SLOTTED OPTICAL SWITCHES PHOTOTRANSISTOR OUTPUT

KT830 - KT840 SERIES

PACKAGE L

PACKAGE W

DESCRIPTION

The KT830/KT840 series of slotted optical switches provide the design engineer with the flexibility of a custom device from a standard product line. Building from a standard housing with a .125" wide slot, the user can specify (1) Electrical output parameters, (2) Lead or wire termination, (3) Lead spacing, (4) Discrete shell, and (5) Aperture widths.

All housings are an opaque grade of injection-molded polysulfone (P1700-935) to minimize the assembly's sensitivity to ambient radiation, both visible and near-infrared. Discrete shells (exposed only on the parallel faces inside the device throat) are either IR transmissive polysulfone (P1700-1615) for applications where aperture contamination may occur, or opaque polysulfone where maximum protection against ambient radiation is a concern.

The "L" series of switches have .020" square leads and can be specified for either .220" or .320" spacing.

The "W" series of switches are terminated with 24 inches of 7 strand, 26 AWG, UL 1429 insulated wire on each terminal. Insulation colors and functions are:

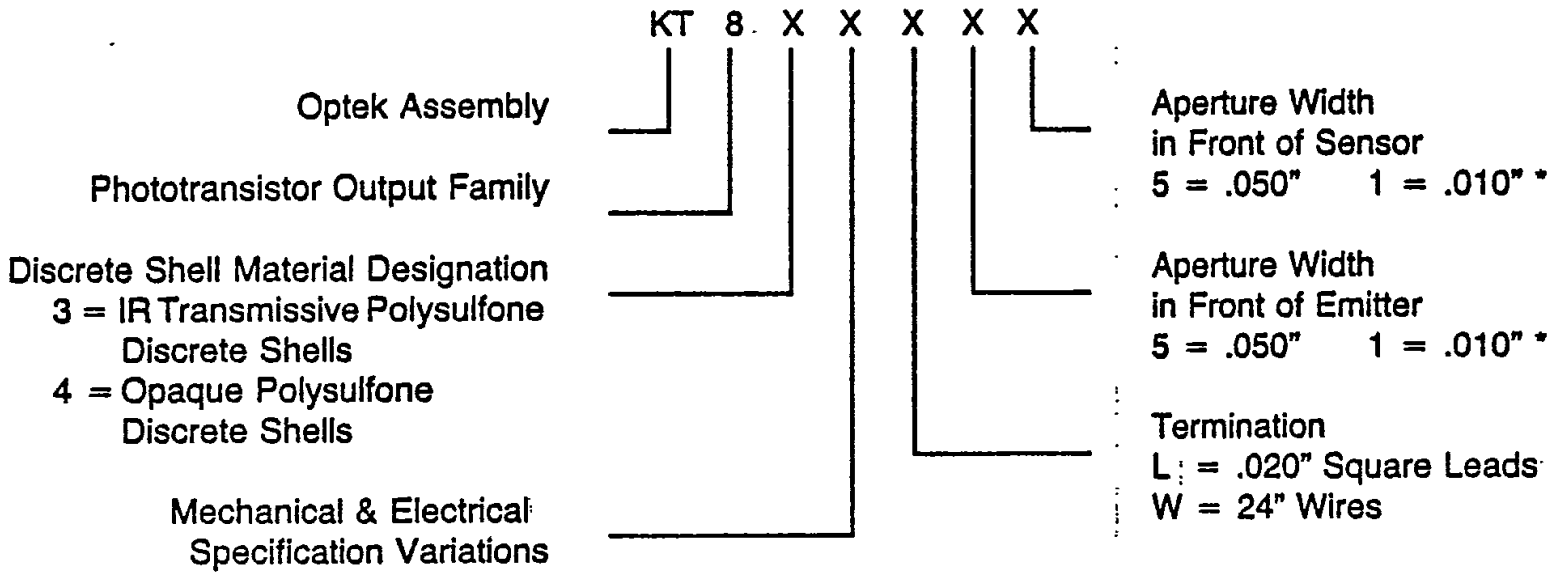

RED - IRED Anode
BLACK - IRED Cathode

WHITE - Phototransistor Collector
GREEN - Phototransistor Emitter

Other wire lengths and/or colors are available. Contact your local representative or call the factory.

MECHANICAL CONSTRUCTION

All housings are an opaque grade of injection-molded polysulfone (P1700-935) to minimize the assembly's sensitivity to ambient radiation, both visible and near-infrared. Discrete shells (exposed only on the parallel faces inside the device throat) are either IR transmissive polysulfone (P1700-1615) for applications where aperture contamination may occur, or opaque polysulfone (P1700-935) with aperture openings, where maximum protection against ambient radiation is a concern.
