

# LC87F72C8A

## 8-Bit Single Chip Microcontroller with 128 KB Flash Memory and 2048-Byte RAM On Chip

### Preliminary

#### Overview

The LC87F72C8A is an 8 bit single chip microcontroller with the following on-chip functional blocks :

- CPU: operable at a minimum bus cycle time of 100 ns
- 128K bytes flash ROM (on-board rewritable)
- On-chip RAM: 2048 bytes
- LCD controller / driver
- 16 bit timer / counter (can be divided into two 8 bit timers)
- 16 bit timer / PWM (can be divided into two 8 bit timers)
- Timer for use as date / time clock
- Synchronous serial I/O port (with automatic block transmit / receive function)
- Asynchronous / synchronous serial I/O port
- 12-channel × 8-bit AD converter
- Small signal detector
- 14-source 10-vectored interrupt system

All of the above functions are fabricated on a single chip.

#### Features

##### (1) Flash ROM

- Single 5V power supply, on-board writable
- Block erase in 128 byte units
- 131072 × bits (LC87F72C8A)

##### (2) Random Access Memory (RAM): 2048 × 9 bits (LC87F72C8A)

- Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.
- SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

(3) Minimum Bus Cycle Time: 100 ns (10 MHz)

Note: The bus cycle time indicates ROM read time.

(4) Minimum Instruction Cycle Time: 300 ns (10MHz)

(5) Ports

- Input/output ports
  - Data direction programmable for each bit individually : 26 (P1n, P30-P35, P70-P73, P8n)
  - Data direction programmable in nibble units : 8 (P0n)
  - (When N-channel open drain output is selected, data can be input in bit units.)
- Input ports : 2 (XT1,XT2)
- LCD ports
  - Segment output : 48 (S00-S47)
  - Common output : 4 (COM0-COM3)
  - Bias terminals for LCD driver 3 (V1-V3)
- Other functions
  - Input/output ports : 48(PAn,PBn,PCn,PDn,PEn,PFn)
  - Input ports : 7 (PLn)
- Oscillator pins : 2 (CF1,CF2)
- Reset pin : 1 (RES)
- Power supply : 6 (VSS1-3,VDD1-3)

(6) LCD controller

- Seven display modes are available (static, 1/2, 1/3, 1/4 duty × 1/2, 1/3 bias)
- Segment output and common output can be switched to general purpose input/output ports.

(7) Small signal detection (MIC signals etc)

- Counts pulses with the level which is greater than a preset value
- 2 bit counter

(8) Timers

- Timer 0: 16 bit timer / counter with capture register
  - Mode 0: 2 channel 8-bit timer with programmable 8 bit prescaler and 8 bit capture register
  - Mode 1: 8 bit timer with 8 bit programmable prescaler and 8 bit capture register + 8 bit Counter with 8-bit capture register
  - Mode 2: 16 bit timer with 8 bit programmable prescaler and 16 bit capture register
  - Mode 3: 16 bit counter with 16 bit capture register
- Timer 1: PWM / 16 bit timer with toggle output function
  - Mode 0: 2 channel 8 bit timer (with toggle output)
  - Mode 1: 2 channel 8 bit PWM
  - Mode 2: 16 bit timer (with toggle output) Toggle output from lower 8 bits is also possible.
  - Mode 3: 16 bit timer (with toggle output) Lower order 8 bits can be used as PWM.
- Base Timer
  - 1) The clock signal can be selected from any of the following :
    - Sub-clock (32.768kHz crystal oscillator), system clock, and prescaler output from timer 0
  - 2) Interrupts of five different time intervals are possible.

(9) Serial-interface

- SIO 0: 8 bit synchronous serial interface
  - 1) LSB first / MSB first is selectable
  - 2) Internal 8 bit baud-rate generator (fastest clock period 4 / 3 Tcyc)
  - 3) Consecutive automatic data communication (1-256 bits)
- SIO 1: 8 bit asynchronous / synchronous serial interface
  - Mode 0: Synchronous 8 bit serial IO (2-wire or 3-wire, transmit clock 2–512 Tcyc)
  - Mode 1: Asynchronous serial IO (half duplex, 8 data bits, 1 stop bit, baud rate 8–2048Tcyc)
  - Mode 2: Bus mode 1 (start bit, 8 data bits, transmit clock 2–512 Tcyc)
  - Mode 3: Bus mode 2 (start detection, 8 data bits, stop detection)

