

Overview

LP2188A is a high-efficiency and high-precision non-isolated step-down switching power supply constant voltage control driver chip. It is suitable for non-isolated Buck and Buckboost topologies with a full range of input voltages from 85VAC to 265VAC, and is especially suitable for driving power supplies such as small appliances and white appliances.

LP2188A integrates high-voltage power tubes and adopts constant voltage control mode. The system can work in CCM and DCM modes. It adopts a unique PFM control method to improve audio characteristics.

Built-in unique peak current control, no CS resistor required; built-in startup circuit, no startup resistor required. Simple peripheral application and high reliability.

LP2188A has multiple protection functions, including VCC clamping/undervoltage protection, output short circuit protection, inductor overcurrent protection and over-temperature protection.

LP2188A adopts SOP7L

Typical Applications

Features

- Integrated 750V power tube
- Constant voltage control, fixed 5V output voltage
- Built-in unique peak current control, no CS resistor required
- Built-in startup circuit, no startup resistor required
- Excellent dynamic performance
- Excellent EMI characteristics
- Low standby output load regulation rate
- Excellent power consumption <75mW
- Multiple audio characteristics in the full load range
- Multiple protection functions

application

- Open power supplies such as small appliances and white appliances

Ordering Information

Order model	Encapsulation	Packaging	seal
LP2188A	SOP7L	Taping 4000 pcs/reel	LP2188 Axxx

\*xxx: batch number

## Pin package

Figure 2 Pin package diagram

## Seal Description:

X: The first letter represents the year, A: 2014, B: 2015, C: 2016, D: 2017... and so on in sequence

X: The second number or letter represents the week number. Week 1: 1, 2, 3, 4, 5, 6, 7, 8, and so on to Week 9: 9. Starting from Week 10,

Capital letters AB C...Z, and so on. "Z" represents the 35th week. Starting from the 36th week, lowercase letters abcd...z are used, and so on.

Last week of the year.

XX: The third and fourth digits represent the internal serial number

## Pin Description

serial number	Pin Name	describe
1	VOUT	feedback signal detection and power supply
2	GND	Feedback
3	NC	Dangling
4	C	The collector C of the built-in power transistor
5/6	ICG	Chip Ground
8	VCC	Chip power supply

## Limit parameters (Note 1)

symbol	parameter	Parameter Range	Unit
VCC	power supply voltage and feedback signal detection pin power	-0.3~7	V
PD <sub>MAX</sub>	consumption (Note 2)	0.45	IN
θ <sub>JA</sub>	Thermal resistance from PN junction to ambient	120	°C/W
T <sub>J</sub>	Operating junction temperature range	-40 to 150	°C
TSTG	storage temperature range	-55 to 150	°C
	ESD (Note 3) Note 1:	±2	KV

The maximum limit value means that if the chip is exceeded, it may be damaged. The recommended operating range means that within this range, the device functions normally, but it is not completely guaranteed.

Electrical parameters define the DC and AC voltage behavior of a device within its operating range and under test conditions that guarantee specific performance indicators.

Parameter specification. For parameters without upper and lower limits, the specification does not guarantee their accuracy, but their typical values reasonably reflect the device performance.

Note 2: The maximum power dissipation will decrease as the temperature rises, which is also determined by T<sub>JMAX</sub>, θ<sub>JA</sub>, and the ambient temperature T<sub>A</sub>. The maximum allowable power dissipation is PD<sub>MAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>) / θ<sub>JA</sub> or the lower value of the number given in the extreme range.

θ<sub>JA</sub> or the lower value of the number given in the extreme range.

Note 3: Human body model, 100pF capacitor discharged through 1.5kΩ resistor.

## Recommended working range

chip	parameter	Parameter Range	Unit
LP2188AA	I <sub>o</sub> @ V <sub>o</sub> =5V (Input voltage: 85VAC~265VAC@temperature rise θ <sub>Ty</sub> 55°C)	±200	mA

Electrical parameters (Note 4, 5) (Unless otherwise specified, VCC = 5V, TA = 25°C)

