and a 16-state finite state machine. The bypass register and instruction register are JTAG devices. TAP controller uses the largest available internal buffers (IVD8) to drive data register control signals.

Instruction register/decoder are external to TAP controller since the register length and instruction codes vary from one ASIC design to another. The instruction register consists of three JTINT1 macrocells. The instruction decoder is used to implement a minimum TAP configuration with a boundary scan register and an optional identification register.

TAP Controller Input Pin Description

Name	Mandatory	Description
BPSEL		Bypass select
DREGDI		Data register scan path data-in
IREGDI		Instruction register scan path data-in
TCK	•	Test clock
TDI	•	Test data input to the bypass register
TMS	•	Test mode select controlling state transitions of a finite state machine
TRSTN		Test reset input

TAP Controller Output Pin Description

Name	Mandatory	Description
DRE		Data register enable control output
IRE		Instruction register enable control output
RSTO		Reset output
SHFDR		Data register shift control output
SHFIR		Instruction register shift control output
TDO	•	Test data output
TDOE		TDO tri-state enable output
UPDATEDR		Data register update control output
UPDATEIR		Instruction register update control output

The bulleted pins (TCK, TDI, TMS and TDO) are mandatory pins associated with the IEEE P1149.1 standard test bus interface. TRSTN is an optional test reset input. It is possible to implement TAP without the test reset input indicated in the IEEE P1149.1 standard by setting TRSTN pin to high logic state. Alternatively, if a power-on reset capability is desired, TRSTN pin should be set to active low and connected to the power-on reset circuitry.

The 16 states of the finite state machine, diagrammed in the figure 9-3, also comply with the proposed IEEE P1149.1 standard. State transitions occur on the rising edge of TCK and are controlled by TMS. To ensure stable state transitions, TMS transitions occur on the falling edges of TCK. Capture, shift or update of test data take place on the next rising edge of TCK after the state transition or on each subsequent rising edge of TCK if no state transition occurs.

