## LA7137M — Monolithic Linear IC DVD Analog Video Output I/F IC

### Overview

The LA7137M is a video output interface IC for DVD players and is optimal as the driver IC for DVD players that provide composite signal/S signal, component signal, and RGB signal video outputs.

Since this IC integrates a Y/C mixer on the same chip, the D/A converter composite output can be omitted. The LA7137M also integrates S1 and S2 DC voltage and D/A converter reference voltage generation on chip, allowing most components other than the drivers to be omitted.

### Functions

- Clamps
- Amplifier
- 75Ω driver
- Y/C mixer
- S1 and S2 DC output
- D/A converter reference voltage output

### Features

- Video signal-to-noise ratio : -80dB
- Frequency characteristics : flat to 10MHz
- Y/C time difference : less than 2ns
- Signal dynamic range : 170IRE.
- Can support all major signal types : composite/S signals, component signals, and baseband (RGB) signals. Furthermore, the IC input type can be switched by the system microcontroller (since the input capacitors are shared).
- Two 75Ω driver systems that can be independently muted by the system microcontroller.
- The clamp pulses required for component signal input are generated internally in the IC.
- Either of two amplifier gain levels, 8.5 and 6dB, can be selected.
- A built-in regulator circuit provides a stable DC voltage output that is independent of V<sub>CC</sub> fluctuations.

### Specifications

#### Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V <sub>CC</sub> max		10.0	V
Allowable power dissipation	Pd max	Ta ≤ 75°C * Mounted on a board	525	mW
Operating temperature	Topr		-20 to +75	°C
Storage temperature	Tstg		-40 to +150	°C

\* Only when mounted on a 114.3×76.1×1.6mm<sup>3</sup> glass epoxy board

- Any and all SANYO Semiconductor products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO Semiconductor representative nearest you before using any SANYO Semiconductor products described or contained herein in such applications.
- SANYO Semiconductor assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor products described or contained herein.

## Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	$V_{CC}$		8.0	V
Operating supply voltage range	$V_{CC\text{ op}}$		7.6 to 8.4	V

