

Features

- Single voltage supply operation
- $\pm 3.5g$ full-scale
- Output voltage, offset and sensitivity are ratiometric to the supply voltage
- Factory trimmed device sensitivity and offset
- Embedded self test
- RoHS/ECOPACK® compliant
- High shock survivability (10000g)

Description

The LIS344AL is an ultra compact consumer low-power three-axis linear accelerometer that includes a sensing element and an IC interface able to take the information from the sensing element and to provide an analog signal to the external world.

The sensing element, capable of detecting the acceleration, is manufactured using a dedicated process developed by ST to produce inertial sensors and actuators in silicon.

The IC interface is manufactured using a CMOS process that allows high level of integration to design a dedicated circuit which is trimmed to better match the sensing element characteristics.

The LIS344AL is capable of measuring accelerations over a maximum bandwidth of 2.0kHz. The device bandwidth may be reduced by using external capacitances. A self-test capability allows the user to check the functioning of the system.

The LIS344AL is available in Land Grid Array package (LGA) and it is guaranteed to operate over an extended temperature range of -40°C to $+85^{\circ}\text{C}$.

The LIS344AL belongs to a family of products suitable for a variety of applications:

- Mobile terminals
- Gaming and virtual reality input devices
- Antitheft systems and inertial navigation
- Appliance and robotics.

Table 1. Device summary

Order code	Temp range, °C	Package	Packing

2 Mechanical and electrical specifications

2.1 Mechanical characteristics

www.datasheet4u.com

All the parameters are specified @ Vdd =3.0 V, T = 25°C unless otherwise noted

Table 3. Mechanical characteristics⁽¹⁾

Symbol	Parameter	Test condition	Min.	Typ. ⁽²⁾	Max.	Unit
Ar	Acceleration range ⁽³⁾			±3.5		g
So	Sensitivity ⁽⁵⁾		0.100*Vdd - 10%	0.100*Vdd	0.100*Vdd+ 10%	V/g
SoDr	Sensitivity change vs temperature	Delta from +25°C		0.01		%/°C
Voff	Zero-g level ⁽⁴⁾	T = 25°C	Vdd/2-15%	Vdd/2	Vdd/2+15%	V
OffDr	Zero-g level change vs temperature	Delta from +25°C		±0.7		mg/°C
NL	Non linearity ⁽⁵⁾	Best fit straight line		±0.6		% FS
CrossAx	Cross-axis ⁽⁶⁾			±2		%
An	Acceleration noise density	Vdd=3.0 V		275		µg/√Hz
Vt	Self test output voltage change ⁽⁷⁾	T = 25°C Vdd=3.0 V X axis		84		mV
		T = 25°C Vdd=3.0 V Y axis		84		mV
		T = 25°C Vdd=3.0 V Z axis		-84		mV
Fres	Sensing element resonant frequency ⁽⁸⁾	X, Y, Z axis	2.0			KHz
Top	Operating temperature range		-40		+85	°C
Wh	Product weight			0.040		gram

1. The product is factory calibrated at 3.0 V. The operational power supply range is from 2.7 V to 3.3 V. Voff, So and Vt parameters will vary with supply voltage.
2. Typical specifications are not guaranteed.
3. Guaranteed by wafer level test and measurement of initial offset and sensitivity.
4. Zero-g level and sensitivity are essentially ratiometric to supply voltage at the calibration level ±8%.
5. Guaranteed by design.
6. Contribution to the measuring output of an inclination/acceleration along any perpendicular axis.
7. "Self test output voltage change" is defined as $V_{out}(V_{st=Logic1}) - V_{out}(V_{st=Logic0})$.
8. Minimum resonance frequency Fres=2.0 KHz. Sensor bandwidth= $1/(2*\pi*32\text{ k}\Omega*C_{load})$, with Cload>2.5 nF.

