## PRODUCT OVERVIEW

### S3C8-SERIES MICROCONTROLLERS

Samsung's S3C8 series of 8-bit single-chip CMOS microcontrollers offers a fast and efficient CPU, a wide range of integrated peripherals, and various mask-programmable ROM sizes. Important CPU features include:

- Efficient register-oriented architecture
- Selectable CPU clock sources
- Idle and Stop power-down mode release by interrupt
- Built-in basic timer with watchdog function

A sophisticated interrupt structure recognizes up to eight interrupt levels. Each level can have one or more interrupt sources and vectors. Fast interrupt processing (within a minimum six CPU clocks) can be assigned to specific interrupt levels.

### S3C80F7/C80F9/C80G7/C80G9 Microcontroller

The S3C80F7/C80F9/C80G7/C80G9 single-chip CMOS microcontroller is fabricated using a highly advanced CMOS process and is based on Samsung's newest CPU architecture.

The S3C80F9/C80G9 is the microcontroller which has 32-Kbyte mask-programmable ROM and S3C80F7/C80G7 is the microcontroller which has 24-Kbyte mask-programmable ROM.

The S3P80F9/P80G9 is the microcontroller which has 32-Kbyte one-time-programmable EPROM and S3P80F7/P80G7 is the microcontroller which has 24-Kbyte one-time-programmable EPROM.

Using a proven modular design approach, Samsung engineers developed S3C80F7/C80F9/C80G7/C80G9 by integrating the following peripheral modules with the powerful SAM87 RC core:

- Internal LVD circuit and 16 bit-programmable pins for external interrupts.
- One 8-bit basic timer for oscillation stabilization and watchdog function (system reset).
- One 8-bit timer/counter and one 16-bit timer/counter with selectable operating modes.
- One 8-bit counter with auto-reload function and one-shot or repeat control.

The S3C80F7/C80F9/C80G7/C80G9 is a versatile general-purpose microcontroller which is especially suitable for use as remote transmitter controller. It is currently available in a 32-pin SOP, 42-pin SDIP and 44-pin QFP package.

Table 15-7. Oscillation Characteristics

(T<sub>A</sub> = -40 °C + 85 °C)

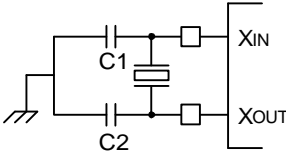

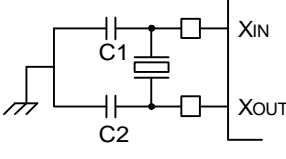

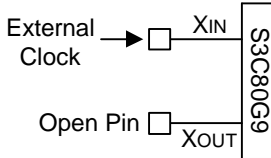

Oscillator	Clock Circuit	Conditions	Min	Typ	Max	Unit
Crystal		CPU clock oscillation frequency	1	–	4	MHz
Ceramic		CPU clock oscillation frequency	1	–	4	MHz
External clock		X <sub>IN</sub> input frequency	1	–	4	MHz

Table 15-8. Oscillation Stabilization Time

(T<sub>A</sub> = -40 °C + 85 °C, V<sub>DD</sub> = 4.5 V to 5.0 V)

Oscillator	Test Condition	Min	Typ	Max	Unit
Main crystal	f <sub>OSC</sub> > 400 kHz	–	–	20	ms
Main ceramic	Oscillation stabilization occurs when V <sub>DD</sub> is equal to the minimum oscillator voltage range.	–	–	10	ms
External clock (main system)	X <sub>IN</sub> input High and Low width (t <sub>XH</sub> , t <sub>XL</sub> )	25	–	500	ns
Oscillator stabilization wait time	t <sub>WAIT</sub> when released by a reset <sup>(1)</sup>	–	2 <sup>16</sup> / f <sub>OSC</sub>	–	ms
	t <sub>WAIT</sub> when released by an interrupt <sup>(2)</sup>	–	–	–	ms

**NOTES:**

- f<sub>OSC</sub> is the oscillator frequency.
- The duration of the oscillation stabilization time (t<sub>WAIT</sub>) when it is released by an interrupt is determined by the setting in the basic timer control register, BTCON.