## Electrical Characteristics at $T_a = 25^\circ\text{C}$ , $V_{CC} = 7.6$ to $8.4\text{V}$

Parameter	Symbol	Input signal	Test point	Conditions	Ratings			Unit
					min	typ	max	
Current drain 1	$I_{CC1}$			Video system current drain	14.3	17.9	21.5	mA
Current drain 2	$I_{CC2}$			75 $\Omega$ driver current drain ; no signal	14.4	18.0	21.6	mA
(A) For a pin 10 (Y signal) input when composite/S selected								
Amplifier gain (low)	$G_{YM}$	Sig.1	T13/15	The gain for a 996mVp-p 100kHz signal	5.05	5.27	5.48	dB
Amplifier gain (high)	$G_{YH}$	Sig.1	T13/15	The gain for a 761mVp-p 100kHz signal	7.38	7.6	7.81	dB
Clamp voltage	$C_{10H}$	Sig.1	T10	The T10 sync tip potential for a 761mVp-p input	3.85	4.20	4.55	V
(B) For a pin 6 (chrominance signal) input when composite/S selected								
Amplifier gain (low)	$G_{CM}$	Sig.2	T17/19	The gain for a 711mVp-p 3.58MHz signal	5.05	5.27	5.48	dB
Amplifier gain (high)	$G_{CH}$	Sig.2	T17/19	The gain for a 544mVp-p 3.58MHz signal	7.38	7.6	7.81	dB
Chrominance signal input DC voltage	$D_6H$	Sig.2	T6	The T6 offset voltage for a 544mVp-p input	4.4	4.75	5.1	V
(C) For a pin 3 (composite signal) input when composite selected								
Amplifier gain (low)	$G_{SM1}$	Sig.3	T21/23	The gain for a 996mVp-p 100kHz signal	5.05	5.27	5.48	dB
Amplifier gain (high)	$G_{SH1}$	Sig.3	T21/23	The gain for a 761mVp-p 100kHz signal	7.38	7.6	7.81	dB
Clamp voltage	$C_3H$	Sig.3	T3	The T3 sync tip potential for a 761mVp-p input	4.0	4.35	4.7	V
(D) For a pins 6 and 10 (S signal) input when S is selected								
Amplifier gain (low)	$G_{SM2}$	Sig.1 Sig.2	T21/23	The gain for a 996mVp-p 100kHz signal or a 711mVpp 3.58kHz signal	4.92	5.27	5.61	dB
Amplifier gain (high)	$G_{SH2}$	Sig.1 Sig.2	T21/23	The gain for a 761mVp-p 100kHz signal or a 544mVpp 3.58kHz signal	7.25	7.6	7.94	dB
(E) The gain ratios between the different signals when composite is selected								
Y/chrominance amplifier gain ratio	$\Delta Y_C$	Sig.1 Sig.2	T13/15 T17/19	The ratio of the $G_{YH}$ gain for (A) and the $G_{CH}$ gain for (B)	-3	0	3	%
Y/composite amplifier gain ratio	$\Delta Y_{S1}$	Sig.1 Sig.3	T13/15 T21/23	The ratio of the $G_{YH}$ gain for (A) and the $G_{SH1}$ gain for (C)	-3	0	3	%
Chrominance/composite amplifier gain ratio	$\Delta C_{S1}$	Sig.2 Sig.3	T17/19 T21/23	The ratio of the $G_{CH}$ gain for (B) and the $G_{SH1}$ gain for (C)	-3	0	3	%
(F) The gain ratios between the different signals when S is selected								
Y/S amplifier gain ratio	$\Delta Y_{S2}$	Sig.1 Sig.2	T13/15 T21/23	The ratio of the $G_{YH}$ gain for (A) and the $G_{SH2}$ gain for (D)	-4.5	0	4.5	%
Chrominance/S amplifier gain ratio	$\Delta C_{S2}$	Sig.1 Sig.2	T17/19 T21/23	The ratio of the $G_{CH}$ gain for (B) and the $G_{SH2}$ gain for (D)	-4.5	0	4.5	%
(G) The pin 10 (Y signal) input when component is selected								
Amplifier gain (low)	$G_{YM}$	Sig.1	T13/15	The gain for a 996mVp-p 100kHz signal	5.05	5.27	5.48	dB
Amplifier gain (high)	$G_{YH}$	Sig.1	T13/15	The gain for a 761mVp-p 100kHz signal	7.38	7.6	7.81	dB
Y input clamp voltage	$C_{10H}$	Sig.1	T10	The T10 sync tip potential for a 761mVp-p input	3.85	4.20	4.55	V
(H) The pin 6 (B-Y or R-Y signal) input when component is selected								
Amplifier gain (low)	$G_{NM}$	Sig.4	T17/19	The gain for a 996mVp-p 100kHz signal	5.05	5.27	5.48	dB
Amplifier gain (high)	$G_{NH}$	Sig.4	T17/19	The gain for a 761mVp-p 100kHz signal	7.38	7.6	7.81	dB
Input pedestal clamp voltage	$P_6H$	Sig.4	T6	The T6 pedestal potential for a 761 mVp-p input	4.4	4.75	5.1	V
Amplifier gain (low)	$G_{NM}$	Sig.4	T21/23	The gain for a 996mVp-p 100kHz signal	5.05	5.27	5.48	dB

## Control Pin Functions

Pin No.	Pin state	Low	Open	High
1	Pin voltage	0 to 0.6V	1.55 to 1.75V	2.7 to 5V
	75Ω driver muting	13, 17, 21 muted	Not muted	15, 19, 23 muted
2	Pin voltage	0 to 0.6V	1.55 to 1.75V	2.7 to 5V
	Signal input type switching	Composite/S mode	Baseband mode	Component mode
11	Pin voltage	0 to 1V		2.7 to 8V (note)
	Amplifier gain switching	6dB		8.5dB
22	Pin voltage	0 to 1V		2.7 to 8V (note)
	Y/C mixer control	Y/C mixed mode		Composite mode

Note : Never apply a voltage higher than the V<sub>CC</sub> voltage at pins 9 and 20 to pin 11 or pin 22.

\* : Y/C mixed mode is illegal in modes other than composite/S mode.