2.2 Electrical characteristics

Table 4. Electrical characteristics⁽¹⁾

Symbol	Parameter	Test condition	Min.	Typ. ⁽²⁾	Max.	Unit
Vdd	Supply voltage		2.7	3.0	3.3	V
Idd	Supply current			0.69		mA
Vst	Self Test Input	Logic 0 level	0		0.8	V
		Logic 1 level	2.0		Vdd	V
Rout	Output impedance of VoutX, VoutY, VoutZ			32		KΩ
Cload	Capacitive load drive ⁽³⁾ for VoutX, VoutY, VoutZ		2.5			nF

1. The product is factory calibrated at 3.0 V.
2. Typical specifications are not guaranteed.
3. Minimum resonance frequency $F_{res}=2$ KHz. Device bandwidth= $1/(2*\pi*32\text{ k}\Omega*Cload)$, with $Cload>2.5$ nF.

2.3 Absolute maximum ratings

Stresses above those listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 6	V
Vin	Input voltage on any control pin (ST)	-0.3 to Vdd +0.3	V
A _{POW}	Acceleration (any axis, powered, Vdd=3.0 V)	3000g for 0.5 ms	
		10000g for 0.1 ms	
A _{UNP}	Acceleration (any axis, not powered)	3000g for 0.5 ms	
		10000g for 0.1 ms	
T _{STG}	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection	2 (HBM)	KV
		1.5 (CDM)	KV
		200 (MM)	V

2.4 Terminology

Sensitivity describes the gain of the sensor and can be determined by applying 1g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the Earth, note the output value, rotate the sensor by 180 degrees (point to the sky) and note the output value again thus applying $\pm 1g$ acceleration to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, will give the actual sensitivity of the sensor. This value changes very little over temperature (see sensitivity change vs. temperature) and also very little over time. The Sensitivity tolerance describes the range of Sensitivities of a large population of sensors.

Zero-g level describes the actual output signal if there is no acceleration present. A sensor in a steady state on a horizontal surface will measure 0g in X axis and 0g in Y axis whereas the Z axis will measure 1g. The output is ideally for a 3.0V powered sensor $V_{dd}/2 = 1500$ mV. A deviation from ideal 0-g level (1500 mV in this case) is called Zero-g offset. Offset of precise MEMS sensors is to some extent a result of stress to the sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature - see "Zero-g level change vs. temperature" - the Zero-g level of an individual sensor is very stable over lifetime. The Zero-g level tolerance describes the range of Zero-g levels of a population of sensors.

Self test allows to test the mechanical and electric part of the sensor, allowing the seismic mass to be moved by means of an electrostatic test-force. The Self Test function is off when the ST pin is connected to GND. When the ST pin is tied at Vdd an actuation force is applied to the sensor, simulating a definite input acceleration. In this case the sensor outputs will exhibit a voltage change in their DC levels which is depending on the Supply Voltage through the device sensitivity. When ST is activated, the device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force. If the output signals change within the amplitude specified inside [Table 3](#), then the sensor is working properly and the parameters of the interface chip are within the defined specification.

Output impedance describes the resistor inside the output stage of each channel. This resistor is part of a filter consisting of an external capacitor of at least 2.5 nF and the internal resistor. Due to the resistor level, only small inexpensive external capacitors are needed to generate low corner frequencies. When interfacing with an ADC it is important to use high input impedance input circuitries to avoid measurement errors. Note that the minimum load capacitance forms a corner frequency close to the resonance frequency of the sensor. In general the smallest possible bandwidth for a particular application should be chosen to get the best results.

3 Functionality

www.datasheet4u.com

The LIS344AL is an ultra compact low-power, analog output three-axis linear accelerometer packaged in a LGA package. The complete device includes a sensing element and an IC interface able to take the information from the sensing element and to provide an analog signal to the external world.

3.1 Sensing element

A proprietary process is used to create a surface micro-machined accelerometer. The technology allows to carry out suspended silicon structures which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. To be compatible with the traditional packaging techniques a cap is placed on top of the sensing element to avoid blocking the moving parts during the moulding phase of the plastic encapsulation.

