

7.3W DUAL AUDIO POWER IC

The KIA6248K is dual audio power amplifier for application.

It contains various kind of protectors and the function of stand-by switch.

FEATURES

- Output Power
 - : $P_{OUT(1)}=7.3W$ (Typ.)
($V_{CC}=13.2V$, $R_L=2\Omega$, $f=1kHz$, THD=10%)
 - : $P_{OUT(2)}=6.4W$ (Typ.)
($V_{CC}=14.4V$, $R_L=4\Omega$, $f=1kHz$, THD=10%)
 - : $P_{OUT(3)}=5.3W$ (Typ.)
($V_{CC}=13.2V$, $R_L=4\Omega$, $f=1kHz$, THD=10%)
- Total Harmonic Distortion
 - : THD=0.1%(Typ.)
($V_{CC}=13.2V$, $R_L=4\Omega$, $f=1kHz$, $P_{OUT}=1W$)
- Built-in Stand-by Switch Function
 - : $I_{STBY}=1\mu A$ (Typ.)
(With ⑨ pin set at High, power is turned ON.)
- Built-in Various Protection Circuits
 - : OVER Voltage, Thermal Shut Down
Out to GND, out to V_{CC} Short
- Built-in Junction Temperature Detection Function
(Pin ① : $10mW/^\circ C$)
- Operation supply voltage range : $V_{CC}=6\sim 18V$.

APPLICATION CIRCUIT (BTL MODE)

CAUTION AND APPLICATION METHOD

(Description is made only on the single channel.)

1. Voltage Gain Adjustment

The closed loop voltage gain (G_V) is determined by R_1 , R_2 and R_f .

$$G_V = 20 \log \frac{R_f + R_1 + R_2}{R_f + R_1} \text{ (dB)}$$

When $R_f=0$, $G_V=52\text{dB}$ (Typ.) is given.

The voltage gain is reduced when R_f is increased. (Fig.2)

With the voltage gain reduced, since the oscillation stability is reduced, refer to the items 3.

(Fig.1)

(Fig.2)

2. Stand-by SW Function

By means of controlling pin ⑨ (Stand-by terminal) to high and low, the power supply can be set to ON and OFF. The threshold voltage of pin ⑨ is set at 2.1V(3V_{BE}), and the power supply current is about 1μA(Typ.) at the stand-by state.

Control Voltage pin ⑨ : V(SB)

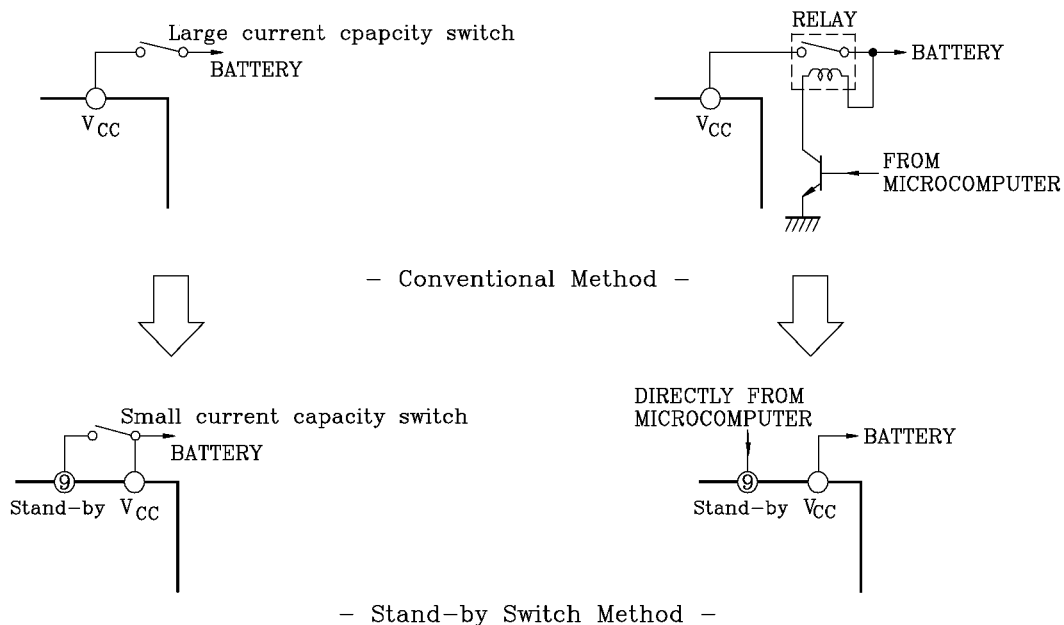

Stand-by	Power	V(SB) (V)
ON	OFF	0~2
OFF	ON	3~V _{CC}

(Fig.3) With pin ⑨ set to High, Power is turned ON

Advantage of Stand-by SW

- (1) Since V_{CC} can directly be controlled to ON, OFF by the microcomputer, the switching relay can be omitted.
- (2) Since the control current is microscopic, the switching relay of small current capacity is satisfactory for switching.

3. Preventive Measure Against Oscillation

C_{OSC} : For preventing the oscillation, it is advisable to use C_{OSC} , the condenser of polyester film having small characteristic fluctuation of the temperature and the frequency.

The resistance R to be series applied to C_{OSC} is effective for phase correction of high frequency, and improves the oscillation allowance.

- (1) Voltage gain to be used (G_V Setting)
- (2) Capacity value of condenser
- (3) Kind of condenser
- (4) Layout of printed board

In case of its use with the voltage gain G_V reduced or with the feedback amount increased, care must be taken because the phase-inversion is caused by the high frequency resulting in making the oscillation liable generated.

4. Junction Temperature Detecting pin ①

Using temperature characteristic of a band gap circuit and in proportion to junction temperature, pin① DC voltage : V_2 rises at about $+10\text{mV}/^\circ\text{C}$ temperature characteristic. So, the relation between V_2 at $T_j=25^\circ\text{C}$ and V_{2x} at $T_j=x^\circ\text{C}$ is decided by the following expression :

$$T(x^\circ\text{C}) = \frac{V_{2x} + V_2(25^\circ\text{C})}{10\text{mV}/^\circ\text{C}} + 25(^\circ\text{C})$$

In deciding a heat sink size, a junction temperature can be easily made clear by measuring voltage at this pin while a backside temperature of IC was so far measured using a thermocouple type thermometer.

(Fig.4)

5. Pop Noise

The pop noise is reduced by the time constant τ of pin⑧ : smoothing.

Therefore, we recommend $C_S=100\mu\text{F}$, which is between pin⑧ and GND, because the pop noise will become worse by using the smaller capacity of C_S .

$C_S=100\mu\text{F}$: RECOMMENDED VALUE

OUTPUT DC VOLTAGE 2V/DIV, 20ms/DIV
OUTPUT AC VOLTAGE 1V/DIV, 20ms/DIV

$C_S=10\mu\text{F}$: LESS THAN RECOMMENDED VALUE

OUTPUT DC VOLTAGE 2V/DIV, 20ms/DIV
OUTPUT AC VOLTAGE 1V/DIV, 20ms/DIV
