

## 300MHz to 11GHz Precision Dual RF Power Detector

### FEATURES

- Two Independent Temperature Compensated Schottky Diode RF Peak Detectors
- 45dB Channel-to-Channel Isolation at 2GHz
- Wide Input Frequency Range: 300MHz to 11GHz\*
- Wide Input Power Range: -32dBm to 12dBm
- Buffered Detector Outputs with Gain of 2x
- Adjustable  $V_{OUT}$  Starting Voltage
- Wide  $V_{CC}$  Range of 2.7V to 6V
- Low Operating Current: <math>500\mu\text{A}</math>/Channel
- Low Shutdown Current: <math>2\mu\text{A}</math>/Channel
- 4mm  $\times$  3mm DFN Package

### APPLICATIONS

- PA Forward and Reverse Power Monitor
- Dual PA Transmit Power Control
- 802.11a, b, g, 802.15, WiMAX
- PA Linearization
- Fixed Wireless Access
- RF Power Alarm
- Envelope Detector

### DESCRIPTION

The LTC<sup>®</sup>5533 is a dual channel RF power detector for RF applications operating in the 300MHz to 11GHz range. Two independent temperature compensated Schottky diode peak detectors and buffer amplifiers are combined in a small 4mm  $\times$  3mm DFN package.

The RF input voltage is peak detected using on-chip Schottky diodes. The detected voltage is buffered and supplied to the  $V_{OUT}$  pins. A power saving shutdown mode reduces current to less than 2 $\mu\text{A}$ /channel. The initial output starting voltages can be precisely adjusted using the  $V_{OS}$  pins.

The LTC5533 operates with input power levels from -32dBm to 12dBm.

**LT**, LTC and LT are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

\*Higher frequency operation is achievable with reduced performance. Consult factory for more information.

$RF_{IN}$ Input Frequency Range			300 to 11000		MHz
$RF_{IN}$ Input Power Range	RF Frequency = 300MHz to 7GHz (Note 5, 6) $V_{CC} = 2.7V$ to $6V$		-32 to 12		dBm
$RF_{IN}$ AC Input Resistance	$f = 1000MHz$ , $P_{in} = -25dBm$		220		$\Omega$
$RF_{IN}$ Input Shunt Capacitance	$f = 1000MHz$ , $P_{in} = -25dBm$		0.65		pF
Channel to Channel Isolation	$f = 2GHz$		45		dB

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Specifications over the  $-40^{\circ}C$  to  $85^{\circ}C$  operating temperature range are assured by design, characterization and correlation with statistical process controls.

**Note 3:** The rise time at  $V_{OUT}$  is measured between 1.3V and 2.3V.

**Note 4:** Bandwidth is calculated based on the 10% to 90% rise time equation:  $BW = 0.35/\text{rise time}$ .

**Note 5:** RF performance is production tested at 1800MHz

**Note 6:** Guaranteed by design.

## PIN FUNCTIONS

**V<sub>CC1</sub>, V<sub>CC2</sub> (Pins 1, 4):** Power Supply Voltage, 2.7V to 6V. V<sub>CC</sub> should be bypassed appropriately with ceramic capacitors.

**V<sub>OUT1</sub>, V<sub>OUT2</sub> (Pins 2, 5):** Detector Outputs.

**V<sub>OS1</sub>, V<sub>OS2</sub> (Pins 3, 6):** V<sub>OUT</sub> Offset Voltage Adjustments. These pins adjust the starting V<sub>OUT</sub> voltage when no RF signal is present. For V<sub>OS</sub> from 0V to 130mV, V<sub>OUT</sub> is unaffected by V<sub>OS</sub>. For V<sub>OS</sub> > 130mV, V<sub>OUT</sub> is the sum of V<sub>OS</sub> plus the detected RF signal.

**SHDN1, SHDN2 (Pin 10, 7):** Shutdown Inputs. A logic low on the SHDN pin places the corresponding detector in shutdown mode. A logic high enables the detector. SHDN

has an internal 160k pulldown resistor to ensure that the detector is shutdown when no SHDN input is applied. In shutdown V<sub>OUT</sub> is connected to ground via a 280Ω resistor. Channels can be shut down independently.

**GND1, GND2 (Pins 11, 8):** Ground.

**RF<sub>IN1</sub>, RF<sub>IN2</sub> (Pins 12, 9):** RF Input Voltage. Referenced to V<sub>CC</sub>. A coupling capacitor must be used to connect to the RF signal source. These pins have internal 500Ω terminations, Schottky diode detectors and peak detector capacitors.