\* : In composite mode, use pin 6 to input the chrominance signal capacitor-coupled, pin 3 for the clamped composite signal, and pin 10 for the clamped Y signal. However, in S mode, pin 3 will have no input.

In component mode, pins 3 and 6 will be pedestal clamped B-Y and R-Y signals, respectively, while pin 10 will be the clamped Y signal input.

In baseband mode, pins 3, 6, and 10 are all clamped inputs, for the RGB signals, respectively.

Pins 11 and 22 must never be left open.

Pin 4	Pin 5	Pin 16 output DC
0 to 1V	0 to 1V	Low (0V) → 4 : 3 mode
0 to 1V	2.6 to 5V	Middle (2.5V) → Letterbox mode
2.6 to 5V	0 to 1V	High (5V) → Squeezed mode
2.6 to 5V	2.6 to 5V	Illegal values

# LA7137M

## Design Guaranteed Items (at $T_a = 25^\circ\text{C}$ )

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
<Modes Other than Y/C Mixed Mode>						
Inter-channel crosstalk	CT	Input an $f = 4\text{MHz}$ signal to another channel such that the capacitor-coupled output becomes $1\text{Vp-p}$ . Measure the amplitude of the $4\text{MHz}$ component on the monitored channel. This parameter is stipulated to be the ratio of that level with the amplitude of the $4\text{MHz}$ component on that other channel.		-65	-60	dB
Video signal-to-noise ratio	SN	Input a white 100% signal and apply a $3.3\text{V}$ level to pin 11. Measure the signal-to-noise ratio in the output signal.		-80	-78	dB
Differential gain	DG	Input a standard $1\text{Vp-p}$ staircase signal (color) and leave pin 11 open. Measure the differential gain in the output signal. Note that the components shown in the test circuit diagram for this parameter must be inserted at this time.		0.5	2	%
Differential phase	DP	Input a standard $1\text{Vp-p}$ staircase signal (color) and leave pin 11 open. Measure the differential phase in the output signal. Note that the components shown in the test circuit diagram for this parameter must be inserted at this time.	-1	0	1	dB
<Y/C Mixed Mode>						
Inter-channel crosstalk	CT	Input an $f = 4\text{MHz}$ signal to another channel such that the capacitor-coupled output becomes $1\text{Vp-p}$ . Measure the amplitude of the $4\text{MHz}$ component on the monitored channel. This parameter is stipulated to be the ratio of that level with the amplitude of the $4\text{MHz}$ component on that other channel.		-65	-60	dB
Video signal-to-noise ratio	SN	Input a white 100% signal and apply a $3.3\text{V}$ level to pin 11. Measure the signal-to-noise ratio in the output signal.		-74	-72	dB
Differential gain	DG	Input a standard $761\text{mVp-p}$ staircase signal (color) and apply a $3.3\text{V}$ level to pin 11. Measure the differential gain in the output signal. Note that the components shown in the test circuit diagram for this parameter must be inserted at this time.		4	5.5	%
Differential phase	DP	Input a standard $761\text{mVp-p}$ staircase signal (color) and apply a $3.3\text{V}$ level to pin 11. Measure the differential gain in the output signal. Note that the components shown in the test circuit diagram for this parameter must be inserted at this time.	-1	0.5	1.5	dB

## Pin Functions

For more information on the pin functions, see the I/O circuit diagrams, and for an operating description, see the block diagram.

Note that the data shown below consists of typical values and that detailed ratings are provided in the Electrical Characteristics.

