LMZM33602 4-V to 36-V Input, 2-A Step-Down DC/DC Power Module in QFN Package

1 Features

- Complete Integrated Power Solution
  - As Few as 4 External Components
  - Minimum Solution Size < 100 mm^2
- 9 mm × 7 mm × 4 mm QFN Package
  - All Pins Accessible from Package Perimeter
  - Pin Compatible with 3-A LMZM33603
- Input Voltage Range: 4 V to 36 V
- Output Voltage Range: 1 V to 18 V
- Efficiencies Up To 95%
- Adjustable Switching Frequency (200 kHz to 1.2 MHz)
- Allows Synchronization to an External Clock
- Power-Good Output
- Meets EN55011 Class B Radiated EMI Standards
- Operating IC Junction Range: –40°C to +125°C
- Operating Ambient Range: –40°C to +105°C
- Create a Custom Design Using the LMZM33602 With the WEBENCH® Power Designer

2 Applications

- Factory and Building Automation
- Smart Grid and Energy
- Industrial
- Medical
- Defense
- Inverted Output Applications

3 Description

The LMZM33602 power module is an easy-to-use integrated power solution that combines a 2-A, step-down, DC/DC converter with power MOSFETs, a shielded inductor, and passives into a low-profile package. This power solution requires as few as four external components and eliminates the loop compensation and magnetics part selection from the design process.

The 9 mm × 7 mm × 4 mm, 18-pin QFN package is easy to solder onto a printed circuit board and allows a compact, low-profile, point-of-load design. The full feature set, including power good, programmable UVLO, prebias start-up, overcurrent and overtemperature protections, make the LMZM33602 an excellent device for powering a wide range of applications.

Device Information

DEVICE NUMBER	PACKAGE	BODY SIZE (NOM)

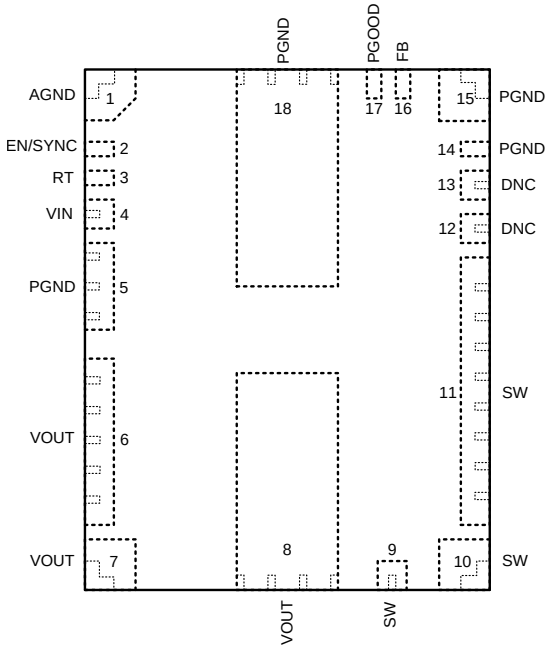
18-Pin QFN
Top View



Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	AGND	G	Analog ground. Zero voltage reference for internal references and logic. Do not connect this pin to PGND; the connection is made internal to the device. See the *Layout* section of the datasheet for a recommended layout.
2	EN/SYNC	I	EN - Enable input to regulator. High = On, Low = Off. Can be connected to VIN. Do not float. This pin can be used to set the input under voltage lockout with two resistors. See the *Programmable Undervoltage Lockout (UVLO)* section. SYNC - The internal oscillator can be synchronized to an external clock via AC-coupling. See the *Synchronization (SYNC)* section for details.
3	RT	I	An external timing resistor connected between this pin and AGND adjusts the switching frequency of the device. If left open, the default switching frequency is 400 kHz.
4	VIN	I	Input supply voltage. Connect external input capacitors between this pin and PGND.
5, 14, 15, 18	PGND	G	Power ground. This is the return current path for the power stage of the device. Connect pin 5 to the input source, the load, and to the bypass capacitors associated with VIN and VOUT using power ground planes on the PCB. **Pins 14 and 15 are not connected to PGND internal to the device and must be connected to PGND at pad 18.** Connect pad 18 to the power ground planes using multiple vias for good thermal performance. See the *Layout* section of the datasheet for a recommended layout.
6, 7, 8	VOUT	O	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external bypass capacitors between these pins and PGND.
9, 10, 11	SW	O	Switch node. Connect these pins to a small copper island under the device for thermal relief. Do not place any external component on these pins or tie them to a pin of another function.
12, 13	DNC	—	Do not connect. **Each pin must be soldered to an isolated pad**. These pins connect to internal circuitry. Do not connect these pins to one another, AGND, PGND, or any other voltage.
16	FB	I	Feedback input. Connect the center point of the feedback resistor divider to this pin. Connect the upper resistor (R_{FBT}) of the feedback divider to V_{OUT} at the desired point of regulation. Connect the lower resistor (R_{FBB}) of the feedback divider to AGND.
17	PGOOD	O	Open drain output for power-good flag. Use a 10-kΩ to 100-kΩ pullup resistor to logic rail or other DC voltage no higher than 12 V.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating ambient temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Input voltage	VIN	–0.3	42	V
	EN/SYNC	–5.5	V_{IN} + 0.3	V
	PGOOD	–0.3	15	V
	FB, RT	–0.3	4.5	V
Output voltage	SW	–1	V_{IN} + 0.3	V
	SW (< 10-ns transients)	–5	42	V
	VOUT	–0.3	V_{IN}	V
Sink current	PGOOD		3	mA
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		500	G
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20 to 2000 Hz		20	G
Operating IC junction temperature, T_J (2)		–40	125	°C
Operating ambient temperature, T_A (2)		–40	105	°C
Storage temperature, T_{stg}		–40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The ambient temperature is the air temperature of the surrounding environment. The junction temperature is the temperature of the internal power IC when the device is powered. Operating below the maximum ambient temperature, as shown in the safe operating area (SOA) curves in the typical characteristics sections, ensures that the maximum junction temperature of any component inside the module is never exceeded.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating ambient temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Input voltage, V_{IN}	4(1)	36	V
Output voltage, V_{OUT}	1	18	V
EN/SYNC voltage	–5	VIN	V
PGOOD pullup voltage, V_{PGOOD}	–0.3	12	V
PGOOD sink current, I_{PGOOD}		1	mA
Output current, I_{OUT}	0	2	A
Operating ambient temperature, T_A	–40	105	°C

(1) For output voltages ≤ 5 V, the recommended minimum V_{IN} is 4 V or (V_{OUT} + 1.5 V), whichever is greater. For output voltages > 5 V, the recommended minimum V_{IN} is (1.3 × V_{OUT}). See *Voltage Dropout* for information on voltage dropout.