symbol	describe	condition	Minimum	Typical Value	maximum value	unit
Supply voltage						
VCC_ST	VCC startup voltage	VCC rises	3.60	4.10	4.60 V	
VCC_UVLO	VCC undervoltage protection threshold	VCC drops	2.20	2.55	2.90 V	
VCC_CLAMP	VCC clamp voltage	ICC=20mA	5.55	5.9	6.25 V	
IS	VCC startup current	VCC= VCC-ST- 0.5V			3	uA
ICC	VCC operating current	VCC=4.8V			1100 uA	
Constant pressure control						
VCC_REG	Constant pressure feedback control threshold value		5.23	5.38	5.53 V	
Peak current control						
IPK_MAX	Maximum peak current		370	395	415 mA	
IPK_MIN	minimum peak current leading			120		mA
TLEB	edge blanking time			350		ns
Operating frequency						
FSWMAX	maximum operating frequency		38	44	50 KHz	
FSWMIN	minimum operating frequency	No load		2.5		KHz
JUDGE	Frequency jitter ratio			±7		%
Protection function						
VVCC_HICCUP	output short circuit protection $V_o < VVCC\_HICCUP$	&88ms		3.5		V
IL_OCP	inductor over-current protection $IL\_OCP > 1.50 * IPK\_MAX$	&7 cycles output over-current		580		mA
IOCP		$I_o > IOCP$ , short circuit	260			mA
TON_MAX	Maximum on-time Maximum on-time limit Maximum duty cycle Maximum			18		us
DON_MAX	duty cycle limit				50 %	
TSD	Overheat protection temperature			150		°C
THYS	Over temperature protection hysteresis			30		°C
Built-in power transistor						
VCBO	C, B voltage	IC=0.1mA	750			V
ICESAT	C, E Saturation current	IB = 40mA		450		mA

Note 4: Typical parameter values are measured at 25°C.

Note 5: The minimum and maximum specification ranges in the data sheet are guaranteed by testing, and the typical values are guaranteed by design, testing or statistical analysis.

## Application Information

LP2188A is a high-efficiency and high-precision non-isolated step-down switching power supply constant voltage control driver chip. LP2188A integrates high-voltage power tubes and adopts constant voltage control mode. The system can work in CCM and DCM modes. It adopts a unique PFM control method to improve audio characteristics. The peripheral application is simple and the reliability is strong.

## start up

The chip only needs 1uA startup current. After the system is powered on, the capacitor of VCC is charged through the internal startup power supply circuit. When the VCC voltage reaches the chip startup threshold, the internal control circuit of the chip starts to work; at this time, the startup power supply circuit will continue to maintain the power supply, so that the output voltage can rise and establish normally. When the output voltage rises and works stably, VCC is powered by the output voltage.

## Constant pressure control

The constant voltage control is set by the VCC constant voltage feedback control threshold, and the calculation formula is as follows:

$$V_o = V_{-}$$

Where  $V_o$  is the output voltage and  $V_{CC\_REG}$  is the VCC constant voltage feedback control threshold (typical value 5.38V).

## PFM and peak current IPK control

PFM and peak current IPK control, as shown in Figure 4:

Phase 1: operating at the maximum peak current  $IPK\_MAX$  and the maximum operating frequency  $FSWMAX$ ;

Phase 2: Working at the maximum peak current  $IPK\_MAX$ , and the operating frequency decreases from the maximum operating frequency  $FSWMAX$  to 22KHz;

Stage 3: Working at 22KHz operating frequency, and the peak current gradually decreases from the maximum peak current  $IPK\_MAX$  as the load current decreases;

Stage 4: The peak current continues to decrease as the load current decreases, and decreases to the minimum peak current  $IPK\_MIN$ ; the operating frequency gradually decreases from 22KHz as the load current decreases;

Phase 5: Working at the minimum peak current  $IPK\_MIN$ ; the operating frequency continues to decrease as the load current decreases, decreasing to the minimum operating frequency  $FSWMIN$ ;

When no-load, it operates at the minimum peak current  $IPK\_MIN$ .

Figure 4

### Soft Start

As shown in Figure 5, the VCC capacitor is charged through the startup circuit, VCC reaches the startup voltage VCC\_ST, and the chip outputs a PWM switching signal; at this time, the output voltage begins to rise, and because the output voltage is still small, the VCC voltage will drop to 3.5V, and VCC is maintained at 3.5V through self-power supply.

The PWM switch signal goes through the following three stages, and the soft start ends. At the end of the soft start, the output voltage rises to VO\_MIN: if VO\_MIN > 3.5V, the chip works normally; if VO\_MIN < 3.5V, the chip output is short-circuit protected.

Figure 5

### 5V/200mA Buck System Parameter Recommendations

L 1mH

D 1% M7

CVCC: 1uF/10V, SMD

R1 1K $\Omega$

CVO > 220uF/10V

CVIN > 4.4uF/400V

### Protection function

Including VCC clamping/undervoltage protection, output short circuit protection, inductor overcurrent protection and over-temperature protection.

### PCB Design

When designing the LP2188A PCB, the following guidelines need to be followed:

VCC bypass capacitor CVCC:

CVCC needs to be close to the chip VCC and GND pins;

### Power loop area

Reduce the area of the power loop, such as the loop area of the power inductor, power tube, bus capacitor, as well as the loop area of the power inductor, freewheeling diode, and output capacitor, to reduce EMI radiation.

### C Pin

Appropriately increase the copper area of the C pin to improve chip heat dissipation.
