DEVICE SPECIFICATION for
 Passive Matrix COLOR LCD Unit
 (840x480 dots)

Model No,
LM64C21P

CUSTOMER'S APPROVAL

 SHARP CORPORATION

1. Application

This data sheet is to introduce the specification of LM64C21P, Passive Matrix type Color LCD Module,

2. Construction and Outline

Construction: 640x480 dots color display module consisting of an LCD panel, PWB (printed wiring board) with electric components mounted onto, TAB (tape automated bonding) to connect the LCD panel and PWB electrically, and plastic chassis with CCFT back light and bezel to fix them mechanically, Signal ground (VSS) is connected with the metal bezel, DC/DC converter is built in,

Outline : See Fig. 10

Connection : See Fig. 10 and Table 8

3, Mechanical Specifications

Table 1

Parameter	Specifications	Unit
Outline dimensions	216,0(W) x152.4 (H) x 8.0 MAX(D)	mm
Active area	163, 175(W) x122,375(H)	mm
Viewing area	168.8 (W) x 128 (H)	
Display format	640 (W) x480 (H) full dots	-
Dot size	0.085x RGB (W) x 0.255 (H)	mm
Dot spacing	0.025	mm
#1 Base color	Normally black #2	-
Weight	Approx. 280	g

#1 Due to the characteristics of the LC material, the colors vary with environmental temperature,

#2 Negative-type display

Display data ‘H’ : ON → transmission

Display data ‘L’ : OFF → light isolation

4. Absolute Maximum Ratings

4-1 Electrical absolute maximum ratings

Table 2

Parameter	Symbol	MIN.	MAX.	Unit	Remark
Supply voltage (Logic)	V _{DD} -V _{SS}	0	6.0	V	T _a =25 °C
Input voltage	V _{IN}	-0.3	V _{DD}	V	T _a =25 °C

4-2 Environmental Conditions

Table 3

Item	Tstg		Topr		Remark
	MIN.	MAX.	MIN.	MAX.	
Ambient temperatuer	-25 “c	+80 “c	0 °C	+40 “c	Note 4]
Humidity	Note 1]		Note 1)		No condensation
Vibration	Note 2)		Note 2)		3 directions (X/Y/Z]
Shock	Note 3)		Note 3)		6 directions (±X±Y±Z]

Note 1) $T_a \leq 40 \text{ °C}$ 95%RH Max

$T_a > 40 \text{ °C}$ Absolute humidity shall be less than $T_a=40 \text{ °C}/95 \text{ %RH}$.

Note 2)

Table 4

Frequency	10 Hz~57 Hz	57 Hz 500 Hz]
Vibration level	-	9.8 m/s ²
Vibration width	0.075 mm	-
Interval	10 Hz~500 Hz~10 Hz/11,0 min	

2 hours for each direction of X/Y/Z (8 hours as total)

Note 3) Accerelation: 490 m/s²

Pulse width : 11ms

3 times for each direction of ±X/±Y/±Z

Note 4) Care should be taken so that the LCD module may not be subjected to the temperature out of this specification,

5. Electrical Specifications

5-1 Electrical characteristics

Table 5

Ta=25 °C, VDD=5.0V±0.5V

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Supply voltage (Logic)	VDD-VSS	Note 1)	4.5	5.0	5.5	v
Contrast adjust voltage	VCON-VSS	Ta=0 °C	0.80	—	—	V
		Ta=25 °C	1.35	1.95	2.55	v
		Ta=40 °C			2.80	
Input signal voltage	VIN	'H' level	0.8VDD	—	VDD+0.3	v
		'L' level	0	—	0.2VDD	v
Input leakage current	IIL	'H' level			100	μA
		'L*' level	-100	—	—	μA
Supply current (Logic)	IDD	Note 2)	—	110	170	mA
Rush current (Logic)	Irush	Ta=25 °C, Power ON	2 A (pk) × 20 ms + 1 A (pk) × 10 μs max			
Power consumption	Pd	Note 2]	—	500	850	mW

Note 1 Under the following conditions, ;

- ①Immediately after the rise of DISP signal, : 2 A×20 ms
- ②Under the situation that DISP signal is on and kept steady. : 1 A×10 μs