6.4 Thermal Information

THERMAL METRIC[1]		LMZM33602 RLR (QFN) 18 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance[2]	18.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter[3]	2.0	°C/W
ψ_{JB}	Junction-to-board characterization parameter[4]	6.2	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.
(2) The junction-to-ambient thermal resistance, $R_{\theta JA}$, applies to devices soldered directly to a 63 mm × 63 mm, 4-layer PCB with 2 oz. copper and natural convection cooling. Additional airflow reduces $R_{\theta JA}$.
(3) The junction-to-top board characterization parameter, ψ_{JT}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (section 6 and 7). $T_J = \psi_{JT} \times Pdis + T_T$; where Pdis is the power dissipated in the device and T_T is the temperature of the top of the device.
(4) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \psi_{JB} \times Pdis + T_B$; where Pdis is the power dissipated in the device and T_B is the temperature of the board 1mm from the device.

6.5 Electrical Characteristics

Over –40°C to +105°C ambient temperature, V_{IN} = 24 V, V_{OUT} = 5 V, I_{OUT} = I_{OUT} maximum, f_{sw} = 450 kHz (unless otherwise noted); C_{IN1} = 2 × 4.7-µF, 50-V, 1210 ceramic; C_{IN2} = 100-µF, 50-V, electrolytic; C_{OUT} = 4 × 22-µF, 25-V, 1210 ceramic. Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm and are provided for reference only.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
INPUT VOLTAGE (V_{IN})							
V_{IN}	Input voltage	Over I_{OUT} range		4[1]		36	V
UVLO	V_{IN} undervoltage lockout	V_{IN} increasing		3.3	3.6	3.9	V
		V_{IN} decreasing		3	3.3	3.5	V
I_{SHDN}	Shutdown supply current	V_{EN} = 0 V, V_{IN} = 12 V			2	4	µA
OUTPUT VOLTAGE (V_{OUT})							
$V_{OUT(ADJ)}$	Output voltage adjust	Over I_{OUT} range		1		18	V
$V_{OUT(Ripple)}$	Output voltage ripple	20-MHz bandwidth			10		mV
FEEDBACK							
V_{FB}	Feedback voltage[2]	T_A = 25°C, I_{OUT} = 0 A		0.985	1	1.015	V
		Over V_{IN} range, –40°C ≤ T_J ≤ 125°C, I_{OUT} = 0 A		0.98	1	1.02	V
	Load regulation	Over I_{OUT} range, T_A = 25°C			0.04%		
I_{FB}	Feedback leakage current	V_{FB} = 1 V			10		nA
CURRENT							
I_{OUT}	Output current	Natural convection, T_A = 25°C		0		2	A
	Overcurrent threshold				3.6		A
PERFORMANCE							
η	Efficiency	V_{IN} = 24 V, I_{OUT} = 1 A	V_{OUT} = 12 V, f_{SW} = 900 kHz		94%		
			V_{OUT} = 5 V, f_{SW} = 450 kHz		90%		
			V_{OUT} = 3.3 V, f_{SW} = 300 kHz		88%		
		V_{IN} = 12 V, I_{OUT} = 1 A	V_{OUT} = 5 V, f_{SW} = 450 kHz		93%		
			V_{OUT} = 3.3 V, f_{SW} = 300 kHz		91%		
			V_{OUT} = 2.5 V, f_{SW} = 250 kHz		89%		
	Transient response	25% to 75% load step 1 A/µs slew rate	Over/undershoot		90		mV
			Recovery time		55		µs

(1) See *Voltage Dropout* for information on voltage dropout.
(2) The overall output voltage tolerance will be affected by the tolerance of the external R_{FBT} and R_{FBB} resistors.

Electrical Characteristics (continued)

Over –40°C to +105°C ambient temperature, V_{IN} = 24 V, V_{OUT} = 5 V, I_{OUT} = I_{OUT} maximum, f_{sw} = 450 kHz (unless otherwise noted); C_{IN1} = 2 × 4.7-µF, 50-V, 1210 ceramic; C_{IN2} = 100-µF, 50-V, electrolytic; C_{OUT} = 4 × 22-µF, 25-V, 1210 ceramic. Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm and are provided for reference only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SOFT START						
T_{SS}	Internal soft start time			6		ms
THERMAL						
T_{SHDN}	Thermal shutdown	Shutdown temperature		170		°C
		Hysteresis		15		°C
ENABLE (EN)						
V_{EN-H}	EN rising threshold		1.4	1.55	1.7	V
V_{EN-HYS}	EN hysteresis voltage			0.4		V
I_{EN}	EN Input leakage current	V_{IN} = 4 V to 36 V, V_{EN} = 2 V		10	100	nA
		V_{IN} = 4 V to 36 V, V_{EN} = 36 V			1	µA
POWER GOOD (PGOOD)						
V_{PGOOD}	PGOOD thresholds	V_{OUT} rising (good)	92%	94%	96.5%	
		V_{OUT} rising (fault)	104%	107%	110%	
		V_{OUT} falling hysteresis		1.5%		
	Minimum V_{IN} for valid PGOOD	50-µA pullup, V_{EN} = 0 V, T_A = 25°C			1.5	V
	PGOOD low voltage	0.5-mA pullup, V_{EN} = 0 V			0.4	V
CAPACITANCE						
C_{IN}	External input capacitance	Ceramic type	9.4 (3)			µF
		Non-ceramic type		47 (3)		µF
C_{OUT}	External output capacitance		min (4)		max (5)	µF

(3) A minimum of 9.4 µF (2 × 4.7 µF) ceramic input capacitance is required for proper operation. An additional 47 µF of bulk capacitance is recommended for applications with transient load requirements. See the *Input Capacitors* section of the datasheet for further guidance.
(4) The minimum amount of required output capacitance varies depending on the output voltage (see *Output Capacitor Selection*). A minimum amount of ceramic output capacitance is required. Locate the capacitance close to the device. Adding additional ceramic or non-ceramic capacitance close to the load improves the response of the regulator to load transients.
(5) The maximum allowable output capacitance varies depending on the output voltage (see *Output Capacitor Selection*).

6.6 Switching Characteristics

Over operating ambient temperature range (unless otherwise noted)

Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm, and are provided for reference only.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
FREQUENCY (RT) and SYNCHRONIZATION (EN/SYNC)						
f_{SW}	Default switching frequency	RT pin = open	340	400	460	kHz
	Switching frequency range		200		1200	kHz
V_{SYNC}	Peak-to-peak amplitude of SYNC clock AC signal (measured at SYNC pin)		2.8		5.5	V
T_{S-MIN}	Minimum SYNC ON/OFF time			100		ns

