*512K x 8Bit CMOS Dynamic RAM with Extended Data Out*

## DESCRIPTION

This is a family of 524,288 x 8 bit Extended Data Out Mode CMOS DRAMs. Extended Data Out Mode offers high speed random access of memory cells within the same row. Power supply voltage(+5.0V or +3.3V), Access time(-5,-6,-7), power consumption(Normal or Low power) and package type(SOJ or TSOP-II) are optional features of this family. All of this family have $\overline{CAS}$-before-$\overline{RAS}$ refresh, $\overline{RAS}$-only refresh and Hidden refresh capabilities. Furthermore, Self-refresh operation is available in L-version. This 512Kx8 EDO Mode DRAM family is fabricated using Samsung′s advanced CMOS process to realize high band-width, low power consumption and high reliability. It may be used as main memory unit for microcomputer, personal computer and portable machines.

## NOTES

1. An initial pause of 200us is required after power-up followed by any 8 $\overline{RAS}$-only refresh or $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles before proper device operation is achieved.
2. $V_{IH}$(min) and $V_{IL}$(max) are reference levels for measuring timing of input signals.
   Transition times are measured between $V_{IH}$(min) and $V_{IL}$(max) and are assumed to be 2ns for all inputs.
3. Measured with a load equivalent to 2 TTL(5V)/1 TTL(3.3V) loads and 100pF.
4. Operation within the $t_{RCD}$(max) limit insures that $t_{RAC}$(max) can be met. $t_{RCD}$(max) is specified as a reference point only.
   If $t_{RCD}$ is greater than the specified $t_{RCD}$(max) limit, then access time is controlled exclusively by $t_{CAC}$.
5. Assumes that $t_{RCD} \geq t_{RCD}$(max).
6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to $V_{oh}$ or $V_{ol}$.
7. $t_{WCS}$, $t_{RWD}$, $t_{CWD}$, $t_{AWD}$ and $t_{CPWD}$ are non restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$(min), the cycle is an early write cycle and the data output will remain high impedance for the duration of the cycle. If $t_{CWD} \geq t_{CWD}$(min), $t_{RWD} \geq t_{RWD}$(min), $t_{AWD} \geq t_{AWD}$(min) and $t_{CPWD} \geq t_{CPWD}$(min) then the cycle is a read-modify-write cycle and the data output will contain the data read from the selected address. If neither of the above conditions is satisfied, the condition of the data out is indeterminate.
8. Either $t_{RCH}$ or $t_{RRH}$ must be satisfied for a read cycle.
9. These parameters are referenced to $\overline{CAS}$ falling edge in early write cycles and to $\overline{W}$ falling edge in $\overline{OE}$ controlled write cycle and read-modify-write cycles.
10. Operation within the $t_{RAD}$(max) limit insures that $t_{RAC}$(max) can be met. $t_{RAD}$(max) is specified as a reference point only.
    If $t_{RAD}$ is greater than the specified $t_{RAD}$(max) limit, then access time is controlled by $t_{AA}$.
11. $t_{ASC} \geq 6$ns, Assume $t_T$ = 2.0ns
12. If $\overline{RAS}$ goes high before $\overline{CAS}$ high going, the open circuit condition of the output is achieved by $\overline{CAS}$ high going.
    If $\overline{CAS}$ goes high before $\overline{RAS}$ high going, the open circuit condition of the output is achieved by $\overline{RAS}$ high going.
13. If $t_{RASS} \geq 100$us, then $\overline{RAS}$ precharge time must use $t_{RPS}$ instead of $t_{RP}$.
14. For $\overline{RAS}$-only refresh and burst $\overline{CAS}$-before-$\overline{RAS}$ refresh mode, 1024(1K) cycle of burst refresh must be executed within 16ms before and after self refresh, in order to meet refresh specification.
15. For distributed $\overline{CAS}$-before-$\overline{RAS}$ with 15.6us interval, $\overline{CAS}$-before-$\overline{RAS}$ refresh should be executed with in 15.6us immediately before and after self refresh in order to meet refresh specification.