Note 2) Under the following conditions, ;

Vcon-Vss : contrast max. (1.95 V TYP)

VDD-Vss=5.0 V, Frame frequency=73 Hz, Display pattern = black/white stripe pattern

This value is direct current,

5-3 Interface signals

Fig. 2 Data input timing chart

Table. 7 Interface timing ratings ($T_a=0\sim 40\text{ }^{\circ}\text{C}$, $V_{DD}=5.0\text{ V}\pm 0.5\text{ V}$)

Item	Symbol	Rating			Unit
		MIN.	TYP.	MAX.	
Frame cycle #1	t_{FRM}	7.69		16.94	ms
YD signal *H* level set up time	t_{HYS}	100			ns
H level hold time	t_{HYH}	100			ns
L level set up time	t_{LYS}	100			ns
L level hold time	t_{LYH}	40			ns
LP signal *H* level pulse width	t_{WLPH}	200			ns
LP signal clock cycle #3	t_{LP}	10		70	us
XCK signal clock cycle	t_{CK}	70			ns
H level clock width	t_{WCKH}	25			ns
L level clock width	t_{WCKL}	25			ns
Data set up time	t_{DS}	25	5		ns
hold time	t_{DH}	25			ns
LP \uparrow allowance time from XCK \downarrow	t_{LS}	200			ns
XCK \uparrow allowance time from LP \downarrow	t_{LH}	200			ns
Input signal rise/fall time	t_r, t_f			#2	ns