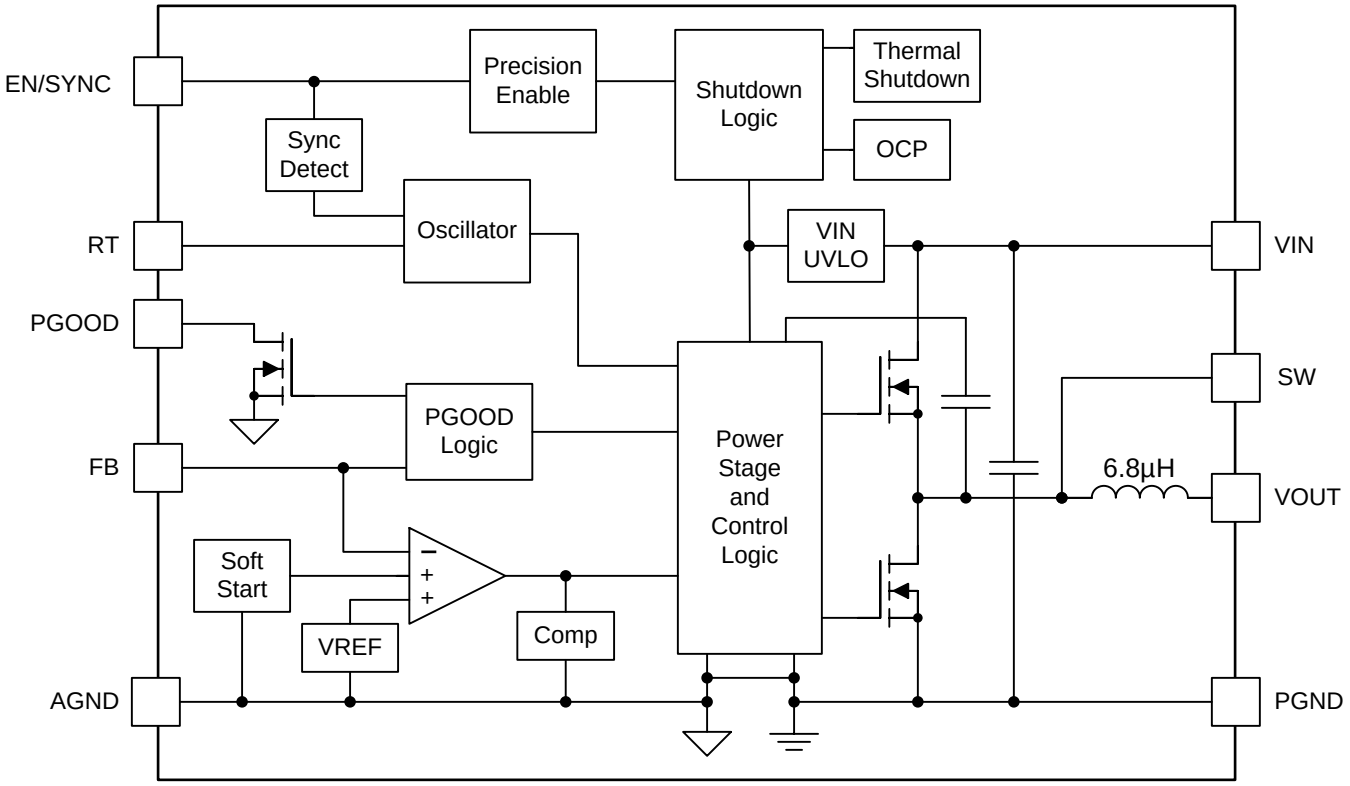
7 Detailed Description

7.1 Overview

The LMZM33602 is a full-featured, 36-V input, 2-A, synchronous step-down converter with PWM, MOSFETs, shielded inductor, and control circuitry integrated into a low-profile, overmolded package. The device integration enables small designs, while providing the ability to adjust key parameters to meet specific design requirements. The LMZM33602 provides an output voltage range of 1 V to 18 V. An external resistor divider is used to adjust the output voltage to the desired value. The switching frequency can also be adjusted, by either an external resistor or a sync signal, which allows the LMZM33602 to accommodate a variety of input and output voltage conditions as well as optimize efficiency. The device provides accurate voltage regulation over a wide load range by using a precision internal voltage reference. Input undervoltage lockout is internally set at 3.6 V (typical), but can be adjusted upward using a resistor divider on the EN/SYNC pin of the device. The EN/SYNC pin can also be pulled low to put the device into standby mode to reduce input quiescent current. A power-good signal is provided to indicate when the output is within its nominal voltage range. Thermal shutdown and current limit features protect the device during an overload condition. An 18-pin, QFN package that includes exposed bottom pads provides a thermally enhanced solution for space-constrained applications.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Adjusting the Output Voltage

A resistor divider connected to the FB pin (pin 16) programs the output voltage of the LMZM33602. The output voltage adjustment range is from 1 V to 18 V. Figure 14 shows the feedback resistor connections for setting the output voltage. The recommended value of R_{FBB} is 10 kΩ. The value for R_{FBT} can be calculated using Equation 1. Depending on the output voltage, a feed-forward capacitor, C_{FF}, may be required for optimum transient performance. Table 1 lists the standard external R_{FBT} and C_{FF} values for several output voltages between 2.5 V and 18 V. Table 2 lists the values for output voltages below 2.5 V. Additionally, Table 1 and Table 2 include the recommended switching frequency (F_{SW}), the frequency setting resistor (R_{RT}), and the minimum and maximum output capacitance for each of the output voltages listed.

For designs with R_{FBB} other than 10 kΩ, adjust C_{FF} and R_{FBT} such that (C_{FF} × R_{FBT}) is unchanged and adjust R_{FBT} such that (R_{FBT} / R_{FBB}) is unchanged.

$$R_{FBT} = 10 \times (V_{OUT} - 1)(k\Omega) \quad (1)$$

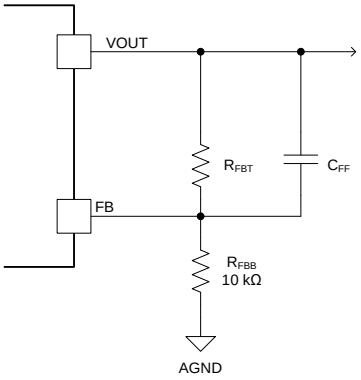


Figure 14. Setting the Output Voltage

Feature Description (continued)

Table 1. Required Component Values (V_{OUT} ≥ 2.5 V)

V_{OUT} (V)	R_{FBT} (kΩ)(1)	C_{FF} (pF)	f_{SW} (kHz)	R_{RT} (kΩ)	$C_{OUT(min)}$ (µF)(2)	$C_{OUT(max)}$ (µF)(3)
2.5	15.0	220	250	162	150	400
3.3	23.2	150	300	133	88	300
5	40.2	100	450	88.7	66	200
6	49.9	68	550	71.5	54	160
7.5	64.9	47	650	60.4	40	130
9	80.6	47	700	56.2	36	110
12	110	open	900	44.2	22	80
13.5	124	open	1000	39.2	22	75
15	140	open	1100	35.7	20	65
18	169	open	1200	33.2	16	55

(1) R_{FBB} = 10.0 kΩ.
(2) For output voltages ≥ 2.5 V, the minimum required output capactiance must be comprised of **ceramic** type and account for DC bias and temperature derating.
(3) The maximum output capactiance must include the required ceramic $C_{OUT(min)}$. Additional capacitance, may be ceramic type, low-ESR polymer type, or a combination of the two.