Figure 6-3. TAP Controller I/O Pin-Out Diagram

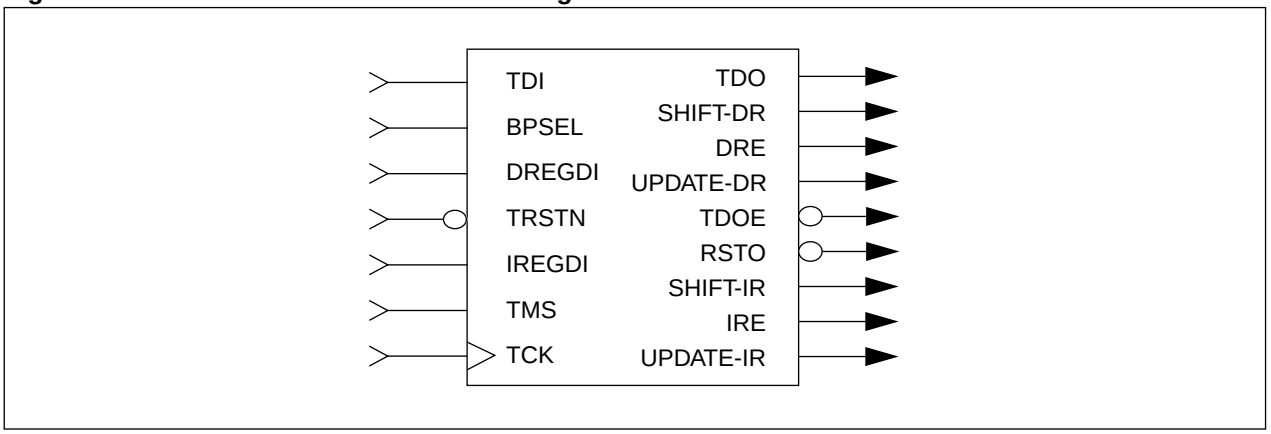

Figure 6-4. TAP Controller State Diagram

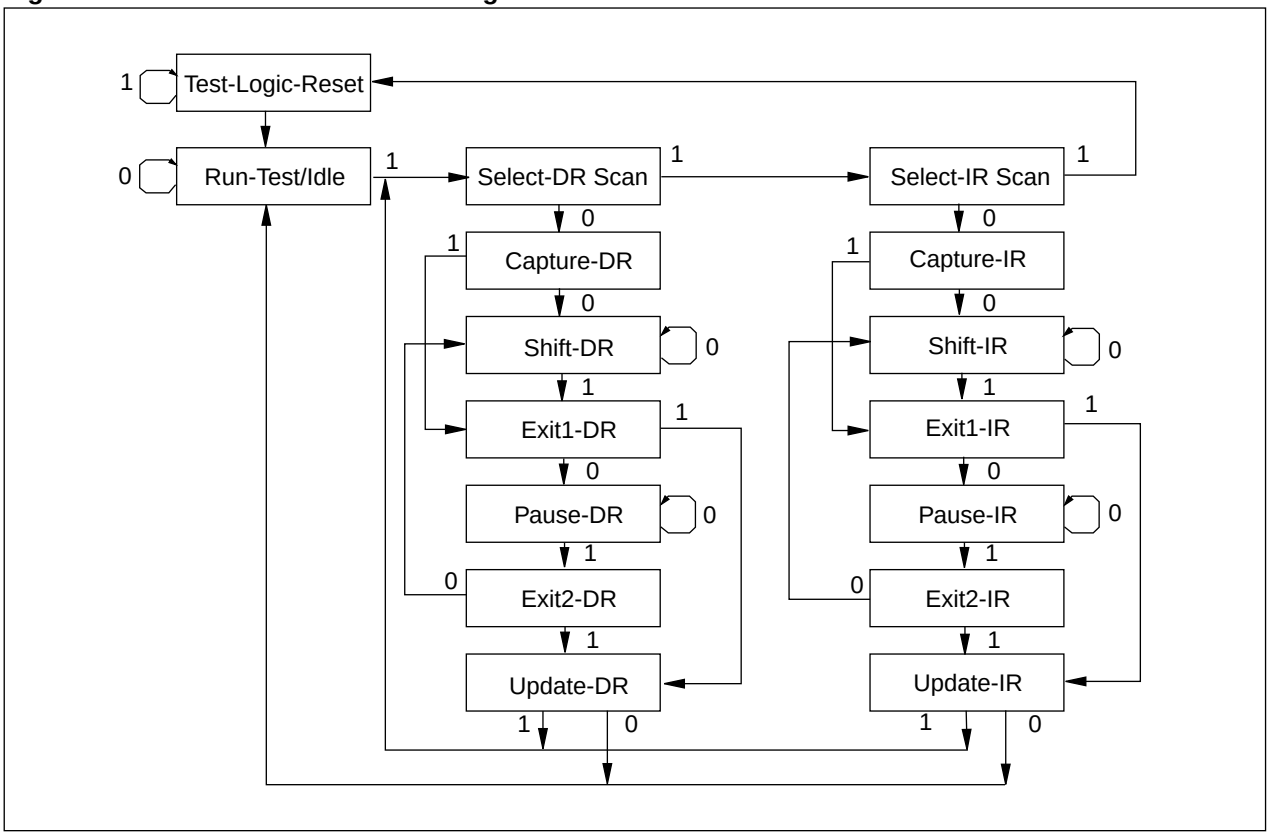

Behavior of TAP Controller States

Test-Logic-Reset

An initialization of the instruction register disables the test logic, allowing the on-chip system logic to operate normally. Irrespective of its original state, TAP controller reverts to Test-Logic-Reset when TMS is maintained high for five rising edges of TCK.

Run-Test/Idle

Idles in the state between scan operations or self-tests.

Capture-DR

Loads data parallelly into test data registers selected by the current instruction on the rising edge of TCK.

Shift-DR

Shifts data in the test data register between TDI and TDO one stage towards its serial output on each rising edge of TCK.

Pause-DR

Temporarily halts test data register shifts in the serial path between TDI and TDO.

Update-DR

Latches the data from the shift register path to the parallel output of test data registers on the falling edge of TCK.

Capture-IR

The shift-register contained in the instruction register loads a pattern of fixed logic value on the rising edge of TCK. It is possible to load design-specific data into shift-register stages that are not set to fixed values.

Shift-IR

Shifts data contained in the shift-register of the instruction register between TDI and TDO one stage towards its serial output on each rising edge of TCK.

Pause-IR

Temporarily halts shifting of the instruction register.

Update-IR

Latches the instruction shifted into the instruction register to the parallel output from the shift register path on the falling edge of TCK.

Select-DR-Scan, Select-IR-Scan, Exit1-DR, Exit2-DR, Exit1-IR, Exit2-IR

They are temporary controller states.

State Assignments for TAP Controller

Table 6-1. State Assignments

Controller State	State [3:0]	Controller State	State [3:0]
Exit2-DR	0	Exit2-IR	8
Exit1-DR	1	Exit1-IR	9
Shift-DR	2	Shift-IR	A
Pause-DR	3	Pause-IR	B
Select-IR Scan	4	Run-Test/Idle	C
Update-DR	5	Update-IR	D
Capture-DR	6	Capture-IR	E
Select-DR-Scan	7	Test-Logic-Reset	F

The bypass circuitry captures a low state during the data capture state of the finite state machine data cycle, as required by the proposed IEEE 1149.1 standard.