(10) AD converter

- 8 bits × 12 channels

(11) Remote control receiver circuit (connected to P73 / INT3 / T0IN terminal)

- Noise rejection function (noise rejection filter's time constant can be selected from 1 / 32 / 128 Tcyc)

(12) Watchdog timer

- The watching time period is determined by an external RC.
- Watchdog timer can produce interrupt or system reset

(13) Interrupts: 14 sources, 10 vectors

- 1) Three priority (low, high and highest) multiple interrupts are supported. During interrupt handling, an equal or lower priority interrupt request is postponed.
- 2) If interrupt requests to two or more vector addresses occur at once, the higher priority interrupt takes precedence. In the case of equal priority levels, the vector with the lowest address takes precedence.

No.	Vector	Selectable Level	Interrupt signal
1	00003H	X or L	INT0
2	0000BH	X or L	INT1
3	00013H	H or L	INT2/T0L
4	0001BH	H or L	INT3/Base timer
5	00023H	H or L	T0H
6	0002BH	H or L	T1L/T1H
7	00033H	H or L	SIO0
8	0003BH	H or L	SIO1
9	00043H	H or L	ADC/MIC
10	0004BH	H or L	Port 0

- Priority Level: X>H>L
- For equal priority levels, vector with lowest address takes precedence.

(14) Subroutine stack levels: 1024 levels max. Stack is located in RAM.

(15) Multiplication and division

- 16 bit × 8 bit (executed in 5 cycles)
- 24 bit × 16 bit (12 cycles)
- 16 bit ÷ 8 bit (8 cycles)
- 24 bit ÷ 16 bit (12 cycles)

(16) Oscillation circuits

- On-chip RC oscillation for system clock use.
- CF oscillation for system clock use. (Rf built in, Rd external)
- Crystal oscillation low speed system clock use. (Rf built in, Rd external)

(17) Standby function

- HALT mode

HALT mode is used to reduce power consumption. During the HALT mode, program execution is stopped but peripheral circuits keep operating (some parts of serial transfer operation stop.)

- 1) Oscillation circuits are not stopped automatically.
- 2) Released by the system reset or interrupts.

-HOLD mode

HOLD mode is used to reduce power consumption. Program execution and peripheral circuits are stopped.

- 1) CF, RC and crystal oscillation circuits stop automatically.
- 2) Released by any of the following conditions.
  1. Low level input to the reset pin
  2. Specified level input to one of INT0, INT1, INT2
  3. Port 0 interrupt

-X'tal HOLD mode

X'tal HOLD mode is used to reduce power consumption. Program execution is stopped.

All peripheral circuits except the base timer are stopped.

- 1) CF and RC oscillation circuits stop automatically.
- 2) Crystal oscillator operation is kept in its state at HOLD mode inception.
- 3) Released by any of the following conditions
  1. Low level input to the reset pin
  2. Specified level input to one of INT0, INT1, INT2
  3. Port 0 interrupt
  4. Base-timer interrupt

(18) Package

- QIP100E
- SQFP100

(19) Development tools

- Evaluation chip: LC876096
- Emulator: EVA62S + ECB876500 (Evaluation chip board) + SUB877200 + POD100QFP or POD100SQFP (Type B)

(20) Same package and pin assignment as mask ROM version.

- 1) LC877200 series options can be set using flash ROM data. Thus the board used for mass production can be used for debugging and evaluation without modifications.
- 2) If the program for the mask ROM version is used, the usable ROM/RAM capacity is the same as the mask ROM version.

CF1	I	Input terminal for ceramic oscillator	No
CF2	O	Output terminal for ceramic oscillator	No

## Port Configuration

Port form and pull-up resistor options are shown in the following table.  
 Port status can be read even when port is set to output mode.

Terminal	Option applies to:	Options	Output Form	Pull-up resistor
P00 to P07	each bit	1	CMOS	Programmable (Note 1)
		2	Nch-open drain	None
P10 to P17	each bit	1	CMOS	Programmable
		2	Nch-open drain	Programmable
P30 to P35	each bit	1	CMOS	Programmable
		2	Nch-open drain	None
P70	–	None	Nch-open drain	Programmable
P71 to P73	–	None	CMOS	Programmable
P80 to P87	–	None	Nch-open drain	None
S0/PA0 to S47/PF7	–	None	CMOS	Programmable
COM0/PL0 to COM3/PL3	–	None	Input only	None
V1/PL4 to V3/PL6	–	None	Input only	None
XT1	–	None	Input only	None
XT2	–	None	Output for 32.768kHz crystal oscillation	None

Note 1 Attachment of Port0 programmable pull-up resistors is controllable in nibble units (P00-03, P04-07).