Table 2. Required Component Values (V_{OUT} < 2.5 V)

V_{OUT} (V)	R_{FBT} (kΩ)(1)	C_{FF} (pF)	F_{SW} (kHz)	R_{RT} (kΩ)	C_{OUT}
1 to 2.5	see Equation 1	open	250	162	150-µF ceramic + 470-µF polymer

(1) R_{FBB} = 10 kΩ. For V_{OUT} = 1 V, R_{FBB}= open and R_{FBT} = 0 Ω.

7.3.2 Feed-Forward Capacitor, C_{FF}

The LMZM33602 is internally compensated to be stable over the operating frequency and output voltage range. However, depending on the output voltage, an additional feed-forward capacitor may be required. TI recommends an external feed-forward capacitor, C_{FF}, be placed in parallel with the top resistor divider, R_{FBT} for optimum transient performance. The value for C_{FF} can be calculated using Equation 2.

$$C_{FF} = \frac{1000}{4\pi\left(\frac{8.32}{V_{OUT} \times C_{OUT}}\right) \times R_{FBT}} (pF) \quad (2)$$

where

- C_{OUT} is the value after derating in µF
- R_{FBT} is in kΩ

Refer to the *Table 1* for the recommended C_{FF} value for several output voltages.

7.3.3 Voltage Dropout

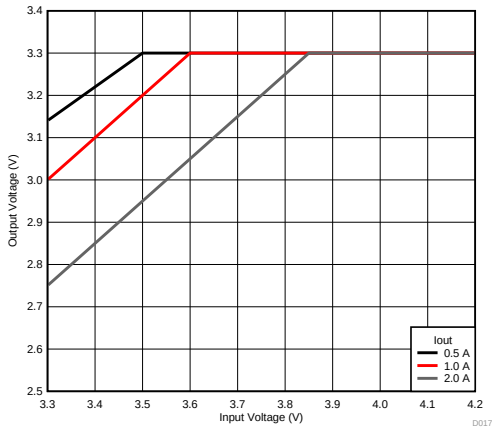
Voltage dropout is the difference between the input voltage and output voltage that is required to maintain output voltage regulation while providing the rated output current.

To ensure the LMZM33602 maintains output voltage regulation at the recommended switching frequency, over the operating temperature range, the following requirements apply:

For output voltages ≤ 5 V, the minimum V_{IN} is 4 V or (V_{OUT} + 1.5 V), whichever is greater.

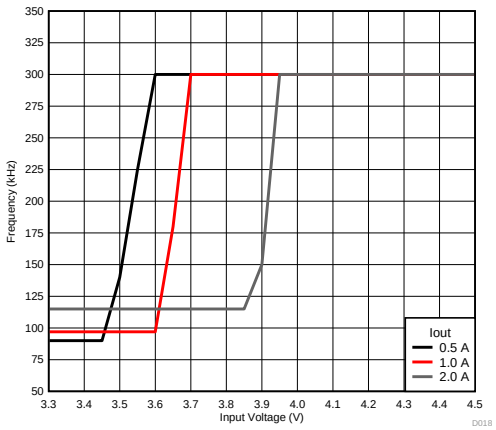
For output voltages > 5 V, the minimum V_{IN} is (1.3 × V_{OUT}).

However, if fixed switching frequency operation is not required, the LMZM33602 operates in a frequency foldback mode when the dropout voltage is less than the recommendations above. Frequency foldback reduces the switching frequency to allow the output voltage to maintain regulation as input voltage decreases. Figure 15 through Figure 20 show typical dropout voltage and frequency foldback curves for 3.3 V, 5 V, and 12 V outputs at T_A = 25°C. (Note: As ambient temperature increases, dropout voltage and frequency foldback occur at higher input voltage.)



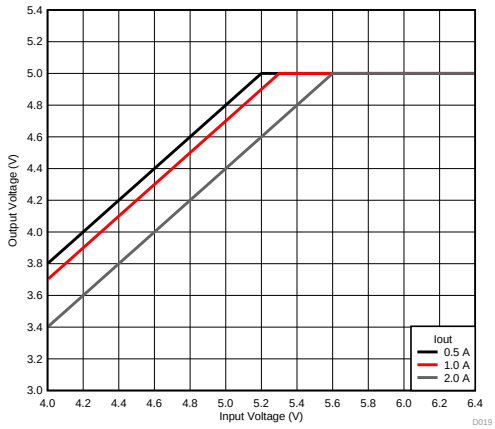
V_{OUT} = 3.3 V f_{SW} = 300 kHz

Figure 15. Voltage Dropout



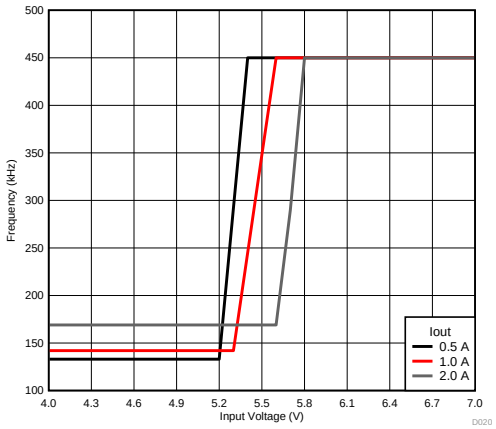
V_{OUT} = 3.3 V f_{SW} = 300 kHz

Figure 16. Frequency Foldback



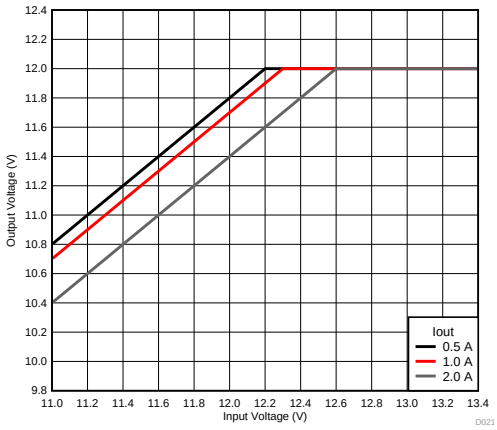
V_{OUT} = 5 V f_{SW} = 450 kHz

Figure 17. Voltage Dropout



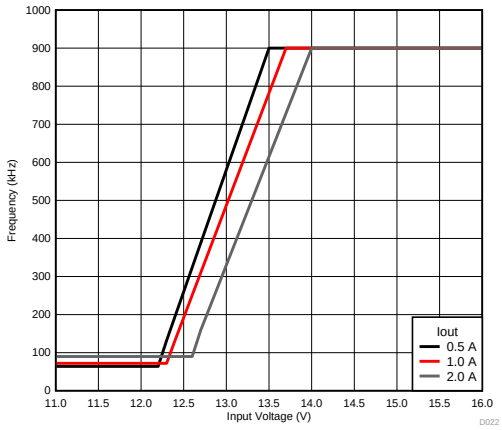
V_{OUT} = 5 V f_{SW} = 450 kHz

Figure 18. Frequency Foldback



V_{OUT} = 12 V f_{SW} = 900 kHz

Figure 19. Voltage Dropout



V_{OUT} = 12 V f_{SW} = 900 kHz

Figure 20. Frequency Foldback

7.3.4 Switching Frequency (RT)

The switching frequency range of the LMZM33602 is 200 kHz to 1.2 MHz. The switching frequency can easily be set by connecting a resistor (R_{RT}) between the RT pin and AGND. Additionally, the RT pin can be left floating and the LMZM33602 will operate at 400 kHz default switching frequency. Use Equation 3 to calculate the R_{RT} value for a desired frequency or simply select from Table 3.

