DATA SHEET

LC87F7032A

CMOS IC
FROM 32K byte, RAM 1024 byte on-chip
8-bit 1-chip Microcontroller

Overview

The LC87F7032A is an 8-bit single chip microcontroller with the following on-chip functional blocks:

- CPU: operable at a minimum bus cycle time of 250ns
- 32K bytes Flash ROM
- On-chip PAM: 1024 bytes
- LCD controller/driver
- 16bit timer × 2ch + 8bit timer × 1ch or more
- Synchronous serial I/O port (with automatic block transmit/receive function)
- Asynchronous/synchronous serial I/O port
- System clock divider
- 20-source 10-vectored interrupt system
- 8-bit AD converter × 9-channel
- On chip debugger

All of the above functions are fabricated on a single chip.

Features

■Flash ROM

- Block-erasable in 128byte units
- 32768 × 8 bits (LC87F7032A)

■RAM

- 1024 × 9-bits (LC87F7032A)

* This product is licensed from Silicon Storage Technology, Inc. (USA), and manufactured and sold by SANYO Semiconductor Co., Ltd.

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

SANYO Semiconductor Co., Ltd.

TOKYO OFFICE Tokyo Bldg., 1-10, 1 Chome, Ueno, Taito-ku, TOKYO, 110-8534 JAPAN

■ Minimum Bus Cycle Time

- 250ns (4MHz)

Note: Bus cycle time indicates the speed to read ROM.

■ Minimum Instruction Cycle Time (tCYC)

- 750ns (4MHz)

■ Ports

- Input/output ports

Data direction programmable for each bit individually 12 (P1n, P70 to P73)

Data direction programmable in nibble units 8 (P0n)

(When N-channel open drain output is selected, data can be input in bit units.)

Other function 3 (DBGP0, DBGP1, DBGP2)

- PWM input/output port1 (PWM)

- LCD ports

Segment output 24 (S00 to S23)

Common output 4 (COM0 to COM3)

Bias terminals for LCD driver 5 (V1 to V3, CUP1, CUP2)

Other functions

Input/output ports 8 (PCn)

- Oscillator pins 4 (CF1, CF2, XT1, XT2)

- Reset pin 1 (RES)

- Power supply 4 (V_{SS}1 to 2, V_{DD}1 to 2)

1 (VDC)

■ LCD Controller

- Seven display modes are available
- Duty 1/3duty, 1/4duty
- Bias 1/2bias, 1/3bias
- Segment output can be switched to general purpose input/output ports.

■ Timers

- Timer 0: 16-bit timer/counter with capture register

Mode 0: 2 channel 8-bit timer with programmable 8 bit prescaler and 8 bit capture register

Mode 1: 8 bit timer with 8 bit programmable prescaler and 8 bit capture register + 8 bit counter with 8-bit capture register

Mode 2: 16 bit timer with 8 bit programmable prescaler and 16 bit capture register

Mode 3: 16 bit counter with 16 bit capture register

- Timer1: PWM/16 bit timer/counter with toggle output function

Mode 0: 2 channel 8 bit timer/counter (with toggle output)

Mode 1: 2 channel 8 bit PWM

Mode 2: 16 bit timer/counter (with toggle output) toggle output from lower 8 bits is also possible.

Mode 3: 16 bit timer (with toggle output) lower order 8 bits can be used as PWM.

- Timer4: 8-bit timer with 6-bit prescaler

- Timer5: 8-bit timer with 6-bit prescaler

- Timer6: 8-bit timer with 6-bit prescaler (with toggle output)

- Timer7: 8-bit timer with 6-bit prescaler (with toggle output)

- Base Timer

1) The clock signal can be selected from any of the following:

Sub-clock (32.768kHz crystal oscillator), system clock, and prescaler output from timer 0

2) Interrupts of five different time intervals are possible.

LC87F7032A

■SIO

- SIO0: 8-bit synchronous serial interface
 - 1) LSB first/MSB first is selectable
 - 2) Internal 8 bit baud-rate generator (fastest clock period $4/3 t_{CYC}$)
 - 3) Consecutive automatic data communication (1 to 256 bits)
- SIO1: 8 bit asynchronous/synchronous serial interface
 - Mode 0: Synchronous 8 bit serial IO (2-wire or 3-wire, transmit clock 2 to 512 tCYC)
 - Mode 1: Asynchronous serial IO (half duplex, 8 data bits, 1 stop bit, baud rate 8 to 2048 tCYC)
 - Mode 2: Bus mode 1 (start bit, 8 data bits, transmit clock 2 to 512 tCYC)
 - Mode 3: Bus mode 2 (start detection, 8 data bits, stop detection)