INSTRUCTION REGISTER/DECODER MACROFUNCTION

Instruction Register Macrofunction

The instruction register provides eight instructions in a minimum 3-bit device. These 3 bits are sufficient for operations of boundary scan cells and an instruction register, and three other operations such as the internal scan chains. Devices requiring more than eight instructions need a customer-specific design.

The instruction register allows an instruction to be shifted into the design. The instruction defines the test to be performed or the test data register to access or both. If a device identification register is present, the output register must be initialized to IDCODE instruction when TAP controller is in the Test-Logic-Reset state. Alternatively, it may be initialized to the bypass instruction. To support a fault isolation at the board-level, a constant binary '01' pattern is loaded into the least significant bits of the instruction register when it is in the Capture-IR state.

Instruction Decoder Macrofunction

The instruction decoder operates with the instruction register to provide boundary scan control. Designs requiring other options need a customer-specific design.

Instruction Decoder Input Pin Description:

Name	Description
INST (2:0)	Instruction register input

Instruction Decoder Output Pin Description:

Name	Description
0_Mode	Boundary scan output mode control
I_Mode	Boundary scan input mode control

The instruction decoder has the following truth table.

INST(2)	INST(1)	INST(0)	I_Mode	0_Mode
0	0	0	0	1
0	0	1	1	1
0	1	0	0	0
0	1	1	0	0
1	0	0	0	0
1	0	1	0	0
1	1	0	0	0
1	1	1	0	0

IMPLEMENTATION OF IEEE P1149.1/JTAG

The following design procedures should be followed for ASIC implementation of IEEE P1149.1/JTAG using SEC boundary scan cells:

1. Allocate four (optionally five) package pins for testing.
2. Generate a bonding diagram, including provision for the corner pads that cannot be used for boundary scan I/Os.
3. Configure the top level device symbol with the same pin-out sequence as the packaged device.
4. Select appropriate boundary scan macrocells, JTBI1, JTCK, JTIN1 and JTOUT1, for the boundary-scan I/O pads. JTCK and JTIN1 must be associated with inputs; JTOUT1 with outputs and JTBI1 with bi-directional inputs and outputs.
5. ASIC clock inputs generally use JTCK macrocell, but it may be used for other critical inputs where performance considerations dominate. JTOUT1 macrocells are used for each output pin and JTBI1 macrocells are used by bi-directional pins.
6. JTAG inputs (TDI, TCK, TMS), output (TDO) and optional TRSTN are connected to TAP controller. The boundary scan register and the instruction register are connected to TDI and TCK inputs. Inputs, TDI, TMS and TRSTN should have input pull-up resistors.
7. To start the boundary scan chain sequence, connect any TDI input to JTBI1, JTCK, JTIN1, or JTOUT1 macrocells. The chain sequence proceeds to each adjacent macrocell I/O pad until terminated. TDO output of the final macrocell is connected to DREGDI input of TAP controller. Similarly, the terminal TDO output of the instruction register is connected to IREGDI of TAP controller.
8. Instruction register and data register control signals are connected to the instruction register and boundary scan registers, and INST signal lines from the instruction register are connected to the instruction decoder which supplies the control signals BPSEL, I_Mode and O_Mode for TAP controller and the boundary scan register. I_Mode is connected to JTIN1 macrocells and O_Mode is connected to JTOUT1 macrocells. I_Mode, O_Mode and MODE1 are also connected to the appropriate inputs of JTBI1 macrocells.
9. I_MODE output is connected to a IVD8 macrocell and TN inputs of the bi-directional and tri-state output buffers associated with the respective I/O pads. Other buffers may be required if there are a large number of bi-directional or tri-state pads.
10. If the design requires internal tri-state enable control signals, an additional JTINT1 macrocell is needed for each enable. Internal enable macrocells should be connected to TAP controller RSTO signal and O_MODE control line. JTIN1 macrocell is used for external tri-state enable input signals and should be connected to TAP controller RSTO signal and I_MODE control line.
11. Generate the test patterns to test JTAG portion of the design.

SYSTEM CLOCK CONSIDERATIONS

Test and system clocks must be synchronized carefully. All phases of the system clock should be gated on and off at a central point within the system. When TMS input is high, TCK can run continuously and test modes is disabled.