Pin No.	Pin	I/O	Pin voltage	I/O impedance	Description	Equivalent circuit
10	Y-IN	I	4.2V	Clamp form	<p>Input pin for either the Y or a baseband signal. This pin is used for the Y signal for composite/S and component signal input, and for one of the RGB signals with sync. Keyed clamping (clamping at the lowest point in the signal, that is, at the sync tip) is applied whichever signal is input.</p> <p>If a component signal is input, sync separation is performed and a clamp pulse for pedestal clamping is produced. The clamped signal is amplified by an amplifier that can be switched between two levels so that it becomes 2Vp-p with an output amplitude of 140IRE.</p>	
13	Y.OUT1	O	2.7V	11.6Ω	75Ω driver output for the signal input to pin 10. The pin 10 output signal is split into two, and one is passed through a muting circuit that mutes when pin 1 is low (0V) and output to the 75Ω driver.	
15	Y.OUT2	O	2.7V	11.6Ω	75Ω driver output for the signal input to pin 10. Of the pin 10 input signals, the other signal is passed through a muting circuit that mutes when pin 1 is high (3.3 to 5.0V) and output to the 75Ω driver.	
6	C-IN	I	4.8V	10kΩ	<p>Input pin for chrominance, component, and baseband signals. The chrominance signal must be input to this pin when a composite/S signal input is used. The signal must be capacitor coupled. The B-Y or R-Y signal must be input to this pin when a component signal is input. The signal is clamped at the pedestal level. Any one of the RGB with sync signals must be input to this pin when a baseband signal is input. Keyed clamping will be applied to the signal. The capacitor coupled or clamped signal is amplified by an amplifier that can be switched between two levels so that it becomes 2Vp-p with an output amplitude of 140IRE.</p>

Pin No.	Pin	I/O	Pin voltage	I/O impedance	Description	Equivalent circuit
23	COMPOSITE. OUT2	O	3.57V	11.6Ω	75Ω driver output for the signal input to pin 3. Of the pin 3 input signals, the other signal is passed through a muting circuit that mutes when pin 1 is high (3.3 to 5.0V) and output to the 75Ω driver.	
1	MUTE-SW	I	1.7V	21kΩ	Controls the muting applied to the output signals. This pin can be controlled from a 3.3 to 5V power supply microcontroller. (See the control pin function table.)	
2	SIGNAL-IN.SW	I	1.7V	21kΩ	Switches the input circuit types of pins 3 and 6 to match the type of the input signal. This pin can be controlled from a 3.3 to 5V power supply microcontroller. (See the control pin function table.)	
4	SQUEEZE.SW	I	2.40V	9.0GΩ	Inputs squeeze control information from the system microcontroller. This pin can be controlled from a 3.3 to 5V power supply microcontroller. (See the control pin function table.)	
5	LETTER-BOX.SW	I	2.43V	8.1GΩ	Inputs letterbox control information from the system microcontroller. This pin can be controlled from a 3.3 to 5V power supply microcontroller. (See the control pin function table.)

Pin No.	Pin	I/O	Pin voltage	I/O impedance	Description	Equivalent circuit
16	C-DC.OUT	O	4.7V	4.1Ω	The LA7137M creates, and outputs from this pin, a stabilized DC voltage based on the control information input to pins 4 and 5. This pin outputs a low level (0V) for 4 : 3 mode, a middle level (2.2V) for letterbox mode, and a high level (5V) for squeeze mode. A 10kΩ resistor must be inserted to superimpose the DC voltage output from pin 17 on the capacitor coupled chrominance output. (See the application circuit diagram.)	
11	AMP-SW	I	2.4V	9.0GΩ	Control pin that switches the amplifier gain to match the amplitude of the input signal. This pin's input level can be switched between V <sub>CC</sub> and ground on the printed circuit board even by a 3.3 to 5.0V power supply microcontroller. (See the control pin functions table.)	
22	COMPOSITE-S.SW	P	2.4V	9.0GΩ	Controls the on/off state of the Y/C mixer. When using a D/A converter that omits the composite output, the Y/C mixer must be turned on. At the same time as mixing the Y signal input to pin 10 with the chrominance signal input to pin 6, pin 3 will be dropped to ground. When pin 2 control specifies a signal type other than composite/S signal, this pin must be tied high. This pin's input level can be switched between V <sub>CC</sub> and ground on the printed circuit board even by a 3.3 to 5.0V power supply microcontroller. (See the control pin functions table.)	
12	DAC-DC.OUT	O	3.4V	4.0Ω	Outputs a DC reference voltage for use by a D/A converter. In particular, it outputs a 3.3V level. This reference voltage is unaffected by V <sub>CC</sub> fluctuations or temperature and can be used in conjunction with a resistor divider to produce the DC level required by the D/A converter.	
7	GND1	P	0V		Ground for systems other than the 75Ω driver system.

