PIN FUNCTION DESCRIPTION

Pin	Name	Input Function
CLK	System clock	Active on the positive going edge to sample all inputs.
<u>CS</u>	Chip select	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	Clock enable	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby.
A ₀ ~ A ₁₁	Address	Row/column addresses are multiplexed on the same pins. Row address : RA ₀ ~ RA ₁₁ , Column address : CA ₀ ~ CA ₈

<u>CAS</u>	Column address strobe	Latches column addresses on the positive going edge of the CLK with <u>CAS</u> low. Enables column access.
<u>WE</u>	Write enable	Enables write operation and row precharge. Latches data in starting from CAS, WE active.
L(U)DQM	Data input/output mask	Makes data output Hi-Z, t _{SHZ} after the clock and masks the output. Blocks data input when L(U)DQM active.
DQ ₀ ~ 15	Data input/output	Data inputs/outputs are multiplexed on the same pins.
V _{DD} /V _{SS}	Power supply/ground	Power and ground for the input buffers and the core logic.
V _{DDQ} /V _{SSQ}	Data output power/ground	Isolated power supply and ground for the output buffers to provide improved noise immunity.

 4. In case of row precharge interrupt, auto precharge and read burst stop.
 5. $t_{RD}=1CLK$ and $t_{DAL}=1CLK+20ns$ is also supported.
SAMSUNG recommends $t_{RD}=2CLK$ and $t_{DAL}=2CLK + 20ns$.

- Notes :**
- Parameters depend on programmed CAS latency.
 - If clock rising time is longer than 1ns, $(tr/2-0.5)ns$ should be added to the parameter.
 - Assumed input rise and fall time (tr & tf) = 1ns.
If tr & tf is longer than 1ns, transient time compensation should be considered, i.e., $[(tr + tf)/2-1]ns$ should be added to the parameter.

Notes : 1. OP Code : Operand codeA₀ ~ A₁₁ & BA₀ ~ BA₁ : Program keys. (@ MRS)

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 CLK cycles of MRS.

3. Auto refresh functions are as same as CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA₀ ~ BA₁ : Bank select addresses.If both BA₀ and BA₁ are "Low" at read, write, row active and precharge, bank A is selected.If both BA₀ is "Low" and BA₁ is "High" at read, write, row active and precharge, bank B is selected.If both BA₀ is "High" and BA₁ is "Low" at read, write, row active and precharge, bank C is selected.If both BA₀ and BA₁ are "High" at read, write, row active and precharge, bank D is selected.If A_{10/AP} is "High" at row precharge, BA₀ and BA₁ is ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at t_{RP} after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0),

but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