The switching frequency must be selected based on the output voltage setting of the device and the operating input voltage. See Table 3 for R_{RT} resistor values and the allowable output voltage range for a given switching frequency for three common input voltages.

$$R_{RT} = \left(\frac{40200}{f_{SW}\,(kHz)} \right) - 0.6\,(k\Omega) \tag{3}$$

Table 3. Switching Frequency vs Output Voltage

SWITCHING FREQUENCY (kHz)	R_{RT} RESISTOR (kΩ)	V_{IN} = 5 V (±5%)		V_{IN} = 12 V (±5%)		V_{IN} = 24 V (±5%)	
		V_{OUT} RANGE (V)		V_{OUT} RANGE (V)		V_{OUT} RANGE (V)

1200	33.2	1	3	1.6	8.5	3.1	18

7.3.5 Synchronization (SYNC)

The LMZM33602 switching frequency can also be synchronized to an external clock from 200 kHz to 1.2 MHz. To implement the synchronization feature, couple an AC signal to the EN/SYNC pin (pin 2) with a peak-to-peak amplitude of at least 2.8 V, not to exceed 5.5 V. The minimum SYNC clock ON and OFF time must be longer than 100ns. The AC signal must be coupled through a small capacitor (1 nF) as shown in Figure 21. R_{ENT} is required for this synchronization circuit, but R_{ENB} is not required if an external UVLO adjustment is not needed.

Before the external clock is present, or when a valid clock signal is removed, the device works in RT mode and the switching frequency is set by R_{RT} resistor. Select R_{RT} so that it sets the frequency close to the external synchronization frequency. When the external clock is present, the SYNC mode overrides the RT mode.

The synchronization frequency must be selected based on the output voltages of the devices being synchronized. Table 3 shows the allowable frequencies for a given range of output voltages. For the most efficient solution, always select the lowest allowable frequency.

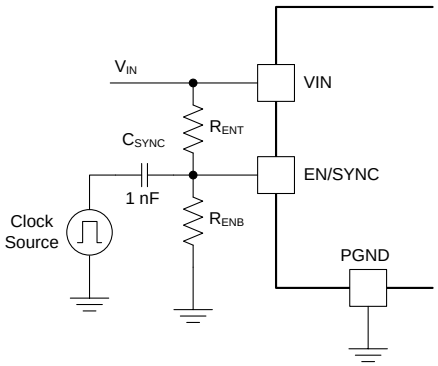

Figure 21. AC Coupled SYNC Signal

7.3.6 Input Capacitors

The LMZM33602 requires a minimum input capacitance of 9.4 µF (2 × 4.7 µF) of ceramic type. High-quality, ceramic-type X5R or X7R capacitors with sufficient voltage rating are recommended. TI recommends an additional 100 µF of non-ceramic capacitance for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage.

Table 4. Recommended Input Capacitors(1)

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS

(2) Standard capacitance values
(3) Maximum ESR @ 100 kHz, 25°C.

7.3.7 Output Capacitors

The LMZM33602 minimum and maximum output capacitance listed in Table 1 and Table 2 represents the amount of *effective* capacitance. The effects of DC bias and temperature variation must be considered when using ceramic capacitance. For ceramic capacitors, the package size, voltage rating, and dielectric material will contribute to differences between the standard rated value and the actual effective value of the capacitance.

When adding additional capacitance, above $C_{OUT(min)}$, the capacitance may be ceramic type, low-ESR polymer type, or a combination of the two. See Table 5 for a preferred list of output capacitors by vendor.

Table 5. Recommended Output Capacitors (1)

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS

(3) Maximum ESR @ 100 kHz, 25°C.

7.3.8 Output On/Off Enable (EN)

The voltage on the EN/SYNC pin provides electrical ON/OFF control of the device. Once the EN pin voltage exceeds the threshold voltage, the device starts operation. If the EN pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The EN pin cannot be open circuit or floating. The simplest way to enable the operation of the LMZM33602 is to connect the EN pin to VIN directly as shown in Figure 22. This allows self-start-up of the LMZM33602 when VIN is within the operation range.

If an application requires controlling the EN pin, an external logic signal can be used to drive EN/SYNC pin as shown in Figure 23. Applications using an open drain/collector device to interface with this pin require a pull-up resistor to a voltage above the enable threshold.

Figure 24 and Figure 25 show typical turn-ON and turn-OFF waveforms using the enable control.

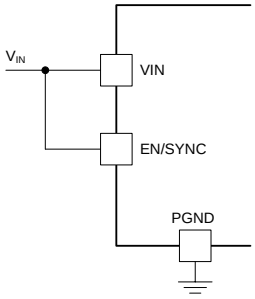

Figure 22. Enabling the Device

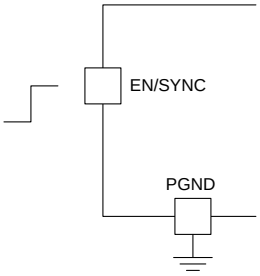

Figure 23. Typical Enable Control

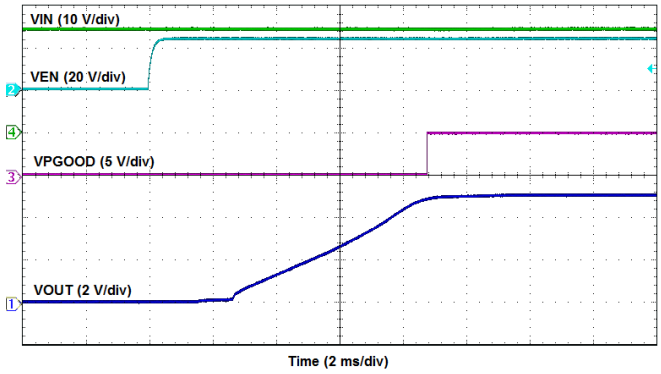

Figure 24. Enable Turn-ON

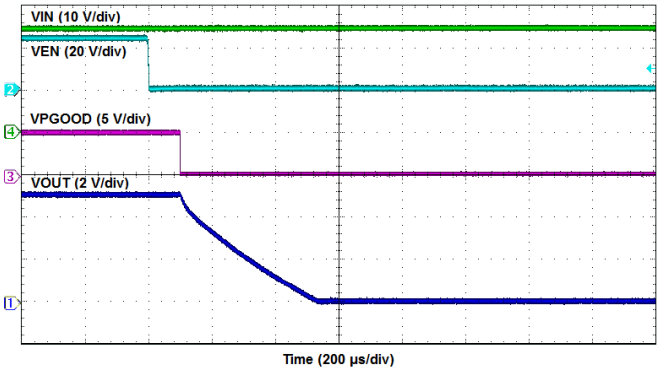

Figure 25. Enable Turn-OFF

7.3.9 Programmable Undervoltage Lockout (UVLO)

The LMZM33602 implements internal UVLO circuitry on the VIN pin. The device is disabled when the VIN pin voltage falls below the internal VIN UVLO threshold. The internal VIN UVLO rising threshold is 3.9 V (maximum) with a typical hysteresis of 300 mV.