**Exposed Pad (Pin13):** Ground.

## BLOCK DIAGRAM (One Channel)

## APPLICATIONS INFORMATION

### Operation

The LTC5533 contains two RF detector dice in one package forming two independent RF detector channels. Each channel provides RF power detection over frequencies ranging from 300MHz to 11GHz. Channel functions include an internal frequency compensated buffer amplifier with the gain set to 2x, an RF Schottky diode peak detector and level shift amplifier to convert the RF input signal to low frequency and a delay circuit to avoid voltage transients at  $V_{OUT}$  when powering up. The LTC5533 has both shutdown and starting voltage adjustment capabilities.

### Buffer Amplifiers

The output buffer amplifiers are capable of supplying typically 4mA into a load. These amplifiers have bandwidths of 2MHz and a fixed internal gain of two.

The  $V_{OS}$  inputs control the DC input voltages to the buffer amplifiers.  $V_{OS}$  must be connected to ground if the DC output voltage is not to be changed. The buffers are initially trimmed to approximately 130mV with  $V_{OS}$  connected to ground.

The  $V_{OS}$  pins are used to change the initial  $V_{OUT}$  starting voltage. This function enables the LTC5533 outputs to

span the input range of a variety of analog-to-digital converters.  $V_{OUT}$  will not change until  $V_{OS}$  exceeds 130mV. The voltage at  $V_{OUT}$  for  $V_{OS} > 130mV$  and with no RF signal present is:

$$V_{OUT} = V_{OS}$$

$V_{OUT}$  will track  $V_{OS}$  above 130mV.

### RF Detectors

The internal RF Schottky diode peak detectors and level shift amplifiers convert the RF input signals to a low frequency signal. The detectors demonstrate excellent efficiency and linearity over a wide range of input power. The Schottky diodes are biased at about 55 $\mu$ A and drive 25pF internal peak detector capacitors.

### Applications

The LTC5533 can be used as a self-standing signal strength measuring receiver for a wide range of input signals from -32dBm to 12dBm for frequencies from 300MHz to 11GHz. Operation at higher frequencies is achievable with reduced performance. Consult factory for more information. Figure 1 plots the output voltage as a function of RF input power of an 11GHz CW input signal.

Demo Board Schematic

APPLICATIONS INFORMATION

Figure 1. Typical Detector Characteristics, 11GHz

Figure 2.  $V_{OUT}$  Slope vs RF Input Power at 11GHz

Figure 3.  $V_{OUT}$  Variation at  $-40^{\circ}\text{C}$  and at  $85^{\circ}\text{C}$  vs RF Input Power at 11GHz, Normalized to Room Temperature ( $25^{\circ}\text{C}$ ) Results.

Figure 2 shows the corresponding slope of the 11GHz response, and Figure 3 shows the variation of the output voltage vs RF input power at  $-40^{\circ}\text{C}$  and  $85^{\circ}\text{C}$ , normalized to the room temperature ( $25^{\circ}\text{C}$ ) results.

The LTC5533 can be used as a demodulator for AM and ASK modulated signals with data rates up to 2MHz. Depending on specific application needs, the detector outputs can be split between two branches, providing AC-coupled data (or audio) output and a DC-coupled RSSI output for signal strength measurements and AGC.

The LTC5533 can also be used for RF power detection and control. Figure 4 is an example of an LTC5533 used for dual band mobile phone transmitter power control.

The LTC5533 consists of two separate RF detector dice packaged together. Consequently, detector-to-detector isolation is good—typically 45dB at 2GHz. Output matching is good, but not precise. The characterization plots in the Typical Performance Characteristics show that the typical output voltage mismatch is within  $\pm 25\text{mV}$  with no RF input signal present. With  $-14\text{dBm}$  RF input signal, the typical equivalent mismatch is within  $\pm 1\text{dB}$ .

Figure 4. Dual Band Mobile Phone Transmitter Power Control with LTC5533

# PACKAGE DESCRIPTION

## DE Package 12-Lead Plastic DFN (4mm × 3mm) (Reference LTC DWG # 05-08-1695)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS

NOTE:

1. DRAWING PROPOSED TO BE A VARIATION OF VERSION (WGED) IN JEDEC PACKAGE OUTLINE M0-229
2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE
