# LM64K83 Passive Matrix LCD Unit

#### **FEATURES**

• Display Format: 640 (W) × 480 (H)

Overall Dimensions:
 253 (W) × 174 (H) × 7 max (D) mm

Active Area: 196 (W) × 147.6 (H) mm

• Viewing Mode: Transflective

Dot Pictch: 0.27 (W) × 0.27 (H) mm

## **DESCRIPTION**

The SHARP LM64K83 is a  $640 \times 480$  dot display unit consisting of an LCD panel, Printed Wiring Board (PWB) with electric components mounted on it, Tape Automated Bonding (TAB) to connect the LCD panel and PWB electrically, and a plastic chassis with a CCFT backlight and bezel to fit them mechanically.

#### NOTES:

1. The LCD unit functions at the minimum frame cycle of 8 ms (maximum frame frequency of 125 Hz). Due to the characteristics of the LCD unit, 'shadowing' becomes more evident as frame frequency goes up, while flicker is reduced.

According to our experiments, a minimum frame cycle of 11.7 ms or a maximum frame frequency of 85 Hz demonstrates optimum display quality in terms of flicker and 'shadowing.' Since visual judgment of display quality is subjective and display quality such as 'shadowing' is pattern dependent, base frame cycle or frame frequency, to which power consumption of the LCD unit is proportional, on thorough testing of the LCD unit with every possible pattern displayed on it.

2.  $t_{RF}$  = 50 in case  $t_{CT}$  =  $(t_{CP2} - t_{CWH} - t_{CWL})/2 \ge 50$   $t_{RF}$  =  $t_{CT}$  in case  $t_{CT}$  =  $(t_{CP2} - t_{CWH} - t_{CWL})/2 < 50$ 

#### **UNIT DRIVING METHOD**

#### **Circuit Driving Method**

Figure 2 shows the block diagram of the unit's circuitry.

#### **Display Face Configuration**

The display face electrically consists of two (upper and lower) display segments so that the unit may offer higher contrast by reducing drive duty ratio. Each display segment ( $640 \times 240$  dots) is driven at 1/240 duty ratio.

## Input Data and Control Signal

The LCD driver is 80 bits LSI, consisting of shift registers, latch circuit, and LCD driver circuits.

Display data which are externally divided into data for each row (640 dots) is sequentially transferred in the form of 4-bit parallel data through shift registers by Clock Signal CP2 from the left top of the display face.

When data of one row (640 dots) have been input, they are latched in the form of parallel data for 640 lines of signal electrodes by latch signal CP1. Then the corresponding drive signal is transmitted to the 640 lines of column electrodes of the LCD panel by the LCD drive circuits.

At this time, scan start-up signal S is transferred from the scan signal driver to the first row of scan electrodes, and the contents of the data signals are displayed on the first row of upper and lower half of the display face according to the combinations of voltages applied to the scan and signal electrodes of the LCD.

While the first row of data is being displayed, the second row of data is entered. When 640 dots of data have been transferred, then latched, on the falling edge of CP1 clock, the display face proceeds to the second rows of display.

Such data input is repeated up to the 240th row of each display segment, from upper and lower rows, to complete one frame of display using the time-sharing method. Then data input proceeds to the next display face.

Scan start-up single S generates scan signal to drive horizontal electrodes.

Since DC voltage, if applied to the LCD panel, causes chemical reaction which deteriorates the LCD panel, drive waveform is inverted at every display frame by Control Signal M to prevent the generation of such DC voltage.

Because of the characteristics of the CMOS driver LSI, the power consumption of the unit goes up as the operating frequency CP2 increases. Thus the driver LSI applies the system of transferring 4 bits of parallel data through the four lines of shift registers to reduce the data transfer speed CP2. This system minimizes power consumption of the unit.

In this circuit configuration, 4-bit display data are input to data pins  $DU_0 - DU_3$  and  $DL_0 - DL_3$ .

The LCD unit also has a bus line system for data input to minimize power consumption. In this system, the data input terminal of each driver LSI is activated only when relevant data input is fed.