When an acceleration is applied to the sensor the proof mass displaces from its nominal position, causing an imbalance in the capacitive half-bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the sense capacitor.

At steady state the nominal value of the capacitors are few pF and when an acceleration is applied the maximum variation of the capacitive load is in fF range.

3.2 IC Interface

The complete signal processing uses a fully differential structure, while the final stage converts the differential signal into a single-ended one to be compatible with the external world.

The first stage is a low-noise capacitive amplifier that implements a Correlated Double Sampling (CDS) at its output to cancel the offset and the $1/f$ noise. The produced signal is then sent to three different S&Hs, one for each channel, and made available to the outside.

All the analog parameters (output offset voltage and sensitivity) are ratiometric to the voltage supply. Increasing or decreasing the voltage supply, the sensitivity and the offset will increase or decrease linearly. The feature provides the cancellation of the error related to the voltage supply along an analog to digital conversion chain.

3.3 Factory calibration

The IC interface is factory calibrated for sensitivity (S_0) and Zero-g level (V_{off}). The trimming values are stored inside the device by a non volatile structure. Any time the device is turned on, the trimming parameters are downloaded into the registers to be employed during the normal operation. This allows the user to employ the device without further calibration.

4 Application hints

www.datasheet4u.com

Figure 3. LIS344AL electrical connection

Power supply decoupling capacitors (100 nF ceramic or polyester + 10 µF Aluminum) should be placed as near as possible to the device (common design practice).

The LIS344AL allows to band limit VoutX, VoutY and VoutZ through the use of external capacitors. The recommended frequency range spans from DC up to 2.0 kHz. In particular, capacitors are added at output VoutX, VoutY, VoutZ pins to implement low-pass filtering for antialiasing and noise reduction. The equation for the cut-off frequency (f_t) of the external filters is in this case:

$$f_t = \frac{1}{2\pi \cdot R_{out} \cdot C_{load}(x, y, z)}$$

Taking into account that the internal filtering resistor (R_{out}) has a nominal value equal to 32 kΩ, the equation for the external filter cut-off frequency may be simplified as follows:

$$f_t = \frac{5\mu F}{C_{load}(x, y, z)} [Hz]$$

The tolerance of the internal resistor can vary typically of ±20% within its nominal value of 32 kΩ, thus the cut-off frequency will vary accordingly. A minimum capacitance of 2.5 nF for $C_{load}(x, y, z)$ is required.

Table 6. Filter capacitor selection, $C_{load}(x,y,z)$,

Cut-off frequency	Capacitor value
1 Hz	5 μ F
10 Hz	0.5 μ F
20 Hz	250 nF
50 Hz	100 nF
100 Hz	50 nF
200 Hz	25 nF
500 Hz	10 nF

4.1 Soldering information

The LGA package is compliant with the ECOPACK, RoHs and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020C.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com/mems.

4.2 Output response vs. orientation

Figure 4. Output response vs. orientation

Figure 4 shows output voltage values of LIS344AL when powered at 3.0 V.