Pin No.	Pin	I/O	Pin voltage	I/O impedance	Description	Equivalent circuit
8	REG	O	4.35V	1.5k $\Omega$	External pin for the regulator circuit that creates the IC internal reference voltage. Since the IC internal noise is influenced by the stability of this regulator, we recommend connecting a 470 $\mu$ F capacitor to this pin to if assuring a -80dB signal-to-noise ratio is required.	
9	V <sub>CC1</sub>	P	8V		V <sub>CC</sub> (8V applied) for systems other than the 75 $\Omega$ driver system. Insert a 47 $\mu$ F capacitor between this pin and pin 7.	
20	V <sub>CC2</sub>	P	8V		V <sub>CC</sub> (8V applied) for the 75 $\Omega$ driver system. Insert a 47 $\mu$ F capacitor between this pin and pin 14, 18, or 24. The PCB layout related to this pin requires care due to the large amplitude output signals handled.	
14	GND2C	P	0V		Ground for the 75 $\Omega$ driver system (pin 13 or 15). The PCB layout related to this pin requires care due to the large amplitude output signals handled.	
18	GND2B	P	0V		Ground for the 75 $\Omega$ driver system (pin 17 or 19). The PCB layout related to this pin requires care due to the large amplitude output signals handled.	
24	GND2A	P	0V		Ground for the 75 $\Omega$ driver system (pin 21 or 23). The PCB layout related to this pin requires care due to the large amplitude output signals handled.