■UART

- Full duplex
- 1 stop bit (2-bit in continuous data transmission)
- Built-in baudrate generator

■AD Converter

- 8-bit \times 9-channels

■PWM

- Multifrequency 12-bit PWM \times 1-channels

■Remote Control Receiver Circuit (sharing pins with P73, INT3, and T0IN)

- Noise rejection function (noise rejection filter's time constant can be selected from $1/32/128 t_{CYC}$)

■Watchdog Timer

- Watchdog timer can produce interrupt or system reset.
- Watchdog timer has two types.
 - Use an external RC circuit
 - Use the microcontroller's basetimer

■Clock Output Function

- 1) Able to output selected oscillation clock $1/1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64$ as system clock.
- 2) Able to output oscillation clock of sub clock.

■Interrupts

- 20 sources, 10 vector addresses
 - 1) Three priority (low, high and highest) multiple interrupts are supported. During interrupt handling, an equal or lower priority interrupt request is postponed.
 - 2) If interrupt requests to two or more vector addresses occur at once, the higher priority interrupt takes precedence. In the case of equal priority levels, the vector with the lowest address takes precedence.

No.	Vector Address	Level	Interrupt Source
1	00003H	X or L	INT0
2	0000BH	X or L	INT1
3	00013H	H or L	INT2/T0L
4	0001BH	H or L	INT3/base timer
5	00023H	H or L	T0H
6	0002BH	H or L	T1L/T1H
7	00033H	H or L	SIO0/UART1 receive
8	0003BH	H or L	SIO1/UART-send
9	00043H	H or L	ADC/T6/T7
10	0004BH	H or L	Port 0/T4/T5/PWM

- Priority levels $X > H > L$
- For equal priority levels, vector with lowest address takes precedence.

■Subroutine Stack Levels

- 512 levels maximum (the stack is allocated in RAM)

■High-speed Multiplication/Division Instructions

- 16-bits × 8-bits (5 tCYC execution time)
- 24-bits × 16-bits (12 tCYC execution time)
- 16-bits ÷ 8-bits (8 tCYC execution time)
- 24-bits ÷ 16-bits (12 tCYC execution time)

■Oscillation Circuits

- On-chip RC oscillation for system clock use.
- CF oscillation (4MHz) for system clock use. (Rf built in, Rd external)
- Crystal oscillation (32.768kHz) low speed system clock use. (Rf built in, Rd external)
- On-chip frequency variable RC oscillation circuit for system clock use.

■System Clock Divider Function

- Low power consumption operation is available
- Minimum instruction cycle time (750ns, 1.5μs, 3.0μs, 6.0μs, 12μs, 24μs, 48μs, 96μs, 192μs can be switched by program (when using 4MHz main clock)

■Standby Function

- HALT mode:

HALT mode is used to reduce power consumption. During the HALT mode, program execution is stopped but peripheral circuits keep operating (some parts of serial transfer operation stop.)

- 1) Oscillation circuits are not stopped automatically.
- 2) Released by the system reset or interrupts.

- HOLD mode

HOLD mode is used to reduce power consumption. Program execution and peripheral circuits are stopped.

- 1) CF, RC and crystal oscillation circuits stop automatically.
- 2) Released by any of the following conditions.
 - (1) Low level input to the reset pin
 - (2) Specified level input to one of INT0, INT1, INT2.
 - (3) Port 0 interrupt

- X'tal HOLD mode

X'tal HOLD mode is used to reduce power consumption. Program execution is stopped.

All peripheral circuits except the base timer are stopped.

- 1) CF and RC oscillation circuits stop automatically.
- 2) Crystal oscillator operation is kept in its state at HOLD mode inception.
- 3) Released by any of the following conditions
 - (1) Low level input to the reset pin
 - (2) Specified level input to one of INT0, INT1, INT2.
 - (3) Port 0 interrupt
 - (4) Base-timer interrupt

■ROM Correct Function

- ROM correct program is executed by checking the program counter.
- ROM correct program area: 128byte

■On-chip Debugger Function

- Software debug is available on the target board.

■Package Form

- TQFP64J(7×7) :Lead-free type
- QIP64E(14×14) :Lead-free type

LC87F7032A

Port Output Configuration

Port form and pull-up resistor options are shown in the following table.

Port status can be read even when port is set to output mode.