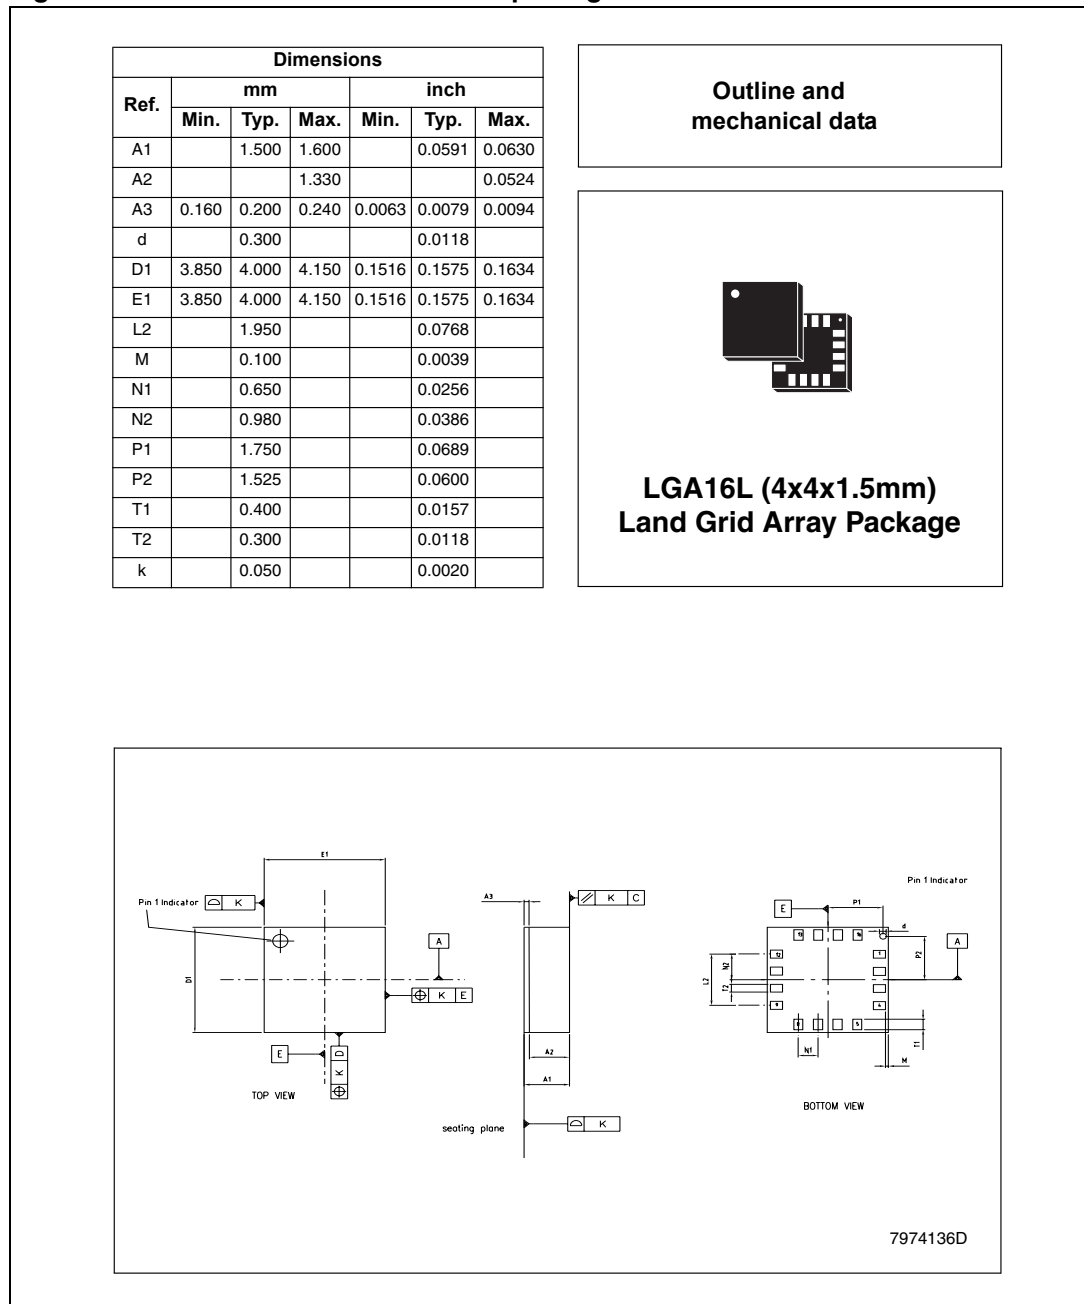

5 Package Information

www.datasheet4u.com

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark.

ECOPACK specifications are available at: www.st.com.