Data input for column electrodes and chip select of driver LSI are made as follows:

- The driver LSI at the left end of the display face is first selected, and the adjacent driver LSI of the right side is selected when 80 dots data (20 CP2) is fed. This process continues sequentially until data is fed to the driver LSI at the right end of the display face.
- This process is immediately followed both at the top and bottom column of the driver's LSIs. Thus, data input will be made through 4-bit bus line sequentially from the left end of the display face.

Since this display unit contains no refresh RAM, it requires the above data and timing pulse inputs even for static display.

The timing chart of input signals is shown in Figure 6 and the Interface Timing Ratings table.

Page 10 LCD Data Sheet

# OPTICAL CHARACTERISTICS ( $t_A = 25^{\circ}C$ , $V_{DD} = 5.0 \text{ V}$ , $V_{DD} - V_{EE} = V_{DD}$

The following specifications are based on the electrical measuring conditions, on which the contrast of perpendicular direction ( $\theta x = \theta y = 0^{\circ}$ ) is maximum.

SYMBOL	PARAMETER	CONDITION		MIN.	TYP.	MAX.	UNIT	NOTE
θх	Viewing Angle Range –	$C_0 > 2.0$	θy = 0°	-25	-	35		
θу	Transmissive Mode	00 > 2.0	$\theta x = 0^{\circ}$	-25	ı	30	degrees	1
θх	Viewing Angle Range –	$C_0 > 2.0$	θy = 0°	-20	1	35		'
θу	Reflective Mode	00 > 2.0	$\theta x = 0^{\circ}$	-25	ı	25		
$C_0$	Contrast Ratio – Transmissive	$\theta x = \theta y$	y = 0°	8	10	1	_	2
$C_0$	Contrast Ratio – Reflective	$\theta x = \theta y$	$\theta x = \theta y = 0^{\circ}$		8	ı	1	
t <sub>R</sub>	Response Time – Rise	$\theta x = \theta y$	y = 0°	_	100	150	ma	3
t <sub>D</sub>	Response Time – Decay	$\theta x = \theta y$	y = 0°	_	150	200	ms	3

#### NOTES:

- 1. The viewing angle is defined as shown in Figure 7.
- 2. Contrast Ratio is defined as follows:
  - $Co = \frac{Luminance \;\; (brightness) \; all \; pixels' white' at \; V_{MAX}}{Luminance \;\; (brightness) \; all \; pixels' black at \; V_{MAX}}$

V<sub>MAX</sub> is defined in Figure 9.

3. The response characteristics of the photodetector output are measured as shown in Figures 10a and 10b, assuming that input signals are applied to select and deselect the dots to be measured, in the optical characteristics test method shown in Figure 11.

## CHARACTERISTICS OF BACKLIGHT

The ratings satisfy the following conditions.

## Rating

PARAMETER	MIN.	TYP.	MAX.	UNIT
Brightness	30	45	_	cd/m <sup>2</sup>

#### **Measurement Circuit**

LM000106 (SHARP) (at IL =  $5 \text{ mA}_{RMS}$ )

## **Measurement Equipment**

BM-7 (TOPCON)

#### **Measurement Conditions**

- Measurement circuit voltage: DC = 12 V at primary side.
- LCD: All digits WHITE, V<sub>DD</sub> = 5 V,
   V<sub>DD</sub> V<sub>EE</sub> = V<sub>MAX</sub>, DU<sub>0</sub> DU<sub>3</sub> (refer to Figure 9)
   DL<sub>0</sub> DL<sub>3</sub> = 'L' (WHITE).
- Ambient temperature: 25°C. Make measurement 30 minutes after turning on the unit.

# Lamp Used (Ratings, 1pc.)<sup>1</sup>

HMBS3A42W164C or FLE-30164 (AE) 8NS1170, 1 pc.