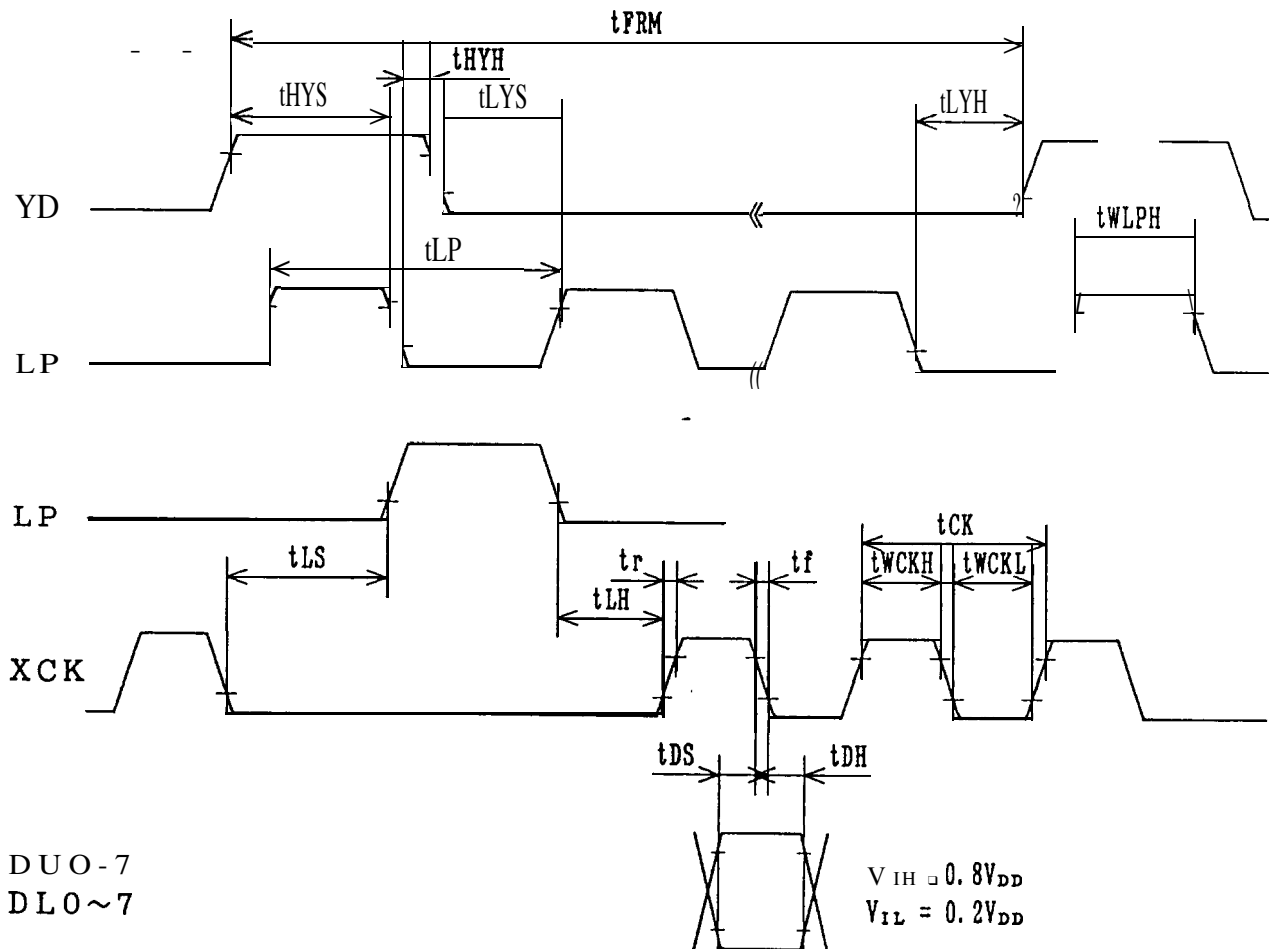

Fig. 3 Interface timing chart

- *1 LCD unit functions at the minimum frame cycle of 7.80 ms (Maximum frame frequency of 130 Hz)*

Owing to the characteristics of LCD unit, * shadowing' will become more eminent as frame frequency goes up, while flicker will be reduced,

According to our experiments, frame cycle of 12.8 ms Min. or frame frequency of 78 Hz Max, will demonstrate optimum display quality in terms of flicker and ' shadowing'. But since judgement of display quality is subjective and display quality such as 'shadowing' is pattern dependent, it is recommended that decision of frame frequency, to which power consumption of the LCD unit is promotional, be made based on your own through testing on the LCD unit with every possible patterns displayed on it,

- *2 $(t_{CK} - t_{WCKH} - t_{WCKL}) / 2 \geq 20 \text{ ns} \cdot \cdot \cdot 20 \text{ ns MAX}$

$(t_{CK} - t_{WCKH} - t_{WCKL}) / 2 < 20 \text{ ns} \cdot \cdot \cdot (t_{CK} - t_{WCKH} - t_{WCKL}) / 2 \text{ MAX}$

- *3 The intervals of 1 LP fall and the next must be always the same when the LCD UNIT is active driving,
And LP's must be input continuously.

6. Module Driving Method

6.1 Circuit configuration

Fig. 9 shows the block diagram of the module's circuitry.

6.2 Display Face Configuration

The display consists of 640x3 (R, G, B) x480 dots as shown in Fig. 1.

The interface is single panel with double drive to be driven at 1/244 duty ratio,

6.3 Input Data and Control Signal

The LCD driver is 240 bits LSI, consisting of shift registers, latch circuits and LCD driver circuits, Input data for each row (640x3 R, G, B) will be sequentially transferred in the form of 8 bit parallel data through shift registers from top left of the display together with clock signal (XCK).

When input of one row (640 x 3, R, G, B dots) is completed, the data will be latched in the form of parallel data corresponding to the signal electrodes by the falling edge-of latch signal (LP). Then, the corresponding drive signals will be transmitted to the 640 x 3 lines of column electrodes of the LCD panel by the LCD drive circuits,

At this time, scan start-up signal (YD) has been transferred from the scan signal driver to the 1st row of scan electrodes, and the contents of the data signals are displayed on the 1st row of the display face according to the combinations of voltages applied to the scan and signal electrodes of the LCD. While the data of 1st row are being displayed, the data of 2nd row are entered, When data for 640x3 dots have been transferred, they will be latched by the falling edge of LP, switching the display to the 2nd row,

Such data : nput will be repeated up to the 240th row of each display segment, from upper row to lower rows, to complete one frame of display by time sharing method,

Simultaneously the same scanning sequence occur at the lower panel, Then data input proceeds to the next display frame,

YD generates scan signal to drive horizontal electrodes,