\* Note 1: Connect as follows to reduce noise on VDD.

VSS1, VSS2 and VSS3 must be connected together and grounded.

\*Note 2 : The power supply for the internal memory is VDD1 but it uses the VDD2 as the power supply for ports. When the VDD2 is not backed up, the port level does not become “H” even if the port latch is in the “H” level. Therefore, when the VDD2 is not backed up and the port latch is “H” level, the port level is unstable in the HOLD mode, and the back up time becomes shorter because the through current runs from VDD to GND in the input buffer. If VDD2 is not backed up, output “L” by the program or pull the port to “L” by the external circuit in the HOLD mode so that the port level becomes “L” level and unnecessary current consumption is prevented.

Main system clock oscillation circuit characteristics

The characteristics in the table below is based on the following conditions:

1. Use the standard evaluation board SANYO has provided.
2. Use the peripheral parts with indicated value externally.
3. The peripheral parts value is a recommended value of oscillator manufacturer

Table 1. Main system clock oscillation circuit characteristics using ceramic resonator

Frequency	Manufacturer	Oscillator	Circuit parameters			Operating supply voltage range	Oscillation stabilizing time		Notes
			C1	C2	Rd1		typ	max	
10MHz	Murata	CSA10.0MTZ	33pF	33pF	470Ω	4.5 – 5.5V	0.09ms	0.4ms	
		CST10.0MTW	(30pF)	(30pF)	470Ω	4.5 – 5.5V	0.09ms	0.4ms	Built in C1,C2
4MHz	Murata	CSA4.00MG	33pF	33pF	680Ω	3.0 – 5.5V	0.07ms	0.2ms	
		CST4.00MGW	(30pF)	(30pF)	680Ω	3.0 – 5.5V	0.07ms	0.2ms	Built in C1,C2

The oscillation stabilizing time is a period until the oscillation becomes stable after VDD becomes higher than minimum operating voltage. (Refer to Figure4)

Subsystem clock oscillation circuit characteristics

The characteristics in the table below is based on the following conditions:

1. Use the standard evaluation board SANYO has provided.
2. Use the peripheral parts with indicated value externally.
3. The peripheral parts value is a recommended value of oscillator manufacturer

Table 2. Subsystem clock oscillation circuit characteristics using crystal oscillator

Frequency	Manufacturer	Oscillator	Circuit parameters				Operating supply voltage range	Oscillation stabilizing time		Notes
			C3	C4	Rf	Rd2		typ	max	
32.768MHz	Seiko EPSON	C-002RX	18pF	18pF	OPEN	390kΩ	3.0 – 5.5V	1.0s	3.0s	
		MC-306								

The oscillation stabilizing time is a period until the oscillation becomes stable after executing the instruction which starts the sub-clock oscillation or after releasing the HOLD mode. (Refer to Figure4)

(Notes) • Since the circuit pattern affects the oscillation frequency, place the oscillation-related parts as close to the oscillation pins as possible with the shortest possible pattern length.