PARAMETER		MAXIMUM ALLOWABLE VALUE	NOTE
Circuit Voltage (VS)	1,000 V <sub>RMS</sub> (minimum)	1,500 V <sub>RMS</sub>	_
Discharging Tube Current (IL)	5 mA <sub>RMS</sub> (typical)	7 mA <sub>RMS</sub>	2
Power Consumption	2 W	_	_
Discharging Tube Voltage (VL)	390 V <sub>RMS</sub> (typical)	_	_
Brightness (B)	27,000 cd/m <sup>2</sup> (typical)	-	-

#### NOTES:

- 1. Within no conductor closed.
- It is recommended that IL be not more than 5 mA<sub>RMS</sub> so that heat radiation of CCFT backlight least affects the display quality.

## **Operating Life**

The operating lifetime is 10,000 hours or more at 5 mA (operating life with LM000106 or equivalent).

The inverter should meet the following conditions:

- Sine, symmetric waveform without spike in positive and negative.
- The voltage at the secondary side is 900 V<sub>RMS</sub> or more.
- Illuminance frequency is from 25 kHz to 45 kHz.

The operating lifetime is defined as having ended when any of the following conditions occur (25  $\pm 5$ °C):

- When the voltage required for initial discharge has reached 740 V<sub>RMS</sub>, or when it has reached 7.2 VDC when an inverter is used.
- When the illuminence or quantity of light has decreased to 50% of the initial value.

**NOTE:** Ratings are defined as the average brightness inside the viewing area specified in Figure 12.

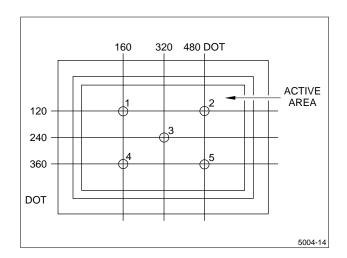

Figure 12. Measuring Points (1 to 5)

#### **PRECAUTIONS**

- Industrial (Mechanical) design of the product in which this LCD unit is incorporated must be made so that the viewing angle characteristics of the LCD are optimized. This unit's viewing angle is illustrated in Figure 13 and as follows:
  - θy MIN < viewing angle < θy MAX
     (θy MIN < 0° θy MAX ≥ 0°)</li>
     (For the specific values of θy MIN, θy MAX, refer to the Optical Characteristics Table.) Consider the optimum viewing conditions according to the purpose when installing the unit.

Page 16 LCD Data Sheet

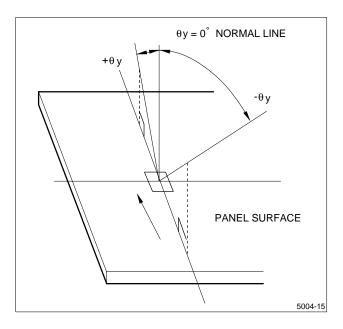

Figure 13. Dot Matrix Viewing Angle

- This unit is installed using mounting tabs at the four corners of PCB or bezel. During installation, avoid undue stress on the unit such as twisting or bending. A transparent acrylic resin board or other type of protective panel should be attached to the front of the unit to protect the polarizer, LCD cells, etc.
- Since the front polarizer is easily damaged, use care to not scratch the face.
- If the surface of the LCD cells need cleaning, wipe it with a soft cloth.
- Wipe liquid off immediately since it can cause color changes and staining.
- The LCD is made of glass plates. Use care when handling it to avoid breakage.
- This unit contains CMOS LSIs which are sensitive to electrostatic charges. The following measures should be taken to protect the unit from electrostatic discharge:
  - Ground the metallic case of the main system (contact of the unit and main system).
  - Insulate the unit and main system by attaching insulating washers made of bakelite or nylon.

- The unit should be driven according to the specified ratings to avoid malfunction or permanent damage. DC voltage drive leads to rapid deterioration of LC, so ensure that the drive is an alternating waveform by continuously applying the signal M. Avoid latchup of driver LSIs and application of DC voltage to the LCD panel by following the ON/OFF sequence shown in Figure 14 and Table 1.
- Do not expose the unit to direct sunlight, strong ultraviolet light, etc., for prolonged periods.
- Store the unit at normal room temperatue to prevent the LC from converting to liquid (due to excessive temperature changes).
- Do not disassemble the unit.