Terminal	Option applies to:	Options	Output Form	Pull-up resistor
P00 to P07	each bit	1	CMOS	Programmable (Note 1)
		2	Nch-open drain	None
P10 to P17	each bit	1	CMOS	Programmable
		2	Nch-open drain	Programmable
P70	-	None	Nch-open drain	Programmable
P71 to P73	-	None	CMOS	Programmable
S16(PC0) to S23(PC7)	each bit	1	CMOS	None
		2	P-ch Open Drain	
		3	N-ch Open Drain	

Note 1: Attachment of Port0 programmable pull-up resistors is controllable in nibble units (P00 to 03, P04 to 07).

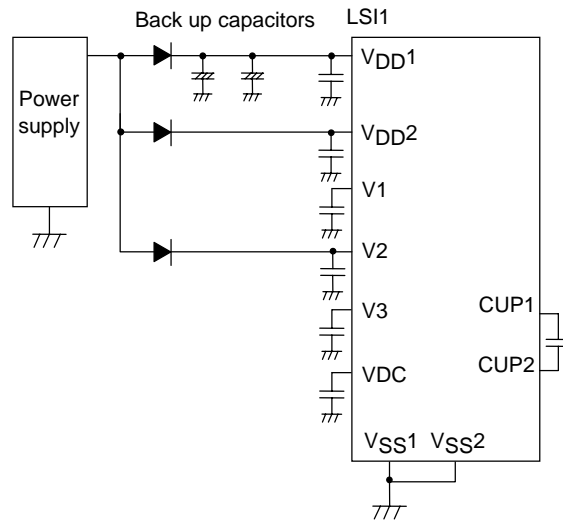

* 1: Connect as follows to reduce noise on VDD.

VSS1 and VSS2 must be connected together and grounded.

* 2: The power supply for the internal memory is VDD1. VDD1 and VDD2 are used as the power supply for ports.

When VDD1 and VDD2 are not backed up, the port level does not become “H” even if the port latch is in the “H” level. Therefore, when VDD1 and VDD2 are not backed up and the port latch is “H” level, the port level is unstable in the HOLD mode, and the back up time becomes shorter because the through current runs from VDD to GND in the input buffer.

If VDD1 and VDD2 are not backed up, output “L” by the program or pull the port to “L” by the external circuit in the HOLD mode so that the port level becomes “L” level and unnecessary current consumption is prevented.

LC87F7032A

Absolute Maximum Ratings at Ta = 25°C, VSS1 = VSS2 = 0V

Parameter	Symbol	Pins	Conditions	Specification				unit
				VDD[V]	min	typ	max

Example of 8-bit Data Reception Mode Processing (Receive Data=55H)

Main System Clock Oscillation Circuit Characteristics

The characteristics in the table below is based on the following conditions:

Use the standard evaluation board SANYO has provided.

Use the peripheral parts with indicated value externally.

The peripheral parts value is a recommended value of oscillator manufacturer

Table 1. Main system clock oscillation circuit characteristics using ceramic resonator

Frequency	Manufacturer	Type	Oscillator	Circuit parameters			Operating supply voltage range [V]	Oscillation stabilizing time		Notes
				C1 [pF]	C2 [pF]	Rd1 [Ω]		typ [ms]	max [ms]	
4.00MHz	Murata	SMD	CSTCR4M00G53-R0	(15)	(15)	1k	2.4 to 3.6	0.2	0.6	Built in C1, C2
		Lead	CSTLS4M00G53-B0	(15)	(15)	2.2k	2.4 to 3.6	0.2	0.6	

The oscillation stabilizing time is a period until the oscillation becomes stable after V_{DD} becomes higher than minimum operating voltage. (See Fig. 4.)

Subsystem Clock Oscillator Circuit Characteristics

The characteristics in the table below is based on the following conditions:

Use the standard evaluation board SANYO has provided.

Use the peripheral parts with indicated value externally.

The peripheral parts value is a recommended value of oscillator manufacturer

Table 2 Subsystem Clock Oscillation Circuit Characteristics Using Crystal Oscillator

Frequency	Manufacturer	Oscillator	Circuit Constant				Operating supply voltage range [V]	Oscillation Stabilization Time		Notes
			C3 [pF]	C4 [pF]	Rf [Ω]	Rd2 [Ω]		typ [s]	max [s]	
32.768kHz	Epson Toyocom	MC-146	3	3	Open	0	2.4 to 3.6	1	3	Applicable CL value=7.0pF

The oscillation stabilizing time is a period until the oscillation becomes stable after executing the instruction which starts the sub-clock oscillation or after releasing the HOLD mode. (See Fig. 4.)

Note: Since the circuit pattern affects the oscillation frequency, place the oscillation-related parts as close to the oscillation pins as possible with the shortest possible pattern length.