Figure 1 Ceramic oscillation circuit

Figure 2 Crystal oscillation circuit

Figure 3 AC timing measurement point

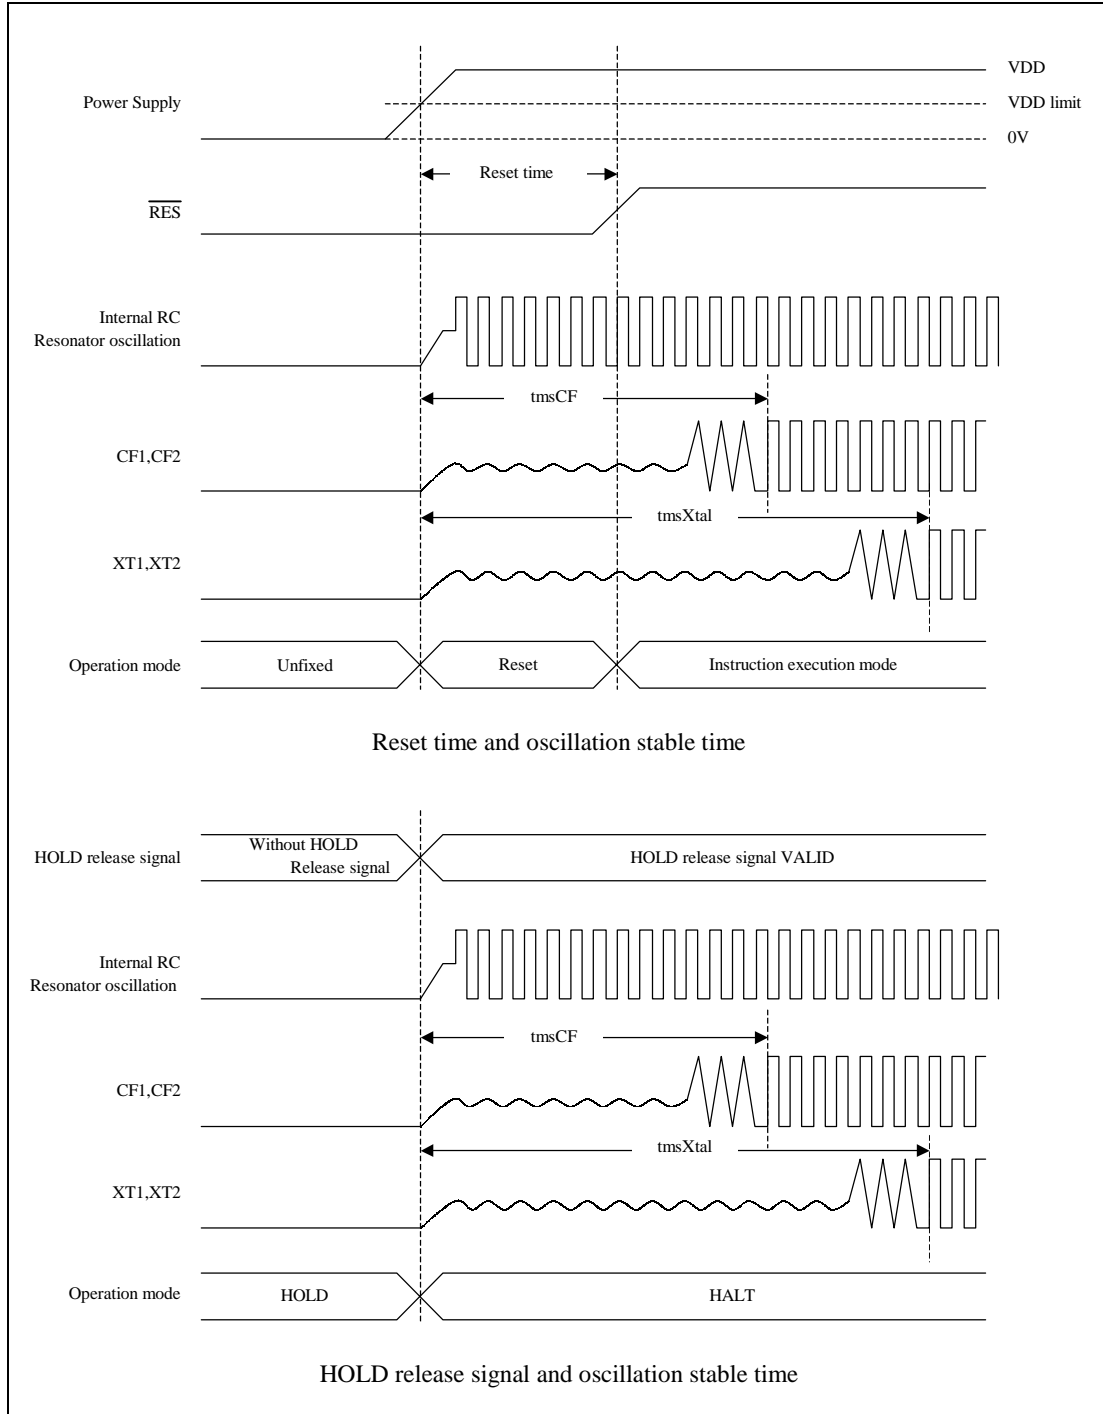

Figure 4 Oscillation stabilizing time

(Note)  
 Select CRES and RRES value to assure that at least 200 $\mu$ s reset time is generated after the VDD becomes higher than the minimum operating voltage.

- Specifications of any and all SANYO products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Electric Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO products (including technical data, services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