If an application requires a higher UVLO threshold, a resistor divider can be placed on the EN/SYNC pin as shown in Figure 26. Table 6 lists recommended resistor values for R_{ENT} and R_{ENB} to adjust the ULVO voltage.

To insure proper start-up and reduce input current surges, the UVLO threshold must be set to at least (V_{OUT} + 1.5 V) for output voltages ≤ 5 V and at least (1.3 × V_{OUT}) for output voltages > 5 V. TI recommends to set the UVLO threshold to approximately 80% to 85% of the minimum expected input voltage.

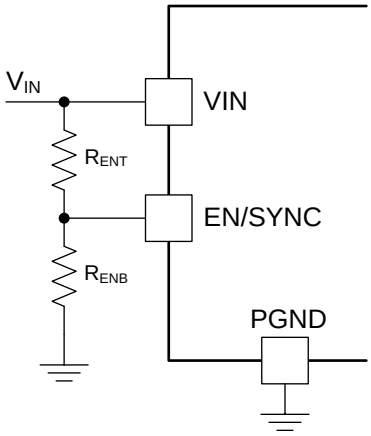

Figure 26. Adjustable UVLO

Table 6. Resistor Values for Adjusting UVLO

VIN UVLO (V)	6.5	10	15	20	25	30
R_{ENT} (kΩ)	100	100	100	100	100	100
R_{ENB} (kΩ)	35.7	20.5	12.7	9.31	7.32	6.04

7.3.10 Power Good (PGOOD)

The LMZM33602 has a built in power-good signal (PGOOD) which indicates whether the output voltage is within its regulation range. The PGOOD pin is an open-drain output that requires a pullup resistor to a nominal voltage source of 12 V or less. The maximum recommended PGOOD sink current is 1 mA. A typical pullup resistor value is between 10 kΩ and 100 kΩ.

Once the output voltage rises above 94% of the set voltage, the PGOOD pin rises to the pullup voltage level. The PGOOD pin is pulled low when the output voltage drops lower than 92.5% or rises higher than 107% of the nominal set voltage. See Figure 27 for typical power-good thresholds.

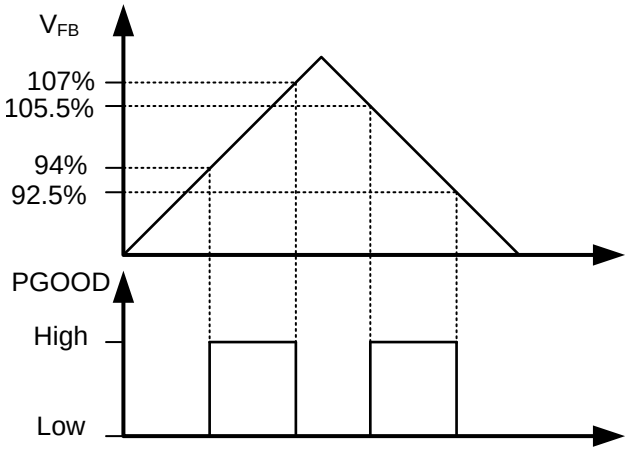

Figure 27. Power Good Flag

7.3.11 Overcurrent Protection (OCP)

The LMZM33602 is protected from overcurrent conditions. Hiccup mode is activated if a fault condition persists to prevent overheating. In hiccup mode, the regulator is shut down and kept off for 10 ms typical before the LMZM33602 tries to start again. If overcurrent or short-circuit fault condition still exist, hiccup repeats until the fault condition is removed. Hiccup mode reduces power dissipation under severe overcurrent conditions, and prevents overheating and potential damage to the device. Once the fault is removed, the module automatically recovers and returns to normal operation as shown in Figure 29.

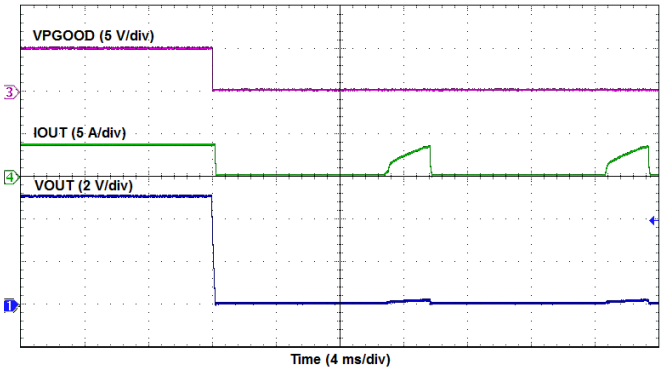

Figure 28. Overcurrent Limiting

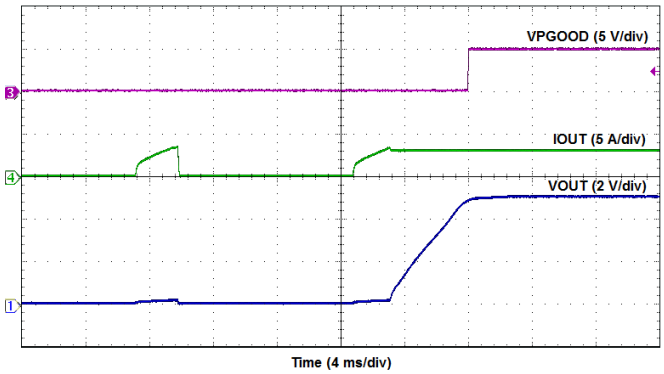

Figure 29. Removal of Overcurrent

7.3.12 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 170°C typically. The device reinitiates the power up sequence when the junction temperature drops below 155°C typically.

7.4 Device Functional Modes

7.4.1 Active Mode

The LMZM33602 is in active mode when VIN is above the UVLO threshold and the EN/SYNC pin voltage is above the EN high threshold. The simplest way to enable the LMZM33602 is to connect the EN/SYNC pin to VIN. This allows self start-up of the LMZM33602 when the input voltage is in the operation range: 4 V to 36 V. In active mode, the LMZM33602 is in continuous conduction mode (CCM) with fixed switching frequency.

7.4.2 Shutdown Mode

The EN/SYNC pin provides electrical ON and OFF control for the LMZM33602. When the EN/SYNC pin voltage is below the EN low threshold, the device is in shutdown mode. In shutdown mode the standby current is 2 μA typical. The LMZM33602 also employs input UVLO protection. If VIN is below the UVLO level, the output of the regulator is turned off.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMZM33602 is a synchronous, step-down, DC-DC power module. It is used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 2 A. The LMZM33602 can be configured in an inverting buck-boost (IBB) topology with the output voltage inverted or negative with respect to ground. For more details, see TI Application Report *Inverting Application for the LMZM33602/03*. The following design procedure can be used to select components for the LMZM33602. Alternately, the WEBENCH® software may be used to generate complete designs. When generating a design, the WEBENCH® software utilizes an iterative design procedure and accesses comprehensive databases of components. See www.ti.com for more details.