#### SUPPLY VOLTAGE SEQUENCE CONDITION

Refer to Figure 14 and Table 1.

**Table 1. Supply Voltage Sequence Condition** 

SYMBOL	WITH DISP CONTROL 1	WITHOUT DISP CONTROL <sup>2</sup>
POWER ON		
а	0 ms (minimum)	0 ms (minimum) 20 ms (maximum)
b	0 ms (minimum)	20 ms (minimum)
С	20 ms (minimum)	_
d	0 ms (minimum)	_
е	_	0 ms (minimum)
f	0 ms (minimum)	Note 3
g	-	0 ms (minimum) 100 ms (maximum)
POWER OFF		
h	0 ms (minimum)	0 ms (minimum) 20 ms (maximum)
i	0 ms (minimum)	20 ms (minimum)

I	_	0 ms (minimum)
m	0 ms (minimum)	Note 3
n	_	100 ms (minimum)

#### NOTES:

- 1. Connection of DISP (pin number 4), refer to Figure 15.
- 2. Connection of DISP (pin number 4), refer to Figure 16.
- Power ON/OFF cycle time. All signals and power line shall be in accordance with above sequence in case of power ON/OFF.

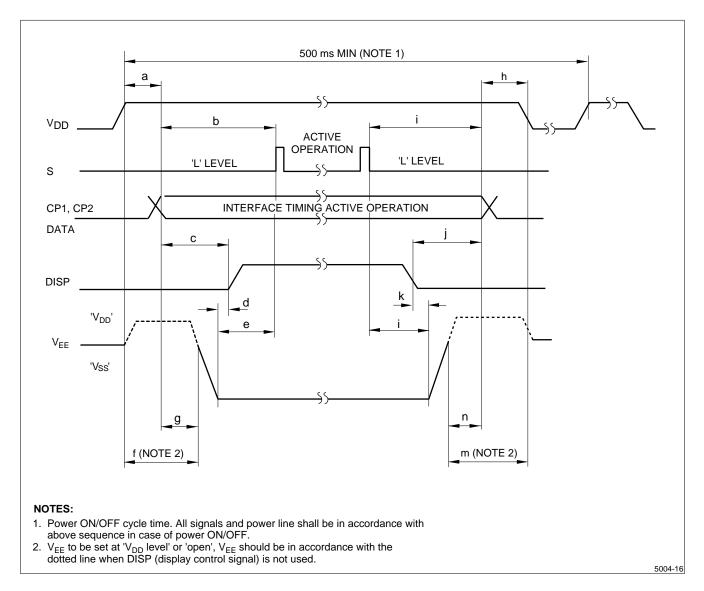

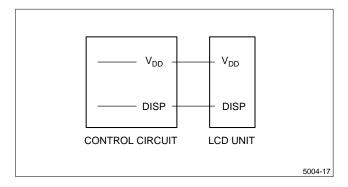

Figure 14. Supply Voltage Sequence Condition

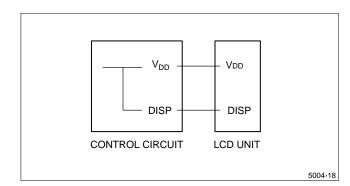

Figure 16. Without DISP Control

Page 18 LCD Data Sheet

#### **LOT NUMBER**

Lot number is shown at the position mentioned in Figure 17 in accordance with the numbering rule shown in Figure 18.

#### APPLICABLE INSPECTION STANDARD

The LCD unit meets the following inspection standard: S-U-012-01.

#### **DISPLAY QUALITY**

This specification describes display quality in case of no gray scale. Since display quality can be affected by gray scale methods, evaluate display quality for the usability of the LCD unit in case gray scale is displayed on the LCD unit.

**WARNING**: Don't use any materials which emit gas from epoxy resin (Amines' hardener) and silicone adhesive agent (dealcohol or deoxym) to prevent polarizer color change caused by gas.
