DESCRIPTION

These high-speed octal buffers and line drivers are designed specificaly to improve both the performance and density of 3-state memory address drivers, clock drivers, and bus-oriented receivers and transmitters.

The designer has the choice of combinations of inverting non-inverting outputs and symmetrical complementary input control (both active-low, or one active-low, the other active-high).

These devices provide speeds and drive capability equivalent to their ALSTTL counterparts and yet maintain CMOS power levels. The input and output voltage levels allow direct interface with TTL, NMOS and CMOS devices without any external components.

All inputs and outputs are protected from damage due to static discharge by internal diode clamps to Vcc and ground.