8.2 Typical Application

The LMZM33602 only requires a few external components to convert from a wide input voltage supply range to a wide range of output voltages. Figure 30 shows a basic LMZM33602 schematic with only the minimum required components.

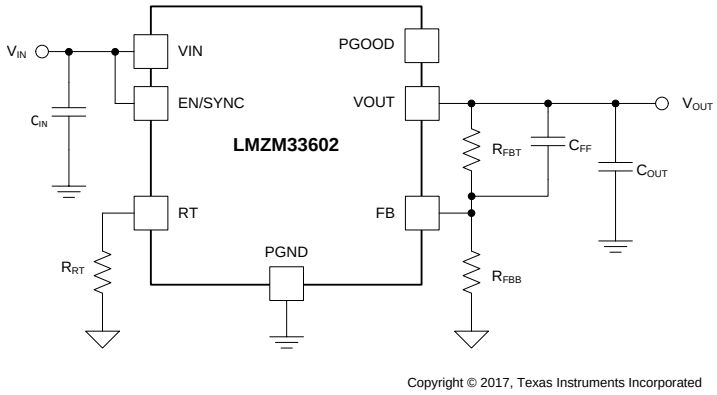

Figure 30. LMZM33602 Typical Schematic

8.2.1 Design Requirements

For this design example, use the parameters listed in Table 7 as the input parameters and follow the design procedures in *Detailed Design Procedure*.

Table 7. Design Example Parameters

DESIGN PARAMETER	VALUE
Input voltage V_{IN}	24 V typical
Output voltage V_{OUT}	5 V
Output current rating	2 A
Operating frequency	450 kHz

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the LMZM33602 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Output Voltage Setpoint

The output voltage of the LMZM33602 device is externally adjustable using a resistor divider. The recommended value of R_{FBB} is 10.0 kΩ. The value for R_{FBT} can be selected from Table 6 or calculated using Equation 4:

$$R_{FBT} = 10 \times (V_{OUT} - 1) (k\Omega) \quad (4)$$

For the desired output voltage of 5.0 V, the formula yields a value of 40 kΩ. Choose the closest available value of 40.2 kΩ for R_{FBT}.

8.2.2.3 Feed-Forward Capacitor (C_{FF})

TI recommends placing an external feed-forward capacitor, C_{FF} in parallel with the top resistor divider, R_{FBT} for optimum transient performance. The value for C_{FF} can be calculated using Equation 2 or selected from Table 1. The recommended C_{FF} value for 5-V application is 100 pF.

8.2.2.4 Setting the Switching Frequency

The recommended switching frequency for a 5-V application is 450 kHz. To set the swtiching frequency to 450 kHz, a 88.7-kΩ R_{RT} resistor is required.

8.2.2.5 Input Capacitors

The LMZM33602 requires a minimum input capacitance of 10 µF (or 2 × 4.7 µF) ceramic type. High-quality ceramic type X5R or X7R capacitors with sufficient voltage rating are recommended. An additional 100 µF of non-ceramic capacitance is recommended for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage.

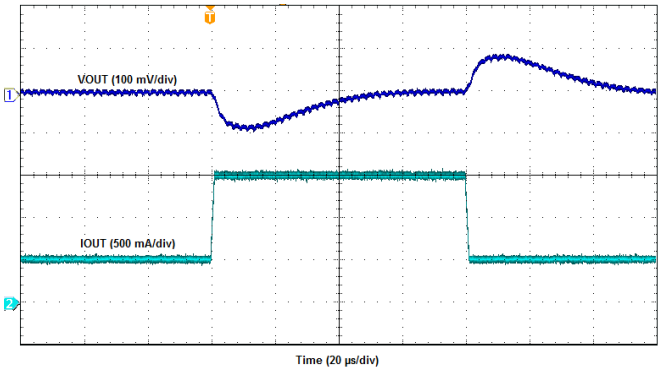
For this design, a 10-µF, 50-V, ceramic capacitor was selected.

8.2.2.6 Output Capacitor Selection

The LMZM33602 requires a minimum amount of output capacitance for proper operation. The minimum amount of required output varies depending on the output voltage. See Table 1 for the required output capacitance.

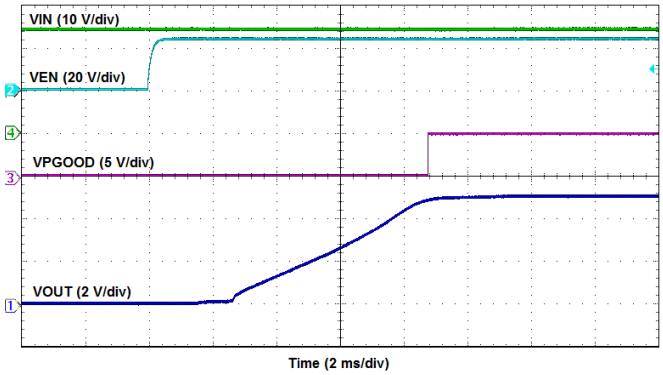
For this design example, four 22 µF, 25 V ceramic capacitors are used.

8.2.2.7 Application Curves



V_{IN} = 24 V V_{OUT} = 5 V I_{OUT} = 0.5 A to 1 A
C_{OUT} = 4 × 22 µF Slew rate: 1 A/µs

Figure 31. Transient Response



V_{IN} = 24 V V_{OUT} = 5 V C_{OUT} = 4 × 22 µF

Figure 32. Enable Turn-on

9 Power Supply Recommendations

The LMZM33602 is designed to operate from an input voltage supply range between 4 V and 36 V. This input supply must be well regulated and able to withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail must be low enough that an input current transient does not cause a high enough drop at the LMZM33602 supply voltage that can cause a false UVLO fault triggering and system reset.

If the input supply is located more than a few inches from the LMZM33602 additional bulk capacitance may be required in addition to the ceramic bypass capacitors. The typical amount of bulk capacitance is a 100-µF electrolytic capacitor.

10 Layout

The performance of any switching power supply depends as much upon the layout of the PCB as the component selection. The following guidelines will help users design a PCB with the best power conversion performance, optimal thermal performance, and minimized generation of unwanted EMI.

10.1 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 33 thru Figure 36, shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- **Connect PGND pins 14 and 15 directly to pin 18 using thick copper traces.**
- Connect the SW pins together using a small copper island under the device for thermal relief.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Keep AGND and PGND separate from one another.
- Place R_{FBT}, R_{FBB}, R_{RT}, and C_{FF} as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.