## Sample Application Circuit

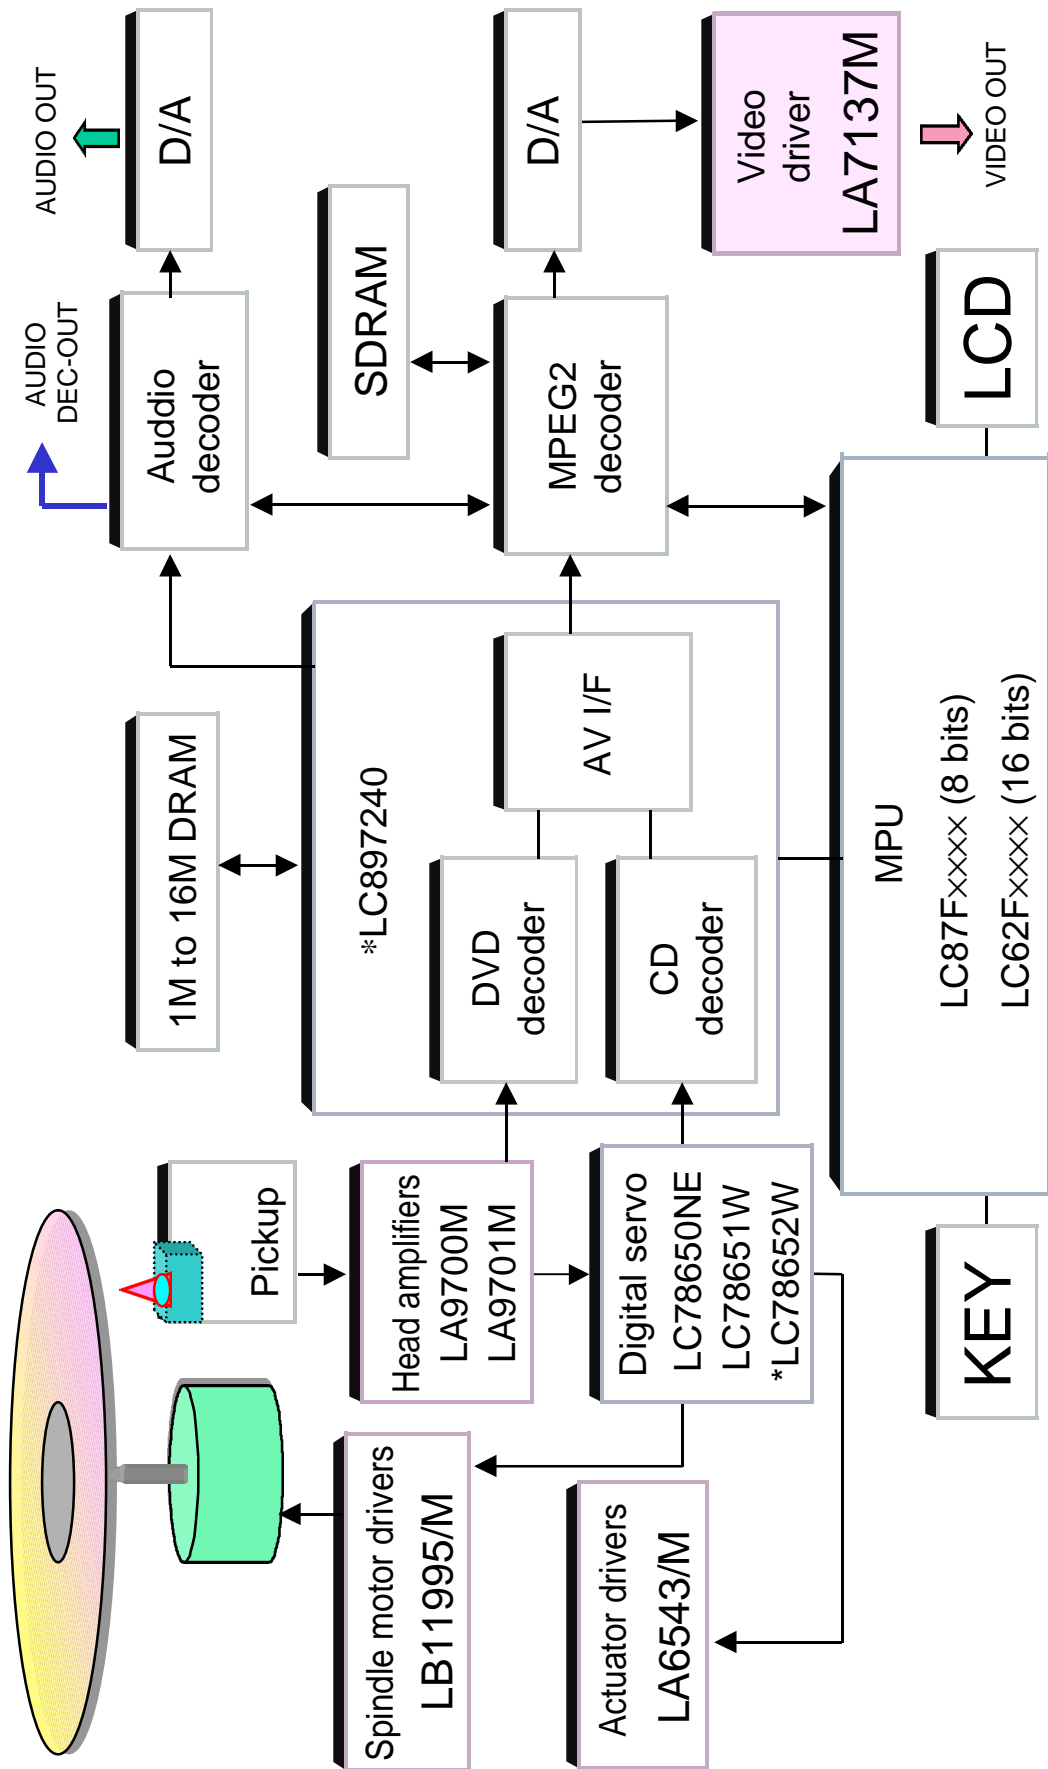

Single composite/S signal plus single component signal application using a single D/A converter

Application circuit diagram for end product that provides one output system each for composite/S and component outputs and the D/A converter output pin is shared between the S signal and the component signal systems. The muting control can be used to switch between the composite/S and component outputs.

The system microcontroller must be programmed to turn the Y/C mixer off when the component signal system is used.

## Test Circuit

Input Signal for Test

- Specifications of any and all SANYO Semiconductor products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Semiconductor Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor products (including technical data, services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written permission of SANYO Semiconductor Co., Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO Semiconductor product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only; it is not guaranteed for volume production. SANYO Semiconductor believes information herein is accurate and reliable, but no guarantees are made or implied regarding its use or any infringements of intellectual property rights or other rights of third parties.
