DESCRIPTION

These parts consist of two negative-edge-triggered J-K flip-flops with independent J, K, preset, clear and clock inputs and complementary outputs. The J-K inputs at each flip-flop are enabled when the clock goes high. The input data are transferred to the outputs on the negative-going edge of the clock pulse, provided the setup requirements have been met.

These devices provide speeds and drive capability equivalent to their ALSTTL counterparts and yet maintain CMOS power levels. The input and output voltage levels allow direct interface with TTL, NMOS and CMOS devices without any external components.

All inputs and outputs are protected from damage due to static discharge by internal diode clamps to V_{CC} and ground.

PRE	CLR	CLK	J	K	Q	Q-bar
L	H	X	X	X	H	L
H	L	X	X	X	L	H
L	L	X	X	X	H*	H*