10.2 Layout Examples

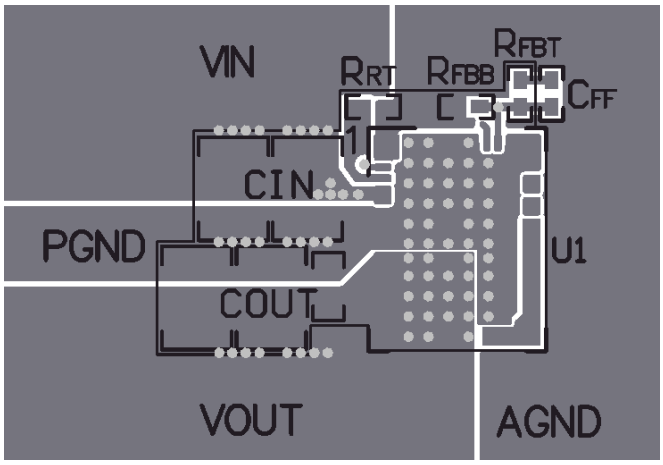


Figure 33. Typical Top-Layer Layout

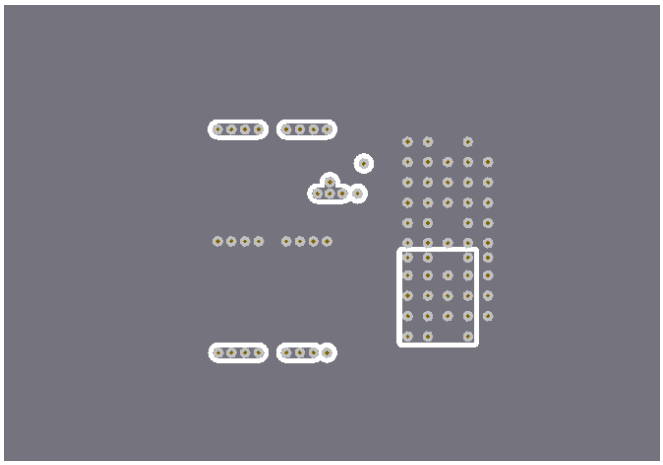

Figure 34. Typical Layer-2 Layout

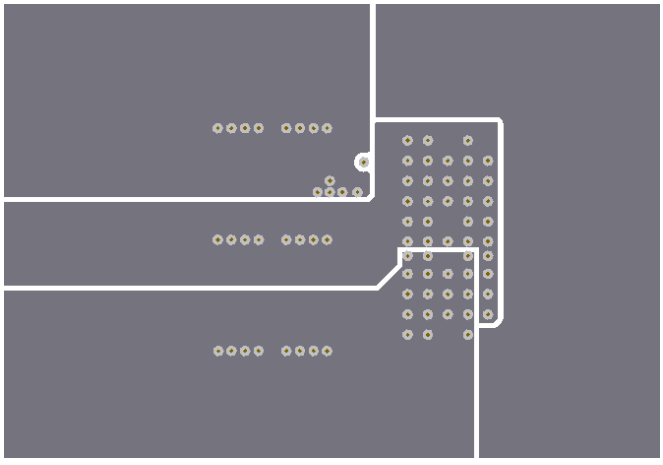

Figure 35. Typical Layer 3 Layout

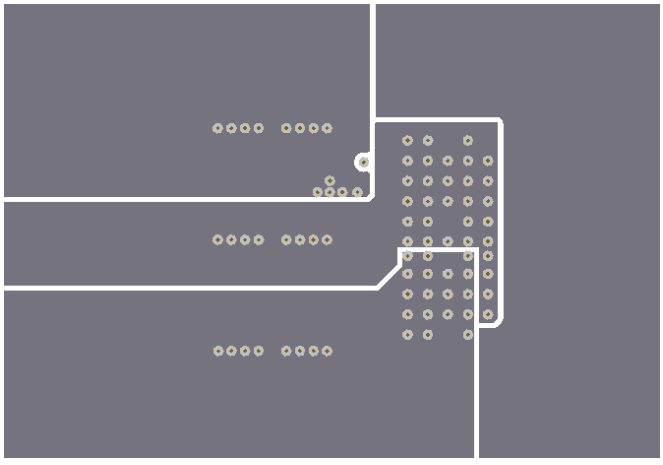

Figure 36. Typical Bottom-Layer Layout

10.3 Theta JA vs PCB Area

The amount of PCB copper effects the thermal performance of the device. Figure 37 shows the effects of copper area on the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the LMZM33602. The junction-to-ambient thermal resistance is plotted for a 2-layer PCB and a 4-layer PCB with PCB area from 16 cm^2 to 49 cm^2.

To determine the required copper area for an application:

1. Determine the maximum power dissipation of the device in the application by referencing the power dissipation graphs in the *Typical Characteristics* section.
2. Calculate the maximum θ_{JA} using Equation 5 and the maximum ambient temperature of the application.

$$\theta_{JA} = \frac{(125^{\circ}C - T_{A(max)})}{P_{D(max)}} \ (^{\circ}C/W) \tag{5}$$

3. Reference Figure 37 to determine the minimum required PCB area for the application conditions.

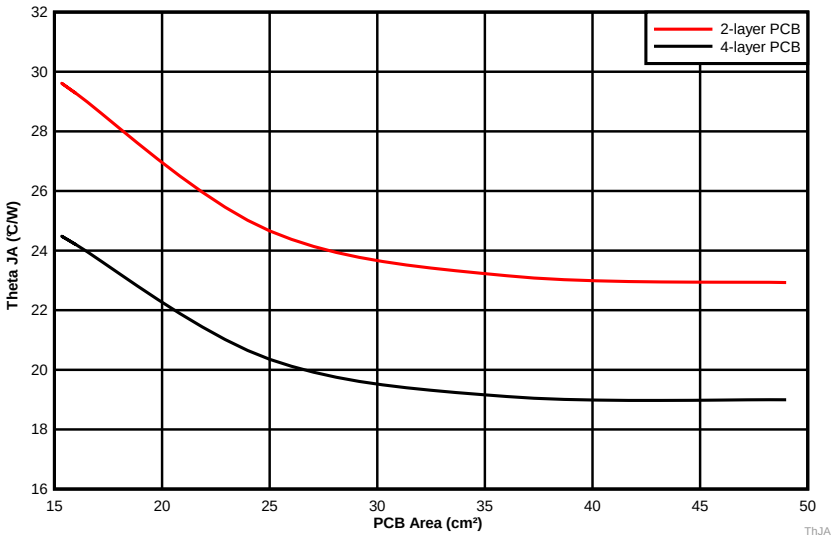

Figure 37. θ_{JA} vs PCB Area

10.4 EMI

The LMZM33602 is compliant with EN55011 Class B radiated emissions. Figure 38, Figure 39, and Figure 40 show typical examples of radiated emissions plots for the LMZM33602. The graphs include the plots of the antenna in the horizontal and vertical positions.

10.4.1 EMI Plots

EMI plots were measured using the standard LMZM33602EVM with no input filter.

LMZM33602RLRR	ACTIVE	B2QFN	RLR	18	500	RoHS & Green	CU NIPDAU	Level-3-250C-168 HR	-40 to 105	LMZM33602	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
