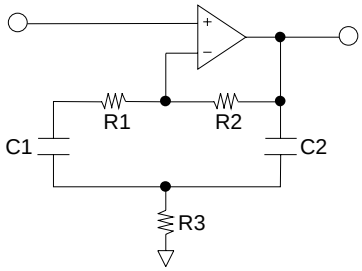
Calculation of External Equalizer Constant

Bass/Super Bass Circuit

The equivalent circuit and the formula for calculating the external RC with a mean frequency of 100 Hz are shown below.

- Bass/super bass band equivalent circuit block diagram



- Calculation example

  Specification Mean frequency: f0 = 100 Hz

  Gain during maximum boost: G = 10 dB

  Using R1 = 0, R2 = 33.097 kΩ, and C1 = C2 = C,

We obtain R2 from G = 10 dB.

$$G_{+10\,dB} = 20 \times LOG_{10}\left(1 + \frac{R2}{2R3}\right)$$

$$R3 = \frac{R2}{2\left(10^{G+10dB/20} - 1\right)} = \frac{33097}{2 \times (3.162 - 1)} \neq 7.6\ K\Omega$$

We obtain C from mean frequency f0 = 100 Hz.

$$f0 = \frac{1}{2\pi\sqrt{R3R2C1C2}}$$

$$C = \frac{1}{2\pi f0\sqrt{R3R2}} = \frac{1}{2\pi \times 100\sqrt{33097 \times 7600}} \neq 0.01\ \mu F$$

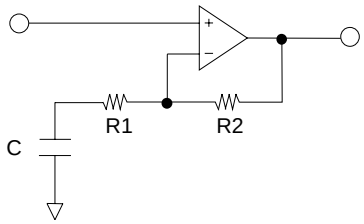
We obtain Q.

$$Q = \frac{R3R2}{2R3}\ \frac{1}{\sqrt{R3R2}} \neq 1.04$$

Treble Band Circuit

The shelving characteristics can be obtained for the treble band.

The equivalent circuit and calculation formula during boost are indicated below.



- Calculation example

  Specification Set frequency: f = 26000 Hz

  Gain during maximum boost: $G_{+10\ dB} = 10$ dB

  Using R1 = 16.240 kΩ and R2 = 35.461 kΩ, and inserting the above values in the following formula, we

$$G = 20 \times LOG_{10}\left(1 + \frac{R2}{\sqrt{R1^2 + (1/\omega C)^2}}\right)$$

$$C = \frac{1}{2\pi f\sqrt{(\frac{R2}{10^{G/20}-1})^2 - R1^2}}$$

$$= \frac{1}{2\pi 26000\sqrt{(\frac{35461}{3.16-1})^2 - 16240^2}} \neq 2700(pF)$$

Usage Cautions

- Upon power application, the internal analog switch status is undefined. Use an external countermeasure such as muting until data is set.
- When performing initial setting after applying power, send the initial setting data for the left and right channels prior to canceling mute.
- To ensure that the high-frequency digital signals sent to the CL, DI, and CE pins do not spill over to the analog signal block, either guard these signal lines with a ground pattern, or perform transmission using shielded wires.
